1 April 2019 **LIR 190401001**

US Adversaries Exploit Social Media Information to Target US Individuals and Government Clearance Holders

The FBI's Washington Field Office, in coordination with the FBI's Office of Private Sector (OPS), is informing private sector partners regarding foreign intelligence services' (FIS) exploitation of social media platforms[a] and data to target corporate and US government (USG) clearance holders. FIS and US adversary intelligence officers are using popular US-based social media platforms to identify, recruit, and conduct operations against USG clearance holders, to include private sector employees or contractors supporting the USG. FIS officers will use popular US-based platforms and their respective countries' social media platforms for personal and intelligence gathering/operations purposes.

The FBI reminds US clearance holders and/or individuals with access to US sensitive/proprietary information to remain vigilant, and adhere to strict operational security protocols in their physical and online presence. Increasing physical and online operational security awareness, using best practices, and training may limit FIS solicitation attempts/activities. Visit the FBI's Domestic Security Alliance Council, InfraGard, and the FBI's Counterintelligence homepage for information and brochures related to FIS, as well as, material on insider threat awareness:

- www.fbi.gov/investigative/counterintelligence
- www.dsac.gov
- www.infragard.org

FIS Primary Targets: Former/Active USG Clearance Holders

In 2017, an FIS used a popular professional networking website to contact a former USG employee who held an expired Top Secret level clearance. The employee listed their intelligence/national security background on their website profile. A separated but recruited individual later acted as the "middleperson" who introduced the employee to the FIS. In February 2017, the employee traveled overseas to meet the FIS and established a covert communication channel. That communication channel served as a mean to pass Secret and Top Secret information to a US adversary. In mid-2017, the USG arrested and charged the employee for conducting espionage against the United States.

FIS Private Sector Targets: USG Contractor Clearance Holders

A known FIS front company used a publicaly available employment website to target USG defense contractors who posted their resume online. The FIS used the website to target, assess, and recruit

[a] The term **social media platform** refers to as a broad range of private to public communication, employment networking, interaction, and file sharing featured tool via websites, as well as, applications on smart-devices and/or computer systems.

employees of US-based defense contracting companies supporting the USG who have specialized skills in the aviation technology.

Social Engineering Method: FIS use Fictitious Social Media Accounts to Obtain Access to Sensitive and Classified Data from USG and Corporate Employee

An FIS created a fictitious US military social media profile on several platforms. The FIS used the profile to establish online relationships/social network with a wide range of USG, US military personnel, and multiple US-based cleared defense contractors. The FIS used the social network to develop and assess a targeted pool of profiles.

Bridging the Physical and Online Introductions Gap: FIS Used Physical Events and Online Research for Social Media Usage to Establish Relationships

In early 2018, a US-based cleared defense contractor with a Top Secret level clearance attended a technical trade show conference in the United States. An FIS who operated a vender booth at the conference approached the contractor several times and offered sales of products/services. As a means to deter the aggressive sales pitches, the contractor indicated to the FIS his/her affiliation with the USG and offered the FIS a business card. A week after the conference, the FIS located the contractor on a popular professional linking website. The FIS sent an online request to the contractor via the website. The FIS is likely associated with an identified US adversarial military unit.

This LIR was disseminated from OPS's Information Sharing and Analysis Unit. Direct any requests and questions to your FBI Private Sector Coordinator at your local FBI Field Office: https://www.fbi.gov/contact-us/field-offices

OFFICE of PRIVATE SECTOR

LIAISON INFORMATION REPORT (LIR)

Traffic Light Protocol (TLP) Definitions

Color	When should it be used?	How may it be shared?
TLP:RED Not for disclosure, restricted to participants only.	Sources may use TLP:RED when information cannot be effectively acted upon by additional parties, and could lead to impacts on a party's privacy, reputation, or operations if misused.	Recipients may not share TLP:RED information with any parties outside of the specific exchange, meeting, or conversation in which it was originally disclosed. In the context of a meeting, for example, TLP:RED information is limited to those present at the meeting. In most circumstances, TLP:RED should be exchanged verbally or in person.
TLP:AMBER Limited disclosure, restricted to participants' organizations.	Sources may use TLP:AMBER when information requires support to be effectively acted upon, yet carries risks to privacy, reputation, or operations if shared outside of the organizations involved.	Recipients may only share TLP:AMBER information with members of their own organization, and with clients or customers who need to know the information to protect themselves or prevent further harm. **Sources are at liberty to specify additional intended limits of the sharing: these must be adhered to.**
TLP:GREEN Limited disclosure, restricted to the community.	Sources may use TLP:GREEN when information is useful for the awareness of all participating organizations as well as with peers within the broader community or sector.	Recipients may share TLP:GREEN information with peers and partner organizations within their sector or community, but not via publicly accessible channels. Information in this category can be circulated widely within a particular community. TLP:GREEN information may not be released outside of the community.
TLP:WHITE Disclosure is not limited.	Sources may use TLP:WHITE when information carries minimal or no foreseeable risk of misuse, in accordance with applicable rules and procedures for public release.	Subject to standard copyright rules, TLP:WHITE information may be distributed without restriction.

CI Cyber Authorities Legal Briefing

Sept 2016

U.S. AIR FORCE

Overview

- Legal Framework
- DoDM 5240.01 Overview
- Computer Trespasser Exception
- Scenarios

Page 24 of 3957

CI Cyber Legal Framework

Legal Framework—The Basics

- U.S. Constitution
- U.S. Code
  - FISA
  - ECPA
  - Computer Fraud and Abuse Act
  - Computer Trespasser Exception
  - National Security Letters
- Executive Order 12333
- DoD/USAF Issuances
  - DoDM 5240.01 (Procs 1-10)
  - DoD 5240.1-R (Procs 11-15)
  - AFI 71-101 v4

Legal Framework—History

- Spying is one of the oldest professions
  - General George Washington noted during the War of Independence "it was the British spies he feared the most."

- Today's laws and policies are the direct result of unfettered intelligence collection by DoD, FBI and CIA in the 1960's and 1970's.
  - Physical surveillance of public figures involved with the anti-Vietnam war and civil rights protests, e.g., MLK
  - Mail openings
  - Break-ins of the offices, vehicles and houses of U.S. persons
  - Undisclosed participation on university campuses

Legal Framework—History

- The Church and Pike congressional committees found the IC lacked policy on how to conduct its mission in regards to U.S. persons
  - Recommended "reining" in Executive Branch powers in using intelligence elements against U.S. persons
  - Created the Permanent Select Committee on Intelligence (Senate) and the Congressional Committee on Intelligence
  - The Foreign Intelligence Surveillance Act was enacted in 1978
- Before Congress passed legislation to correct this deficiency, E.O. 11905 was signed, which was later replaced by E.O. 12333 (standing E.O. on Intelligence Oversight)

DoDM 5240.01 Overview

DoD MANUAL 5240.01

PROCEDURES GOVERNING THE CONDUCT OF DoD INTELLIGENCE ACTIVITIES

Originating Component	Office of the Deputy Chief Management Officer of the Department of Defense
Effective:	Month Day, Year
Releasability:	Cleared for public release. Available on the DoD Issuances Website at http://www.dtic.mil/whs/directives
Incorporates and Cancels:	Directive-type Memorandum 08-011, "Intelligence Oversight Policy Guidance," March 20, 2008 Procedures 1-10 of DoD 5240.1-R, "Procedures Governing the Activities of DoD Intelligence Components That Affect United States Persons," December 7, 1982
Approved by:	Loretta E. Lynch, Attorney General of the United States Ashton B. Carter, Secretary of Defense

Purpose: In accordance with the authority in DoD Directive 5240.01 and Executive Order (E.O.) 12333, this issuance:

- Establishes procedures to enable DoD to conduct authorized intelligence activities in a manner that protects the constitutional and legal rights and the privacy and civil liberties of U.S. persons. DoD authorized intelligence activities are foreign intelligence and counterintelligence (CI) activities unless otherwise specified in this issuance.
- Authorizes the Defense Intelligence Components to collect, retain, and disseminate information concerning U.S. persons in compliance with applicable laws, Executive orders, policies, and regulations.

Page 29 of 3957

DoDM 5240.01 Overview

- Signed by SecDef and Attorney General August 2016
- Replaces Procedures 1-10 of DoD 5240.01-R (December 1982)
- Ten (10) Procedures
  - Proc 2, Collection
  - Proc 3, Retention
  - Proc 4, Dissemination
  - Proc 5, Electronic Surveillance
  - Proc 6: Concealed Monitor
  - Proc 7, Physical Search
  - Proc 8, Mail Search/Cover
  - Proc 9, Physical Surveillance
  - Proc 10, Undisclosed Participation

DoDM 5240.01, Counterintelligence

- **Defined: Information gathered and activities conducted to *identify, deceive, exploit, disrupt,* or *protect* against espionage, other intelligence activities, sabotage, or assassinations conducted for or on behalf of foreign powers, organizations, or persons, or their agents, or international terrorist organizations or activities.**

Procedure 2, Introduction

- **Intentional Collection of USPI: We may *intentionally* collect USPI *only* if:**
  - **the information sought is *reasonably believed* to be *necessary* for the performance of an authorized counterintelligence mission;**
  - **the USPI falls within one of the following 13 categories below; and**
  - **we use the least intrusive means.**

- **U.S. Person Information (USPI) defined: Information that is reasonably likely to identify one or more specific U.S. persons.**

- **Collection takes place upon receipt**
  - **Regardless of when you use it**
  - **Computers can collect**
  - **Intel is collected only once**
  - **May be disseminated multiple times**
  - **Encrypted data is considered collected upon receipt**

Procedure 2, Reasonable Belief

- **Defined: When the facts and circumstances are such that a reasonable person would hold the belief.**
  - **Must rest on facts and circumstances that can be articulated;**
  - **Hunches or intuitions are not sufficient; and**
  - **Can be based on experience, training, and knowledge of CI activities as applied to particular facts and circumstances.**

Procedure 2 Categories

1. Publicly Available
2. Consent
3. Foreign Intelligence (FI)
4. Counterintelligence (CI)
5. Threats to Safety
6. Protection of Sources/Methods
7. Current, Former, or Potential Sources
8. Persons in Contact With Sources or Potential Sources
9. Personnel Security
10. Physical Security
11. Communications Security
12. Overhead and Airborne Reconnaissance
13. Administrative Purposes

Procedure 2 Categories

1. **Publicly Available Information**
2. **Consent**
   - **Defined: An agreement by a person or organization to permit a Defense Intelligence Component to take particular actions affecting that person or organization.**
   - **The legal advisor [OSI/JA] will determine whether a notice or policy is adequate and lawful, before the Component takes or refrains from taking action on the basis of implied consent.**
3. **Foreign Intelligence**

Procedure 2 Categories

4. **Counterintelligence: The information is *reasonably believed* to constitute CI and the U.S. person is one of the following:**
   - (a) **An individual, organization, or group reasonably believed to be engaged in or preparing to engage in espionage, other intelligence activities, sabotage, or assassination on behalf of a *foreign* power, organization, or person, or on behalf of an agent of a *foreign* power, organization, or person;**
   - (b) **An individual, organization, or group reasonably believed to be engaged in or preparing to engage in international terrorist activities;**
   - (c) **An individual, organization, or group reasonably believed to be acting for, or in furtherance of, the goals or objectives of an international terrorist or international terrorist organization, for purposes harmful to the national security of the United States; or**
   - (d) **An individual, organization, or group *in contact with a person described above* for the purpose of identifying such individual, organization, or group and assessing any relationship with the person described therein.**

Procedure 2, Other

- **Special Circumstances Collection**
  - Defense Intelligence Components will consider whether collection opportunities raise special circumstances based on the volume, proportion, and sensitivity of the USPI likely to be acquired, and the intrusiveness of the methods used to collect the information.
- **Amount of Information Collected**
  - In collecting non-publicly available USPI, to the extent practicable, collect no more information than is reasonably necessary.
- **Least Intrusive Means**
  - Use the least intrusive collection techniques feasible within the United States or directed against a U.S. person abroad.
    1. Publicly available sources or with the consent of the person concerned
    2. Cooperating sources
    3. Techniques that do *not* require a judicial warrant or AG approval
    4. Techniques that do require a judicial warrant or AG approval

Procedure 3, Retention

- **Permanent Retention standard**
  - Retention is reasonably believed to be necessary for the performance of an authorized intelligence mission; and
  - The information was lawfully collected or disseminated to the Component
    - Meets one of the 13 collection categories; or
    - Is necessary to understand or assess CI, e.g., information about a U.S. person that provides important background or context for CI.

Procedure 3, Retention

- Three primary evaluation periods to determine retention of USPI
  - Promptly
  - Five (5) years
  - Twenty-five (25) years

- Intentional Collection of USPI
  - Must be evaluated promptly; and
  - If *necessary*, may retain the information for evaluation for up to 5 years, subject to extension.

Procedure 3, Retention

- **Incidental Collection of USPI**
  - Defined: collection of USPI that is not deliberately sought, but is nonetheless collected
  - *In the United States,* may retain all of the incidentally collected information for evaluation for up to 5 years, unless extended
  - *Outside the United States, may* retain all of the incidentally collected information for evaluation for up to 25 years.

- **Voluntarily Provided USPI**
  - About a U.S. person, evaluate the information promptly, up to 5 years, unless extended.
  - About a non-U.S. person, evaluation for up to 25 years.

Procedure 3, Retention

- **Unintelligible information**
  - The time periods begin when the information is processed into intelligible form
  - Includes information that a Component cannot decrypt or understand in the original format.
  - To the extent practicable, unintelligible information will be processed into an intelligible form.
  - A foreign language is considered intelligible

- **Deletion of Information.**
  - Unless the standards for permanent retention are met, must delete all USPI from the Component's automated systems of records.

Procedure 4, Dissemination

- We may disseminate USPI based upon the following criteria:
  - Any person or entity: Information is publicly available or U.S. person has consented to the dissemination.
  - Other intelligence community elements
  - Other DoD elements; federal government entities; state, local, tribal, or territorial governments: recipient is reasonably believed to have a need to receive such information for the performance of its lawful missions or functions.
  - Foreign governments or international organizations
    - Recipient is reasonably believed to have a need to receive such information for its lawful missions or functions; and
    - Disclosure is consistent with applicable international agreements and foreign disclosure policy
  - Protective Purposes: Necessary to protect the safety or security of persons or property, or to protect against or prevent a crime or threat to the national security.

Procedure 5, Electronic Surveillance

- Implements FISA and E.O. 12333
- Defined
  - The installation or use of any monitoring device in the United States where a person has a reasonable expectation of privacy, as determined by *OSI/JA*, and
  - A warrant would be required for law enforcement purposes.
- Fourth Amendment
  - All electronic surveillance must comply with the Fourth Amendment
  - *OSI/JA* will assess the reasonableness of collection, retention, and dissemination

Procedure 5, Electronic Surveillance

- In the United States
  - Attorney General or the Foreign Intelligence Surveillance Court (FISC) may authorize, except for emergency situations.
  - May only conduct such surveillance if both:
    - A *significant purpose* of the electronic surveillance is to obtain foreign intelligence information; and
    - There is probable cause to believe that the target of the electronic surveillance is a foreign power or an agent of a foreign power.

Procedure 5, Electronic Surveillance

- Outside the United States
  - U.S. person
    - Governed by FISA and E.O. 12333; or
    - Approval under exigent circumstances exception
  - Non-U.S. person: governed by Title I or Section 702
- Emergency situations: Attorney General approval
- Technical Surveillance Countermeasures (TSCM)
  - Applies to the use of electronic equipment and specialized techniques to determine the existence and capability of electronic surveillance equipment being used by persons not authorized to conduct electronic surveillance.

Procedure 6, Concealed Monitoring

- **Defined as the following:**
  - Hidden electronic, optical, or mechanical devices,
  - to monitor a particular person or a group of persons,
  - without *consent*,
  - in a surreptitious manner,
  - over a period of time, and
  - no *reasonable expectation of privacy*.
- **Examples**
  - Video monitoring or sound recording of a subject in a place where he or she has no reasonable expectation of privacy if conducted over a period of time
  - Taking one photograph of a subject would ***not*** qualify.

Procedure 6, Concealed Monitoring

- **Scope**
  - ***Any*** **person inside the United States, or**
  - **Any U.S. person outside the United States**
- **In the United States**
  - **On DoD facilities**
  - **Outside DoD facilities, after coordination with the FBI.**
- **Outside the United States**
  - **On DoD facilities**
  - **Outside DoD facilities must be coordinated with the CIA, and appropriate host country officials in accordance with any applicable SOFA or other international agreement.**

Procedure 6, Concealed Monitoring

- Approval: AFOSI/CC or delegee
- OSI/JA will determine whether the following criteria have been met:
  - There is no reasonable expectation of privacy;
  - Such monitoring is necessary to conduct an assigned CI function;
  - A trespass will not be necessary to effect the monitoring; and
  - The monitoring is not subject to Procedure 5

Procedure 7, Physical Searches

- Scope: Applies to *nonconsensual* physical searches in the United States *and* of U.S. persons/property outside the United States.
- Defined: Any intrusion on a person or property that would require a *warrant* for law enforcement purposes.
- Does *not* include examinations of
  - Areas that are in plain view and visible to the unaided eye if there is no physical trespass;
  - Publicly available information;
  - Abandoned property in a public place;
  - Items where we have consent; and
  - Government property pursuant to Military Rule of Evidence 314(d)

Procedure 7, Physical Searches

- **Active duty**
  - Approval: Attorney General or FISC
- **Other persons inside the United States**
  - We may *NOT* conduct searches of other persons
  - We may request the FBI to conduct such a search
- **Other U.S. persons outside the United States**
  - The search is for an authorized foreign intelligence or CI purpose;
  - The search is appropriately coordinated with the CIA; and
  - The FISC or the Attorney General has authorized the search.
  - Authority to Request
    - Does *not* include AFOSI/CC
    - SecDef, DSD, USD(I); SecAF; USecAF; DIRNSA/CHCSS; Director, DIA; Director, NGA; or Director, NRO

Procedure 8, Mail Searches and Cover

- **Mail Searches**
  - See Procedure 7

- **Mail cover**
  - In U.S. postal service channels, request the USPS IAW 39 CFR 233.3(e)(2)
  - In foreign postal channels, may request a mail cover for mail that is to or from a U.S. person consistent foreign law and any applicable SOFA

Procedure 9, Physical Surveillance

- **Who can we surveil in the United States:**
  - **Military service members;**
  - **Present or former military or civilian employees of a DIC;**
  - **Present or former contractors of a DIC;**
  - **Present or former employees of such a contractor;**
  - **Applicants for such employment or contracting;**
  - **Non-U.S. persons; and**
  - **Other persons, "when detailed to the FBI or when operating under FBI authorities."**

Procedure 9, Physical Surveillance

- **Scope**
  - Any person inside the United States or any U.S. person outside the United States.
  - Applies to any devices used to observe the subject of the surveillance (not Procedure 6).

- **Defined**
  - Deliberate and continuous observation of a person, and
  - Where the person has no reasonable expectation of privacy.
  - Does *not* apply to surveillance detection or counter surveillance used to detect and elude foreign physical surveillance

Procedure 9, Physical Surveillance

- **Approval and coordination**
  - **Approval: AFOSI/CC or delegee**
  - **Coordination**
    - **In the United States**
      - No coordination req'd for surveillance of active duty, on-base
      - FBI for off-base surveillance
      - FBI for surveillance on-base, non-active duty
    - **Outside the United States**
      - CIA for off-base surveillance
      - Consider with SOFA and foreign law/policy

Procedure 10, Undisclosed Participation (UDP)

- **Scope: Governs the *participation* by DICs and anyone acting on behalf of a DIC, e.g., sources, in any *organization* in the United States or any organization outside the United States that constitutes a U.S. person.**
- **Organization defined**
  - **An association of two or more individuals formed for any *lawful* purpose whose existence is formalized in some manner**
  - **Includes those that meet and communicate through the use of technologies**
- **Participation defined**
  - **When a person is tasked or asked to participate in an organization for the benefit of the DIC**
  - **Actions undertaken "for the benefit of" a DIC may include collecting information, identifying potential sources or contacts, or establishing or maintaining cover.**

Page 55 of 3957

Procedure 10, UDP

- **Exclusions**
  - Personal participation
  - Voluntarily provided information
  - Publicly available information on the Internet
    - Collection of publicly available information on the Internet in a way that does *not* require a person to provide identifying information (such as an email address) as a condition of access and does not involve communication with a human being.
- **Approval depends on the activity**
  - No specific level of approval
  - AFOSI/CC or delegee
  - AFOSI/CC or single delegee

Procedure 10, UDP

- **Standards for review and approval: approving official must make the following determinations:**
  - **The potential benefits to national security outweigh any adverse impact on civil liberties or privacy of U.S. persons.**
  - **The proposed UDP complies with the limitations on UDP; and**
  - **The proposed UDP is the least intrusive means feasible and conforms to the requirements of Procedure 2.**

Procedure 10, UDP

- UDP requiring no specific level of approval
  - Education or training
  - Cover Activities: Participation in an organization solely for the purpose of obtaining or renewing membership status *in accordance with DoD cover policy*
  - Published or posted information: Participation in an organization whose membership is open to the public solely for the purpose of obtaining information published or posted by the organization or its members and generally available to members; must not involve elicitation.
  - Public forums: Employment affiliation not required and no elicitation of USPI; and
  - Foreign entity

Procedure 10, UDP

- **UDP That May Be Approved by a DIC Head or Delegee**
  - **Non-U.S. persons as potential sources of assistance**
  - **Public forums: employment affiliation required or elicitation of USPI may be authorized**
  - **Cover activities beyond obtaining or renewing membership for the purpose of maintaining or enhancing cover**
  - **U.S. person organizations outside the United States involving participation from or about a non-U.S. person located outside the United States.**

Procedure 10, UDP

- **UDP That May Be Approved by a Defense Intelligence Component Head or a Single Delegee**
  - To conduct authorized CI activities not otherwise addressed in or outside the United States, after required coordination with the FBI or CIA.
  - To collect information inside the United States necessary to identify a U.S. person as a potential source of assistance to foreign intelligence or CI activities.
  - To collect information outside the United States necessary to assess a U.S. person as a potential source of assistance to foreign intelligence or CI activities.

Cyber Authorities

- Data at Rest
  - The Stored Communications Act (SCA)
- Live data
  - Pen Register/Trap & Trace Act
  - The Wiretap Act

Stored Communications Act

- Stored Communications Act (SCA), 18 U.S.C. §§ 2701-2712
  - Provides statutory and procedural protections to customer records and contents of communications when held in electronic storage
  - Electronic storage: "any temporary, intermediate storage of a wire or electronic communication incidental to the electronic transmission thereof"
- Applies to all electronic communications services, e.g., Yahoo, Google, and military networks

Stored Communications Act

- § 2701 prohibits ***unauthorized access*** to stored communications
- Service provider exception
  - Allows person or entity providing a wire or electronic communications service to access stored communications, e.g., sys ads
- Q: Ever wonder how Google knows that you're in the market for . . . a feng shui brass rooster?

Stored Communications Act

- § 2702. Disclosure of Contents
  - Prohibits a person or entity providing an electronic communication service [ECS] ***to the public*** from releasing the contents of a communication while in electronic storage by that service; and
  - Prohibits a person or entity providing remote computing service [RCS] ***to the public*** from releasing the contents of any communication which is carried or maintained on that service

Stored Communicatio!

- Strict requirements apply to public service providers only, per 18 U.S.C. § 2702
- DoD is not a public service provider. See Andersen Consulting LLP v. UOP, 991 F. Supp. 1041 (N.D. IL 1998)
- In theory, no substantial limits for DoD system admins when accessing s communications on our networks

Stored Communications Act

- To gain access to most records of interest, LE needs to either obtain a *search warrant* or a § 2703(d) order (used when the records are "relevant and material to an ongoing criminal investigation")
- These must be obtained from a "court of competent jurisdiction"
  - Excludes military courts

SCA, Compelled Disclosure, 18 USC § 2703

Information Sought	Public Provider	Non-Public
Basic subscriber, session, and billing information	Subpoena; 2703(d) order; or search warrant § 2703(c)(2)	Subpoena; 2703(d) order; or search warrant § 2703(c)(2)
Other transactional and account records	2703(d) order or search warrant § 2703(c)(1)	2703(d) order or search warrant § 2703(c)(1)
Retrieved communications and the content of other stored files	Subpoena with notice; 2703(d) order with notice; or search warrant § 2703(b)	Subpoena; SCA does not apply § 2711(2)
Unretrieved communications, including email and voice mail (in electronic storage *more than 180 days*)	Subpoena with notice; 2703(d) order with notice; or search warrant § 2703(a), (b)	Subpoena with notice; 2703(d) order with notice; or search warrant § 2703(a), (b)
Unretrieved communications, including email and voice mail (in electronic storage *180 days or less*)	Search warrant § 2703(a)	Search warrant § 2703(a)

SCA Practice Tips

If an electronic communication may contain evidence relevant to the investigation:

- **Immediately send a preservation request to the provider (renew for 90 days)**
- **Work with local US Attorney's office to obtain a search warrant or court order from a Federal District Court**
- **For subscriber information, i.e., non-content, trial counsel and/or DoD IG subpoena is sufficient**

Real-Time "Live" Data

- Pen Register / Trap & Trace (non-content)
- Wiretap Act (content)

Pen Register / Trap & Trace

- Pen/Trap captures all ***non-content*** information in a communication, i.e., meta data (address on an envelope)
  - Requires a court order, unless an exception met

- Initially applied to telephones only
  - Pen Register: records numbers dialed *from* a particular phone, e.g., 867-5309
  - Trap & Trace: records what numbers dialed *to* a particular phone, i.e., caller ID

- Now includes land lines, cell phones, internet user accounts, email accounts, and IP addresses

Pen Register / Trap & Trace

- Permits providers or wire communication services authority to use pen/trap devices on their own networks without a court order
  - Perform operation, maintenance, and testing
  - Protect provider's property
  - Protect users from abuse / unlawful use of service

- On AFIN, would also apply to "proxy logs" containing records of web page activity

Wiretap Act

The Wiretap Statute

- **Federal Wiretap Statute, 18 U.S.C. § 2510-2520**
  - **BLUF: Wiretapping is illegal, unless an exception applies**
  - **Broadly prohibits eavesdropping everywhere by people in the US (not just the government)**
  - **Wiretap defined: *intercepting communications* using an electronic, mechanical, or other device**
    - **"Communications" means content**
    - **"Intercept" means acquiring contemporaneously with transmission, i.e., "live or real-time" communication**
    - **Applies to Internet communications**
  - **Air Force is a provider of electronic communications services**

Wiretap Statute Exceptions

- Consent, § 2511(2)(c)-(d)
- Accessible to the public, § 2511(2)(g)(i)
- Court order, § 2518
- Service Provider Exception, § 2511(2)(a)(i)
- Computer Trespasser Exception, § 2511(2)(i)
- Extension telephone exception, § 2510(5)(a)
- Inadvertently obtained criminal evidence, § 2511(3)(b)(iv)

Service Provider Exception

- Applies to "provider[s] of electronic communication services"
- System providers are authorized to intercept, disclose, or use network communications to protect rights & property of the provider or to ensure the system continues to provide service
- Allows real-time monitoring w/o a warrant to improve service
  - For example, it is appropriate to scan (intercept) all incoming emails for malicious code, but it is likely not appropriate to scan all emails for certain words.

Computer Trespasser Exception

- This is the primary exception used by LE/CI (AFOSI), 18 USC § 2511
  - Investigators may monitor a computer trespasser if:
    - System owner consents
    - Part of a lawful investigation (AFOSI);
    - *Reasonable grounds* exist to believe the contents of trespasser's communications will be relevant to the investigation; and
    - Interception is limited only to those communications "to and from the trespasser"
  - A trespasser does not include a lawful user of the system who exceeds their authorized access, i.e., "insider threat"
- AFOSI/JA will provide legal advice and staff to AFOSI/CC

Final Thoughts

- Fourth Amendment violation where GPS was attached to a car without a warrant and Joneses' movements were tracked for 28 days. United States v Jones, 132 S. Ct. 945 (2012)
  - "More fundamentally, it may be necessary to reconsider the premise that an individual has no reasonable expectation of privacy in information voluntarily disclosed to third parties." J. Sotomayer, concurring.

Final Thoughts

- Search of a cell phone incident to arrest requires a warrant. Riley v. California, 134 S. Ct. 2473 (2014).
  - "Indeed, a cell phone search would typically expose to the government far *more* than the most exhaustive search of a house: A phone not only contains in digital form many sensitive records previously found in the home; it also contains a broad array of private information never found in a home in any form-unless the phone is." (emphasis in original)

Recap

- What is "cyber law"?
- Reasonable Expectation of Privacy
- Search and Seizure on the AFNET
- Stored Communications Act
- Pen Register / Trap Trace
- Wiretap Act
- Final Thoughts

Stored Communications Act

- Stored Communications Act (SCA), 18 U.S.C. §§ 2701-2712
  - Provides statutory and procedural protections to customer records and contents of communications when held in electronic storage
  - Electronic storage: "any temporary, intermediate storage of a wire or electronic communication incidental to the electronic transmission thereof"
- Applies to all electronic communications services, e.g., Yahoo, Google, and military networks

Topics

Status

- February 2016: DoD SIOO sends out 5240.01M for informal coord ✓
- February – March 2016: Working and DoJ adjudicate approximately 170 comments from informal coord ✓
- 7 March 2016: "Clean" 5240.01M sent to WHS for formatting ✓
- 11/14 March 2016: SIOO to send 5240.01M for formal coord ✓
- 1 April 2016: Suspense for formal coord ✓
- 15 April 2016: Complete adjudication of comments (DoD, DoJ) ✓
- April – May 2016: Legal/security/PCLOB reviews ✓
- July 2016: Anticipated signing by AG and SECDEF

Overview

- 5240.01M remains DoD implementing policy for E.O. 12333
- Follows same structure as 5240.1-R
  - Procedure 1 – General Provisions
  - Procedure 2 – Collection
  - Procedure 3 – Retention
  - Procedure 4 – Dissemination
  - Procedure 5 – Electronic Surveillance
  - Procedure 6 – Concealed Monitoring
  - Procedure 7 – Physical Search
  - Procedure 8 – Mail Searches and Cover
  - Procedure 9 – Physical Surveillance
  - Procedure 10 – Undisclosed Participation
- Procedures 11 – 15 removed from 5240.01M; AG approval not needed
  - To be published in other DoD issuance

Key Changes

- **New definition of collection**
  - Information is collected when it is received
  - Exception is when information not intelligible (e.g. encrypted)
  - Dissemination received from another agency is NOT collection
- **Concepts of shared repository and special collection added**
- **Counterintelligence exception expanded to account for HVE**
- **New retention timeframes for incidental collection**
  - Domestic incidental collection may be retained up to five years
  - Overseas incidental collection may be retained up to 25 years
  - DIC Heads and single delegee may approve extensions

Key Changes

- **Military magistrates may no longer authorize Procedure 7**
  - Only MCIOs may conduct searches against AD personnel
  - Must obtain FISA
- **Three approval levels for UDP**
  - No specific approval
  - DIC Head or delegee(s)
  - DIC Head or single delegee
- **Definitions of organization in US and outside US expanded to account for internet activity**
- **List of Defense Intelligence Components and their heads updated**

MAJOR CHANGES BY PROCEDURE

Procedure 1

General Provisions

Procedure 1 – General Provisions

- Para 3.1.b. – Adds concept of shared repositories
  - Para 3.1.b.2. – Procedures for components hosting shared repositories
  - Para 3.1.b.3. – Procedures for components acting as participants in shared repositories
- Paras 3.1.c. – 3.1.e. – DoD Senior Intelligence Oversight Official (SIOO) added as cognizant entity for interpretation, exceptions, amendments to 5240.01M

Procedure 2

Collection of US Person Information

Procedure 2 – Collections

- Para 3.2.c.4.c. – Counterintelligence: exception expands foreign terrorist connection to include individuals "*reasonably believed to be acting for or in furtherance of, the goals or objectives of an international terrorist or international terrorist organization, for purposes harmful to the national security of the United States.*"
  - Permits collection when no specific connection to foreign terrorist(s) has been established – HVE (e.g. San Bernardino, Orlando)

- Para 3.2.c.5.b. – Threats to Safety: Allows DIC heads or delegee to authorize collection when they have determined a "*persons' life or physical safety is reasonably believed to be in imminent danger;*"

Procedure 2 – Collections

- Para 3.2.c.8. – Persons in Contact With Sources or Potential Sources: New exemption category added.

- Para 3.2.c.10. – Physical Security: This exemption now includes a requirement that there exist a "*reasonable belief in…the foreign connection of the U.S. persons…and the physical security threat they pose.*"

- Para 3.2.c.12. – Overhead and Airborne Reconnaissance: This exemption now includes requirements to comply with DoD or NGA policies and procedures

- Former exemption for Narcotics has been removed (replaced by 3.2.c.8.)

Procedure 2 – Collections

- Para 3.2.e. – Adds notion of Special Circumstances Collection
  - "(C)*ollection opportunities raise special circumstances based on the volume, proportion, and sensitivity of the USPI likely to be acquired, and the intrusiveness of the methods used to collect the information.*"
  - DIC head or delegee must approve such collection and report approval to DoD SIOO
- Para 3.2.f.3. – Requires that in any collection of non-publicly available information the DICs must "*to the extent practicable, take steps to collect no more information that is reasonably necessary.*"

Procedure 3

Retention of US Person Information

Procedure 3 – Retention

- Para 3.3.c.1. – Intentional Collection of USPI: DIC must evaluate information promptly, but may retain for up to five years for evaluation
    - DIC Head or single delegee may approve an extended period
- Para 3.3.c.2.a. – Information collected incidentally in the US, or about a place in the US, may be retained for five years for evaluation
    - DIC Head or single delegee may approve an extended period
- Para 3.3.c.2.b. - Information collected incidentally outside the US, or about a place outside the US, may be retained for 25 years for evaluation
    - DIC Head or single delegee may approve an extended period

Procedure 3 – Retention

- Para 3.3.c.3. – Voluntarily Provided USPI: DIC may retain such information for up to five years for evaluation
    - DIC Head or single delegee may approve an extended period
    - If DIC receives voluntarily provided information about individual believed to be a non-US Person, but info may contain USPI, retention period is 25 years
- Para 3.3.c.4. – Special Circumstances: Such information may be retained for up to five years
    - USD(I) may approve an extended period
- Para 3.3.c.5. – Extended Retention

Procedure 3 – Retention

- Para 3.3.c.6. – Retention time frames do not begin until information has been processed into intelligible form (e.g. decryption)

- Para 3.3.d. – Information received from another component or IC element will be subject to the same, concurrent retention time limits as originating agency (i.e. clock does not restart for receiving entity)

- Para 3.3.e. – Addresses criteria for permanent retention

- Para 3.3.f.1.b. – Requires that "*when retrieving information electronically, tailor queries…to the greatest extent practicable to minimize the amount of USPI returned that is not pertinent…*"

- Para 3.3.f.1.c. – DICs must "*take reasonable steps to audit access to information systems containing USPI and to audit queries…to assess compliance with this issuance.*"

Procedure 3 – Retention

- Para 3.3.f.1.d. – When developing and implementing information systems for use with USPI, DICs must "*take reasonable steps to ensure effective auditing and reporting…*"
- Para 3.3.f.1.e. – When retaining information DICs are required to "*(e)stablish documented procedures for retaining data containing USPI and recording the reason…and the authority approving the retention.*"
- Para 3.3.f.1.f. – Requires annual training for employees accessing or using USPI
- Para 3.3.f.2. – DICs must employ reasonable measures to identify and mark files containing USPI
- Para 3.3.f.3. – DoD SIOO will periodically review DIC practices

Procedure 3 – Retention

- Para 3.3.g. – Enhanced Safeguards: DIC Head or delegee must assess need for enhanced safeguards when there is special circumstances collection
  - Factors to consider include
    - Intrusiveness of collection method(s)
    - Volume or sensitivity of USPI
    - Potential for harm, embarrassment, inconvenience, unfairness
    - Uses of USPI being retained
    - Length of retention
  - Para 3.3.g.2. – Details potential enhanced safeguard measures

Procedure 4

Dissemination of US Person Information

Procedure 4 – Dissemination

- Para 3.4.c. – Criteria for Dissemination: Several new categories added
  - Para 3.4.c.1. – Any Person or Entity: Dissemination to any person or entity permitted if information is publicly available or collected via consent
  - Para 3.4.c.8. – Protective Purposes: Dissemination permitted if necessary to protect safety/security of persons or property, or to protect against crime or threat to national security
- Para 3.4.d. – DICs may disseminate large amounts of unevaluated USPI (defined in Para 3.4.c.3.) with approval of DIC Head or single delegee, after notification to DoD SIOO

Procedure 4 – Dissemination

- Para 3.4.e. – DICs should not include USPI in dissemination "*if pertinent information can be conveyed in an understandable way without including the identifying information.*"
    - If dissemination includes USPI the receiving entity must be so notified
- Para 3.4.g. – Special considerations/controls on dissemination of information to the White House
- Para 3.4.h. – DICs must have procedures in place to address improper dissemination of USPI

Procedure 5

Electronic Surveillance

Procedure 5 – Electronic Surveillance

- Para 3.5.c.2. – Adds Attorney General (AG) to Foreign Intelligence Surveillance Court (FISC) as authorizing entities for electronic surveillance in the US
    - Paras 3.5.c.2.a. and 3.5.c.2.b. add criteria which DICs must meet in order to conduct such surveillance
- Para 3.5.c.3. – Add USD(I) as DoD entity authorized to request electronic surveillance of US Person in US
- Para 3.5.d.3. – Add USD(I) as DoD entity authorized to request electronic surveillance of US Person outside US
- Para 3.5.e. – Does NOT apply to MCIO CI activities against non-US Persons outside of the US

Procedure 5 – Electronic Surveillance

- Para 3.5.g. – In emergency situations, DICs may obtain approval from AG
    - Request for AG approval must be made by
        - SECDEF/DEPSECDEF
        - USD(I)
        - SECAF/USECAF (SECNAV/USECNAV, SECAR/USECAR)
        - DIRNSA
- Para 3.5.h. – In exigent circumstances, DICs may target US Persons outside of the US when AG approval is not practical if:
    - Person's life or physical safety in danger; or
    - Physical security of USG property in danger from foreign power; or
    - Time required for AG approval would result in harm to national security

Procedure 5 – Electronic Surveillance

- Para 3.5.h.2. – Approval of exigent circumstance electronic surveillance limited to :
  - SECDEF/DEPSECDEF
  - USD(I)
  - SECAF/USECAF (SECNAV/USECNAV, SECAR/USECAR)
  - DIRNSA/Deputy DIRNSA
  - NSA SIGINT Director
  - DIRNSA Senior Representative
  - Any flag/general office at overseas location in question w/responsibility for subject or endangered resources
- Para 3.5.i.2.b.1. – Adds allowance for collection of incidental information during TSCM when it is not reasonable to obtain consent of persons subject to incidental collection

Procedure 5 – Electronic Surveillance

- Para 3.5.i.2.c. – Adds criteria for retention and dissemination of information obtained during TSCM

- Para 3.5.i.3.c. – Adds several permissible targets of electronic surveillance for training purposes (sub-paras 3, 4, 5 and 6)

- Para 3.5.i.3.d. – Lists five conditions which must be met to train against targets other than those listed in 3.5.i.3.c.

    - Surveillance not targeted at particular person without consent
    - Not reasonable to obtain consent of persons incidentally subjected to surveillance
    - Not reasonable to train without engaging in such surveillance
    - Surveillance limited in extent and duration to that necessary
    - Minimal acquisition of information permitted for calibration

Procedure 6

Concealed Monitoring

Procedure 6 – Concealed Monitoring

- Para 3.6.a.2. – Procedure does not apply to concealed monitoring for testing or training when subjects consent; otherwise subject to Procedure 6

- Para 3.6.c.1. – DICs may conduct concealed monitoring outside DoD facilities in the US after coordination with FBI and in accordance with all DoJ/FBI agreements

- Para 3.6.c.3. – Concealed monitoring may be approved by DIC Head or a delegee

Procedure 7

Physical Searches

Procedure 7 – Physical Searches

- **NOTE: Searches based upon military magistrate authorization pursuant to Military Rules of Evidence are no longer permitted under Procedure 7**
  - Search authorizations may be used to pursue potential UCMJ violations under Military Rules of Evidence
- Para 3.7.c. – Searches Against Active Duty Military Personnel: only MCIOs may be authorized to conduct
  - Must be conducted under FISA with AG or FISC approval
  - SECDEF/DEPSECDEF, USD(I), SECAF/USECAF may seek approval
  - In emergency situations MCIO Head or delegee may make request to DoD GC to seek AG authorization

Page 110 of 3957

Procedure 7 – Physical Searches

- Para 3.7.d. – Searches Against Other Persons in the US: DICs may not conduct, but may request FBI to conduct if two conditions met

  1. Search must be for authorized FI or CI purpose

  2. Search must meet definition of physical search under FISA

  - SECDEF/DEPSECDEF, USD(I), SECAF/USECAF, DIRNSA, Director DIA, Director NGA, Director NRO may seek approval

  - In emergency situations MCIO Head may make request to DoD GC ask FBI to conduct search

Procedure 7 – Physical Searches

- Para 3.7.e. – Searches of Other US Persons or Their Property Outside the US: DICs may conduct such searches if three conditions met

  1. Search is for authorized FI or CI purpose; and

  2. Search is appropriately coordinated with CIA; and

  3. FISC or AG has approved search

  - SECDEF/DEPSECDEF, USD(I), SECAF/USECAF, DIRNSA, Director DIA, Director NGA, Director NRO may seek approval

  - In emergency situations MCIO Head may make request to DoD GC to seek AG authorization

Procedure 8

Searches of Mail and Mail Covers

Procedure 8 – Searches of Mail and Mail Covers

- Para 3.8.a. – Clarifies that this Procedure does not apply to items transported by a commercial carrier (e.g. Federal Express, UPS, etc.)

- Para 3.8.c.1. – Searches of Mail: subject to Procedure 7 limitations and approvals

- Para 3.8.d. – Mail covers: DICs may request USPS conduct mail cover for items in USPS channels

  - For mail in foreign channels DICs may request mail cover for items to/from US Person in accordance with local law and SOFA

  - No specific DIC official(s) identified as required to make request

Procedure 9

Physical Surveillance

Page 115 of 3957

Procedure 9 – Physical Surveillance

- Para 3.9.c.1.a. – DICs may conduct surveillance of US Persons in US if they fall into the existing 5240.1-R categories
- Para 3.9.c.1.b. – DICs may conduct surveillance of non-US Persons in US for authorized FI or CI purpose
- Para 3.9.c.1.c. – DIC Head or delegee must approve authorized physical surveillance
  - Physical surveillance in the US must be coordinated with FBI per existing agreements with DoJ/FBI
  - DICs can participate in physical surveillance of other US Persons in US when detailed to, or operating under the authorities of, the FBI

Procedure 9 – Physical Surveillance

- Para 3.9.c.1.d. – DIC Head or delegee may approve DIC participation in authorized FBI physical surveillance in US when FBI requests and authorizes DIC participation in writing

- Para 3.9.c.2.c. – DIC Head or a delegee may approve physical surveillance of any US person outside of the US

  - Physical surveillance outside the US conducted off of a military installation must be coordinated with the CIA

  - Approving official must consider host nation laws and SOFA

Procedure 10

Undisclosed Participation

Page 118 of 3957

Procedure 10 – Undisclosed Participation

- Para 3.10.a. – Clarifies that Procedure 10 applies to sources
- Para 3.10.b. – Identified three categories of excluded activities
  - Personal participation (i.e. undertaken for personal reasons and at personal expense)
  - Voluntarily provided information from existing members without request from DIC
  - Publicly available information on the internet collected in such a way that provision of personal identifying information is not required, and no communication with human being occurs

Procedure 10 – Undisclosed Participation

- Para 3.10.e. – Limitations on Undisclosed Participation: adds two additional limitations not found in 5240.1-R
  - UDP may not be authorized to collect on domestic activities of US persons
  - All UDP must be coordinated with FBI, CIA or other agency in accordance with EO 12333 and other policies/agreements
- Para 3.10.e.6.b. – DICs wishing to engage in UDP to influence activities of an organization per Para 3.10.e.6.a. must make request to USD(I) through DoD/GC
- Para 3.10.e.6.c. – Prohibition on influencing organizations does not apply to non-US Persons located outside the US

Procedure 10 – Undisclosed Participation

- Para 3.10.f. – Required Approvals: Approvals now authorized at three levels

1. No Specific Approval Required: Recognizes activity as UDP but no specific approval required
   - Education or training
   - Participation to maintain cover; no further activity in organization
   - Information published or posted by an organization open to the public when information is available to all members and no elicitation occurs (e.g. Subscription to Washington Post)
   - Public forums, to include social media, when employment affiliation is not required and no elicitation occurs (e.g. Facebook public profiles)
   - Foreign entities

Procedure 10 – Undisclosed Participation

2. UDP that may be approved by DIC Head or delegee

- Information collected to identify and assess non-US Person as potential source of assistance
- Public forums, to include social media, when employment affiliation is required and/or elicitation occurs (e.g. Facebook non-public profiles)
- Cover activities beyond obtaining or renewing membership
- Information collected outside the US from or about a non-US Person located outside the US

Procedure 10 – Undisclosed Participation

3. UDP that may be approved by DIC Head or ***single*** delegee

   - Collection of FI outside of US from or about a specific US Person, or from or about a non-US Person in the US
   - To conduct CI activities not addressed previously, in or outside the US
   - Collection of information inside the US needed to identify a US Person as potential source
   - Collection of information outside the US needed to assess a US Person as potential source

- Para 3.10.f.4. – UDP not addressed elsewhere in Procedure may be authorized by USD(I) or DIC Head with notice to DoD SIOO

Procedure 10 – Undisclosed Participation

- Para 3.10.f.5. – Approving official must make following determinations
  - "*Potential benefits to national security outweigh any adverse impact on civil liberties or privacy of US Persons.*"
  - UDP complies with requirements of Para 3.10.e.
  - UDP is least intrusive means feasible to obtain information and conforms to Procedure 2
- Para 3.10.g. – Disclosure requirement: Disclosure of DIC affiliation must be sufficient to apprise appropriate official(s) of the affiliation
  - If official to whom disclosure would be made acting on behalf of DIC, his/her knowledge not sufficient unless senior official of organization
  - DIC will maintain written record of disclosures, including to whom made

Definitions

Definitions

THE FOLLOWING DEFINITION HAVE BEEN ADDED OR NOTABLY CHANGED FROM 5240.1-R
(Definitions below are summarized)

- Agent of a Foreign Power – any person, including a US Person, acting for or on behalf of a foreign power
- Collection – information is collected ***when it is received by a DIC***
- Defense Intelligence Components – now defined as:
  - NSA/CSS
  - DIA
  - NRO
  - NGA
  - FI and CI elements of the Military Departments
  - Senior Intelligence Officials of the COCOMs

Definitions

- Defense Intelligence Component Head – now includes:
  - Director NSA
  - Director DIA
  - Director NRO
  - Director NGA
  - Deputy Chief of Staff, G2, Department of the Army
    - Commander, Army INSCOM
  - Director of Naval Intelligence
    - Director of Naval Intelligence Activity
    - Commander, ONI
  - Commander, US Fleet Cyber Command
  - Director, NCIS
  - Director of Intelligence, USMC
  - Commander, Marine Corps Intelligence Activity
  - Deputy Chief of Staff, ISR, Department of the Air Force
    - Commander, 25th Air Force
  - Commander, AFOSI

Page 127 of 3957

Definitions

- Detail – an employee of one agency operating under the authorities of another agency
- Dissemination – transmission of information outside of a DIC
- DoD Facility – Installations/facilities owned, leased or occupied by accommodation by DoD
- Foreign Connection – US Person in contact with a foreign person for purposes harmful to US national security
- Host of a Shared Repository – entity maintaining a shared repository
- Imagery – likeness of any feature and positional data thereof
- Incidental Collection of USPI – USPI collection not deliberately sought by a DIC but which is nonetheless collected
- Intelligence – includes FI and CI

Definitions

- Intentional Collection of USPI – USPI collection deliberately sought by a DIC
- Organization – expanded to include entities which meet and communicate principally through the use of technology
- Organization in the US – expanded to include organizations primarily meeting via the internet substantially composed of persons located in the US
- Organization Outside the US Constituting a US Person - organization physically located outside the US but substantially composed of US Persons or organization primarily meeting via the internet substantially composed of US Persons located outside the US
- Overhead Reconnaissance – activities of space-based capabilities conducting imagery collection

Definitions

- Physical Search – expanded to include electronic data
- Shared Repository– database or other repository maintained for the use of more than one agency
- Transmission Media Vulnerability Survey– acquisition of transmissions to determine vulnerability to interception
- Undisclosed Participation – participation in an organization without disclosure of DIC affiliation
- USPI – information reasonably likely to identify a specific US Person

Definitions

THE FOLLOWING DEFINITION HAVE BEEN REMOVED FROM 5240.01M

- Counterintelligence Investigation
- Lawful Investigation
- Physical Security

DoDM 5240.01, Overview

DoD MANUAL 5240.01

PROCEDURES GOVERNING THE CONDUCT OF DoD INTELLIGENCE ACTIVITIES

Originating Component:	Office of the Deputy Chief Management Officer of the Department of Defense
Effective:	Month Day, Year
Releasability:	Cleared for public release. Available on the DoD Issuances Website at http://www.dtic.mil/whs/directives
Incorporates and Cancels:	Directive-type Memorandum 08-031, "Intelligence Oversight Policy Guidance," March 20, 2008 Procedures 1-10 of DoD 5240.1-R, "Procedures Governing the Activities of DoD Intelligence Components That Affect United States Persons," December 7, 1982
Approved by:	Loretta E. Lynch, Attorney General of the United States Ashton B. Carter, Secretary of Defense

Purpose: In accordance with the authority in DoD Directive 5240.01 and Executive Order (E.O.) 12333, this issuance:

- Establishes procedures to enable DoD to conduct authorized intelligence activities in a manner that protects the constitutional and legal rights and the privacy and civil liberties of U.S. persons. DoD authorized intelligence activities are foreign intelligence and counterintelligence (CI) activities unless otherwise specified in this issuance.
- Authorizes the Defense Intelligence Components to collect, retain, and disseminate information concerning U.S. persons in compliance with applicable laws, Executive orders, policies, and regulations.

DoDM 5240.01, Overview

- Effective 8 Aug 2016; signed by SecDef and AG
- Changes are substantial, but not significant
- Replaces Procedures 1-10 of DoD 5240.1-R (Dec 1982)
- DoD 5240.01-R, Procedures 11-15, remain in effect
- No changes to Executive Order 12333

DoDM 5240.01, Overview

- CI Defined: Information gathered and activities conducted to *identify, deceive, exploit, disrupt,* or *protect* against espionage, other intelligence activities, sabotage, or assassinations conducted for or on behalf of foreign powers, organizations, or persons, or their agents, or international terrorist organizations or activities.

Procedure 2, Collection—Introduction

- **Intentional Collection of USPI: We may *intentionally* collect USPI *only* if:**
  - the information sought is ***reasonably believed;***
  - to be *necessary* for the performance of an authorized CI mission; and
  - the USPI falls within one of the following 13 categories below.
    - CI2MS *requires* that you indicate a Proc 2 collection category

- **U.S. Person Information (USPI) defined: Information that is reasonably likely to identify one or more specific U.S. persons.**

- **Collection takes place upon receipt**
  - Regardless of when you use it
  - Computers can collect
  - Intel is collected only once
  - May be disseminated multiple times
  - Encrypted data is considered collected upon receipt

Procedure 2, Collection—Reasonable Belief

- **Defined: When the facts and circumstances are such that a reasonable person would hold the belief.**
  - **Must rest on facts and circumstances that can be articulated;**
  - **Hunches or intuitions are not sufficient; and**
  - **Can be based on experience, training, and knowledge of CI activities as applied to particular facts and circumstances.**

Procedure 2, Collection—Categories

1. Publicly Available
2. Consent
3. Foreign Intelligence (FI)
4. Counterintelligence (CI)
5. Threats to Safety
6. Protection of Sources/Methods
7. Current, Former, or Potential Sources
8. Persons in Contact With Sources or Potential Sources
9. Personnel Security
10. Physical Security
11. Communications Security
12. Overhead and Airborne Reconnaissance
13. Administrative Purposes

Procedure 2, Collection Categories

1. **Publicly Available Information**

2. **Consent**
   - **The legal advisor must determine whether a notice or policy is adequate and lawful, before the Component takes or refrains from taking action on the basis of implied consent (DoDM 5240.01, G.2.)**

3. **Foreign Intelligence**
   - **AFOSI does not have a foreign intelligence mission**

Procedure 2, Collection—Categories

4. Counterintelligence: The information is reasonably believed to constitute CI and the U.S. person is one of the following:

- **(a) An individual, organization, or group reasonably believed to be engaged in or preparing to engage in espionage, other intelligence activities, sabotage, or assassination on behalf of a *foreign* power, organization, or person, or on behalf of an agent of a *foreign* power, organization, or person;**
- **(b) An individual, organization, or group reasonably believed to be engaged in or preparing to engage in international terrorist activities;**
- **(c) An individual, organization, or group reasonably believed to be acting for, or in furtherance of, the goals or objectives of an international terrorist or international terrorist organization, for purposes harmful to the national security of the United States; or**
- **(d) An individual, organization, or group *in contact with a person described above* for the purpose of identifying such individual, organization, or group and assessing any relationship with the person described therein.**

Procedure 2, Collection—Categories

5. Threats to safety: information needed to protect the safety of any person or organization, including those who are targets, victims, or hostages of international terrorist organizations, if:

- **The threat has a foreign connection;**
- **AFOSI/CC or delegee has determined that a person's life or physical safety is reasonably believed to be in imminent danger; *or***
- **The information is needed to maintain maritime or aeronautical safety of navigation.**

Procedure 2, Collection—Categories

6. **Protection of Intelligence Sources, Methods, and Activities**
   - The information is about U.S. persons who have access to, had access to, will have access to, or are otherwise in possession of information that reveals foreign intelligence or CI sources, methods, or activities, when collection is **reasonably believed** necessary to protect against the unauthorized disclosure of such information.

7. **Current, Former, or Potential Sources of Assistance**
   - The information is about those who are or have been sources of information or assistance, or are **reasonably believed** to be potential sources of information or assistance, to intelligence activities for the purpose of assessing their suitability or credibility.

8. **Persons in Contact With Sources or Potential Sources**
   - The information is about persons in contact with sources or potential sources, for the purpose of assessing the suitability or credibility of such sources or potential sources.

9. **Personnel Security**
   - The information is arising from a lawful personnel security investigation.

Procedure 2, Collection—Categories

10. Physical Security

- The information is about U.S. persons **reasonably believed** to have a *foreign* connection and who pose a threat to the physical security of DoD personnel, installations, operations, or visitors.
- Must have or be supporting an authorized physical security mission and must be able to articulate a **reasonable belief** in both the foreign connection of the U.S. persons who are collection targets and the physical security threat they pose.

11. Communications Security Investigation

- The information is arising from a lawful communications security investigation.

Procedure 2, Collection—Categories

12. Overhead and Airborne Reconnaissance

- May intentionally collect imagery that contains USPI provided that the collection is ***not*** directed at a specific U.S. person or, if the collection is directed at a specific U.S. person, the collection falls in one of the other 12 categories
- Includes information obtained from unmanned aircraft systems
- See SecDef Memo Feb 2016

13. Administrative Purposes

Procedure 2, Collection—Other Considerations

- **Least Intrusive Means**
  - Use the least intrusive collection techniques feasible within the United States *or* directed against a U.S. person abroad.
    1. Publicly available sources or with consent
    2. Cooperating sources
    3. Techniques that do *not* require a judicial warrant or AG approval
    4. Techniques that do require a judicial warrant or AG approval
- **Amount of Information Collected**
  - In collecting non-publicly available USPI, to the extent practicable, collect no more information than is reasonably necessary.
- **Special Circumstances Collection [BIG data]**
  - Components will consider whether collection opportunities raise special circumstances based on the *volume*, *proportion*, and *sensitivity* of the USPI likely to be acquired, and the intrusiveness of the methods used to collect the information.

Procedure 3, Retention

- **Permanent Retention standard**
  - Retention is **reasonably believed** to be necessary for the performance of an authorized intelligence mission; *and*
  - The information was lawfully collected or disseminated to the Component:
    - Meets one of the 13 Proc 2 collection categories; or
    - Is necessary to understand or assess CI, e.g., information about a U.S. person that provides important background or context for CI.

Procedure 3, Retention

- Three primary evaluation periods to determine permanent retention of USPI
  - Promptly
  - Five (5) years
  - Twenty-five (25) years

- Intentional Collection of USPI
  - Must be evaluated promptly; and
  - If *necessary*, may retain the information for evaluation for up to 5 years, subject to extension

Procedure 3, Retention

- **Incidental Collection of USPI**
  - Defined: collection of USPI that is not deliberately sought, but is nonetheless collected
  - *In the United States,* may retain all of the incidentally collected information for evaluation for up to **5 years**, unless extended
  - *Outside the United States, may* retain all of the incidentally collected information for evaluation for up to **25 years**

- **Voluntarily Provided USPI**
  - About a U.S. person, evaluate the information **promptly**, up to **5 years**, unless extended
  - About a non-U.S. person, evaluation for up to **25 years**

Procedure 3, Retention

- **Unintelligible information**
  - Includes information that a Component cannot decrypt or understand in the original format
  - The time periods begin when the information is processed into intelligible form
  - To the extent practicable, unintelligible information will be processed into an intelligible form
  - A foreign language is considered intelligible

- **Deletion of Information**
  - Unless the standards for permanent retention are met, must delete all USPI from the Component's automated systems of records

Procedure 4, Dissemination

- We may disseminate USPI based upon the following criteria:
  - Any person or entity: Information is publicly available or U.S. person has consented to the dissemination
  - Other intelligence community elements
  - Other DoD elements; federal government entities; state, local, tribal, or territorial governments: recipient is **reasonably believed** to have a need to receive such information for the performance of its lawful missions or functions.
  - Foreign governments or international organizations
    - Recipient is **reasonably believed** to have a need to receive such information for its lawful missions or functions; and
    - Disclosure is consistent with applicable international agreements and foreign disclosure policy
  - Protective Purposes
    - Necessary to protect the safety or security of persons or property, or to protect against or prevent a crime or threat to the national security

Procedure 5, Electronic Surveillance

- Implements FISA and E.O. 12333
- Defined for U.S. collection
  - The installation or use of any monitoring device in the United States where a person has a reasonable expectation of privacy, as determined by JA, and
  - A warrant would be required for law enforcement purposes
- Fourth Amendment
  - All electronic surveillance must comply with the Fourth Amendment
  - JA must assess the reasonableness of collection, retention, and dissemination (DoDM 5240.01, para. 3.5.b.)

Procedure 5, Electronic Surveillance

- **In the United States**
  - **Attorney General or the Foreign Intelligence Surveillance Court (FISC) must authorize, except in emergency situations.**
  - **May only conduct such surveillance if both:**
    - **A *significant purpose* of the electronic surveillance is to obtain foreign intelligence information; and**
    - **There is probable cause to believe that the target of the electronic surveillance is a foreign power or an agent of a foreign power.**

Procedure 5, Electronic Surveillance

- Outside the United States
  - U.S. person
    - Governed by FISA and E.O. 12333; or
    - Approval under exigent circumstances exception
  - Non-U.S. person: governed by Title I or Section 702
- Emergency situations: Attorney General approval
- Technical Surveillance Countermeasures (TSCM)
  - Applies to the use of electronic equipment and specialized techniques to determine the existence and capability of electronic surveillance equipment being used by persons not authorized to conduct electronic surveillance.

Procedure 6, Concealed Monitoring

- **Defined as the following:**
  - Hidden electronic, optical, or mechanical devices,
  - to monitor a particular person or a group of persons,
  - without *consent*,
  - in a surreptitious manner,
  - over a period of time, and
  - no *reasonable expectation of privacy*
- **Examples**
  - Video monitoring or sound recording of a subject in a place where he or she has no reasonable expectation of privacy if conducted over a period of time
  - Taking one photograph of a subject would *not* qualify

Procedure 6, Concealed Monitoring

- Scope
  - *Any* person inside the United States, or
  - Any U.S. person outside the United States
- Procedures
  - In the United States
    - On DoD facilities
    - Outside DoD facilities, after coordination with the FBI
  - Outside the United States
    - On DoD facilities
    - Outside DoD facilities must be coordinated with the CIA, and appropriate host country officials in accordance with any applicable SOFA or other international agreement.

Procedure 6, Concealed Monitoring

- **Approval: AFOSI/CC or delegee (*new*)**

- **The following criteria must be met:**
  - **There is no reasonable expectation of privacy;**
  - **Such monitoring is necessary to conduct an assigned CI function;**
  - **A trespass will not be necessary to effect the monitoring; and**
  - **The monitoring is not subject to Procedure 5 (DoDM 5240.01, 3.6.c.(3))**

Procedure 7, Physical Searches

- Scope: Applies to *nonconsensual* physical searches in the United States ***and*** of U.S. persons/property outside the United States.
- Defined: Any intrusion on a person or property that would require a *warrant* for law enforcement purposes.
- Does ***not*** include examinations of
  - Areas that are in plain view;
  - Publicly available information;
  - Abandoned property in a public place;
  - Items where we have consent; and
  - Government property pursuant to Military Rule of Evidence 314(d)

Procedure 7, Physical Searches

- **Active duty**
  - Approval: Attorney General (AG) or FISC (*new*)
- **Other persons inside the United States**
  - We may ***NOT*** conduct searches of other persons
  - We may request the FBI to conduct such a search
- **Other U.S. persons outside the United States**
  - The search is for an authorized foreign intelligence or CI purpose;
  - The search is appropriately coordinated with the CIA; and
  - The FISC or the AG has authorized the search
  - Who can request
    - SecDef, DSD, USD(I); SecAF; USecAF; DIRNSA/CHCSS; Director, DIA; Director, NGA; or Director, NRO

Procedure 8, Mail Searches and Cover

- **Mail searches**
  - See Procedure 7
- **Mail cover**
  - In U.S. postal service channels, request the USPS IAW 39 CFR 233.3(e)(2)
  - In foreign postal channels, may request a mail cover for mail that is to or from a U.S. person consistent foreign law and any applicable SOFA

Procedure 9, Physical Surveillance

- **Who can we surveil *in* the United States:**
  - Military service members;
  - Present or former military or civilian employees of a DIC;
  - Present or former contractors of a DIC;
  - Present or former employees of such a contractor;
  - Applicants for such employment or contracting;
  - Non-U.S. persons (*new*); and
  - Other persons
    - "when **detailed** to the FBI, or
    - when operating **under FBI authorities**."
- ***Outside*** **of the United States**
  - "Any U.S. person . . . for an authorized foreign intelligence or CI purpose" (DoDM 5240.01, para. 3.9.c.(2)(a))

Procedure 9, Physical Surveillance

- **Scope**
  - Any person inside the United States or any U.S. person outside the United States.
  - Also applies to any devices used to observe the subject of the surveillance (not Procedure 6).

- **Defined**
  - Deliberate and continuous observation of a person, and
  - Where the person has no reasonable expectation of privacy
  - Does ***not*** apply to surveillance detection or counter surveillance used to detect and elude foreign physical surveillance

Procedure 9, Physical Surveillance

- **Approval and coordination**
  - **Approval: AFOSI/CC or delegee**
  - **Coordination**
    - **In the United States**
      - No coordination req'd for surveillance of active duty, on-base
      - FBI coord for off-base surveillance
      - FBI coord for surveillance on-base, non-active duty
    - **Outside the United States**
      - CIA coord for off-base surveillance
      - Consider with SOFA and foreign law/policy

Procedure 10, Undisclosed Participation (UDP)

- Scope: Governs the ***participation*** by an defense IC and anyone acting on behalf of an IC, e.g., sources, in any ***organization*** in the United States or any organization outside the United States that constitutes a U.S. person.
- Organization defined
  - An association of two or more individuals formed for any *lawful* purpose whose existence is formalized in some manner
  - Includes those that meet and communicate through the use of technologies
- Participation defined
  - When a person is tasked or asked to participate in an organization for the benefit of the DIC
  - Actions undertaken "for the benefit of" a DIC may include collecting information, identifying potential sources or contacts, or establishing or maintaining cover.

Procedure 10, Undisclosed Participation (UDP)

- **Exclusions**
  - Personal participation
  - Voluntarily provided information
  - Publicly available information on the Internet
    - Collection of publicly available information on the Internet in a way that does *not* require a person to provide identifying information (such as an email address) as a condition of access and does not involve communication with a human being
- **Approval level depends on the activity**
  - No specific level of approval
  - AFOSI/CC or delegee
  - AFOSI/CC or single delegee

Procedure 10, Undisclosed Participation (UDP)

- **Standards for review and approval:**
  - **The potential benefits to national security outweigh any adverse impact on civil liberties or privacy of U.S. persons;**
  - **The proposed UDP complies with the limitations on UDP; and**
  - **The proposed UDP is the least intrusive means feasible and conforms to the requirements of Procedure 2.**

Procedure 10, Undisclosed Participation (UDP)

- UDP requiring no specific level of approval
  - Education or training
  - Cover Activities: Participation in an organization solely for the purpose of obtaining or renewing membership status *in accordance with DoD cover policy*
  - Published or posted information: Participation in an organization whose membership is open to the public solely for the purpose of obtaining information published or posted by the organization or its members and generally available to members; must not involve elicitation.
  - Public forums: Employment affiliation not required and no elicitation of USPI; and
  - Foreign entity

Procedure 10, Undisclosed Participation (UDP)

- **UDP That May Be Approved by a Component Head or Delegee**
  - Non-U.S. persons as potential sources of assistance
  - Public forums: employment affiliation required or elicitation of USPI may be authorized
  - Cover activities beyond obtaining or renewing membership for the purpose of maintaining or enhancing cover
  - U.S. person organizations outside the United States involving participation from or about a non-U.S. person located outside the United States.

Procedure 10, Undisclosed Participation (UDP)

- **UDP That May Be Approved by a Component Head or a *Single* Delegee**
  - To conduct authorized CI activities not otherwise addressed in or outside the United States, after required coordination with the FBI or CIA.
  - To collect information inside the United States necessary to identify a U.S. person as a potential source of assistance to foreign intelligence or CI activities.
  - To collect information outside the United States necessary to assess a U.S. person as a potential source of assistance to foreign intelligence or CI activities.

HQ AFOSI/XIL FORM O-3, 19970701 (Word)

Scenario

- You are stationed in Los Angeles, CA and tasked to surveil a military member suspected of providing classified information to a foreign power. You observe the member meeting with a known Chinese IO, driving a black Jeep Wrangler. While observing the meet you see a second individual, an unknown white male, with closely shaven hair approach the vehicle. In your reporting of the event can you:
  - Identify the primary subject?
  - Identify the Jeep Wrangler?
  - Describe the second individual?
  - What is the assumption of citizenship on the second individual?

Scenario

- You are grabbing a pint at Murphy's pub. You run into an old co-worker who is now an FBI agent. He states he heard you are working on a big Ukrainian FIS case. He wants to know if you can share information with him.

- Can you??

Agenda

- Significance of Executive Order 12333
  - Key Sections
  - History
  - Today
- Counterintelligence v. Law Enforcement
  - Definition
  - Assigned Missions (E.O. 12333)
- CI Jurisdiction and UCMJ
  - Personal and Subject Matter
  - Article 31(b)

Other relevant provisions of EO 12333

- E.O. 1.4—Role of the IC
  - Collect and provide information needed by the President
  - Collect information on int'l terrorism, proliferation of WMD
  - Analyze, produce, and disseminate intelligence
  - Conduct research, development, and procurement of technical systems and devices for the IC
  - Protect the security of intel related activities, information, installations, property, and employees
- E.O. 1.10—Roles of the DoD
  - The Secretary of Defense shall "collect (including through clandestine means), analyze, produce, and disseminate information and intelligence in response to tasking by the DNI and to execute SecDef's responsibilities

Our Mission per the President, E.O. 12333

- **E.O. 12333, 1.7(f) Intelligence Community Elements: ARMY, NAVY, AIR FORCE, AND USMC.**

- **The Commanders and heads of the intelligence and counterintelligence elements *shall*:**

  (1) Collect (including through clandestine means), produce, analyze and disseminate defense and defense-related intelligence and counterintelligence to support departmental requirements, and, as appropriate, national requirements;

  (2) Conduct counterintelligence activities;

  (3) Monitor the development, procurement, and management of tactical intelligence systems and equipment and conduct related research, development, and test and evaluation activities; and

  (4) Conduct military intelligence liaison relationships and military intelligence exchange programs with selected cooperative foreign defense establishments and international organizations

Counterintelligence Defined

Counterintelligence **means information gathered and activities conducted to identify, deceive, exploit, disrupt, or protect against espionage, other intelligence activities, sabotage, or assassinations conducted for or on behalf of *foreign powers*, organizations, or persons, or their agents, or *international terrorist organizations* or activities.**

-- EO 12333, 3.5(a)

What does the threat look like?

(b)(6),(b)(7)(C)

(b)(6),(b)(7)(C)

Page 183 of 3957

What are we up against?

Counterterrorism Defined

Counterterrorism is the activities and operations taken to neutralize terrorists and their organizations and networks in order to render them incapable of using violence to instill fear and coerce governments or societies to achieve their goals

-- Joint Publication 3-26 "Counterterrorism," 24 Oct 2014

- FBI is lead for all CT cases in the US

A Very Brief History . . .

- Spying is one of the oldest professions
  - General George Washington noted during the War of Independence "it was the British spies he feared the most."

- Today's laws and policies are the direct result of unfettered intelligence collection by DoD, FBI and CIA in the 1960s and 1970s.
  - Physical surveillance of public figures involved with the anti-Vietnam war and civil rights protests, e.g., MLK
  - Mail openings
  - Break-ins of the offices, vehicles and houses of U.S. persons
  - Undisclosed participation on university campuses

Unfettered Intelligence Collection

In September 1963, Attorney General Robert Kennedy gave permission to the FBI to break into Dr. Martin Luther King's home and install listening Devices.

The result?

- The Church and Pike congressional committees found the IC lacked policy on how to conduct it's mission in regards to U.S. persons
  - Recommended "reining" in Executive Branch powers in using intelligence elements against U.S. persons
  - Created the Permanent Select Committee on Intelligence (Senate) and the Congressional Committee on Intelligence
  - The Foreign Intelligence Surveillance Act was enacted in 1978

- Before Congress passed legislation to correct this deficiency, E.O. 11905 was signed, which was later replaced by E.O. 12333 (standing E.O. on Intelligence Oversight)

Current Concerns

- Continued desire of the U.S. government to ensure Intelligence Community personnel do not engage in activities which are illegal or that violate the rights of U.S. or other persons
  - Patriot Act renewal (renamed USA Freedom Act)
    - "The legislation we're considering proposes major changes to some of our nation's most fundamental and necessary counter-terrorism tools." Senate Majority Leader Mitch McConnell, R-Kent
  - DoDM 5240.01, 18 August 2016 -- NEW

- Areas of concern for the intelligence community:
  - Bulk data collection and databases
  - Insider Threat
    - Security Screening / Network Monitoring / Cyber activities
    - Mission Creep
  - Use of UAVs
  - The Internet
  - Others?

CI and LE Authorities

CI	LE
US Constitution Executive Order 12333 DoDM 5240.01 (Procs 1-10) DoD 5240.1-R (Procs 11-15) FISA (50 U.S.C. § § 1801 et seq) (National Security/Bank Letters) - 18 U.S.C. § 2709 (FBI only) - 15 U.S.C. § 1681v (DoD) - 12 U.S.C. § 3414 (FBI/DoD) - 50 U.S.C. § 3162 (FBI/DoD-travel records also available)	US Constitution DoDD 5200.27 - (U.S. Person) DoDI O-5505.09 - (Intercept Program) 18 U.S.C. § § 2701-2711 (ECPA-Electronic Communications Privacy Act) 18 U.S.C. § § 3121-27 (Pen/Trap Statute) 18 U.S.C. § § 2510-2522 (Wiretap Statute)

CI and Criminal Investigations

- Sister Services are inherently different (due to make-up and missions)
  - Army CI: Conducted solely by Intel professionals (No LE authority)
  - Navy CI: Conducted solely by NCIS Agents (dual CI/LE authorities)
  - AF CI: Conducted solely by AFOSI Agents (dual CI/LE authorities)
- USD(I) Policy controls CI investigations to include use of physical surveillance and other specialized collection techniques

Practice Points

- A CI investigation may transition to more LE methodology and techniques once charges are identified

- The approval authorities for some specialized collection techniques are lower for LE cases (physical surveillance and mail covers) and vice versa (oral wire intercepts)

Who can we investigate?

DoD CI Investigative Jurisdiction (of the Person)

CONUS

- Active Duty Military
- Retired Military, Active or Inactive Reserve, Member of National Guard if suspected offense occurred when subject was in Title 10 status

OCONUS

- AD and DoD civilians and dependents
- DoD contractors or family members (Coor'd with CIA/FBI)
- Retired personnel and other foreign nationals (Coor'd with FBI/CIA)

What can we investigate?

DoD CI Investigative Jurisdiction (subject matter)

- CI Investigative Jurisdiction (Subject Matter)
- Espionage, Treason, Spying, Subversion, Sedition
- FIS directed sabotage
- CI aspects of terrorism
- CI aspects of assassination or incapacitation of personnel
- Suicide/ AWOL of personnel with access/ clearance
- CI aspects of polygraph exams/ refusals
- CI aspects of unofficial travel or foreign contacts
- CI aspects of Insider Threat

Article 31(b), UCMJ

- Article 31(b) advice sounds a lot like Miranda except the military suspect is told what crime(s) they are suspected of committing.
- Also, military members receive the warnings, not only when they're in custody, but anytime they're officially questioned by someone who believes they have committed a criminal offense.
- Article 31(b) advice is an attempt to dispel the inherent compulsion a service member might feel to answer questions during interrogations by military superiors.

Taking a Moment....

Page 196 of 3957

Agenda, Part 2

- E.O. 12333
- DoDM 5240.01
  - Definitions (USPI, collection, retention and dissemination)
  - Procedure 2
  - Procedure 3
  - Procedure 4
  - Scenarios

Part II of EO 12333

"[T]o provide for the effective conduct of intelligence activities and the protection of constitutional rights...." -- EO 12333, Preamble

EO 12333, section 2.3

- Elements of the Intelligence Community are authorized to collect, retain, or disseminate information concerning United States persons only in accordance with procedures established by the head of the Intelligence Community element concerned or by the head of a department containing such element and *approved by the Attorney General*, consistent with the authorities provided by Part 1 of this Order, after consultation with the Director.

Who is a US Person?

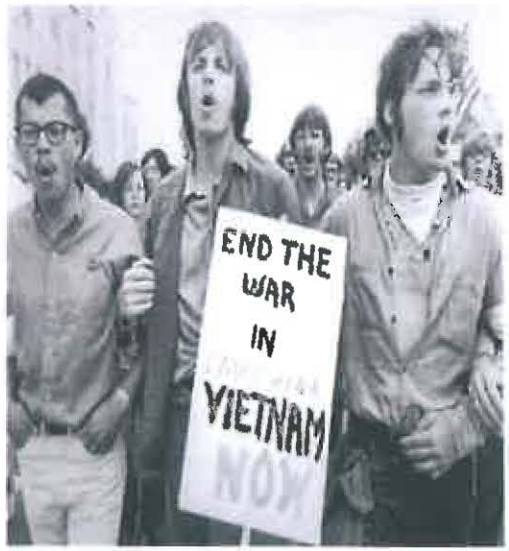
- US citizen
- Lawful permanent resident alien
- Unincorporated association substantially composed of US citizens or permanent resident aliens
- Corporation incorporated in the US, except for a corporation directed and controlled by a foreign government
- **NOTE:** A person or organization outside the US shall be presumed not to be a USP *unless specific information* to the contrary is obtained
- **Foreign national married to a U.S. servicemember?**

What is U.S. Person Information (USPI)?

- Information that is reasonably likely to identify one or more specific U.S. persons.
- May require a case-by-case assessment by a trained intelligence professional.
- May include names or unique titles; government-associated personal or corporate identification numbers; unique biometric records; financial information; and street address, telephone number, and Internet Protocol address info.
- Does not include:
  - A reference to a product by brand or manufacturer's name in a descriptive sense, e.g., Boeing 737

Basic Principles

- The rules permit CI investigations & operations targeting US persons, but must follow specific procedures
  - Do not infringe the constitutional rights of US persons
  - Protect privacy rights of persons entitled to protection
    - Rights to which a person is entitled depends on status and location
  - Perform a lawfully assigned function
  - Employ least intrusive techniques
    - If conducted in the US or directed against a US person
  - Comply with regulatory requirements
    - Review and approval requirements



Okay, but how can we do it?

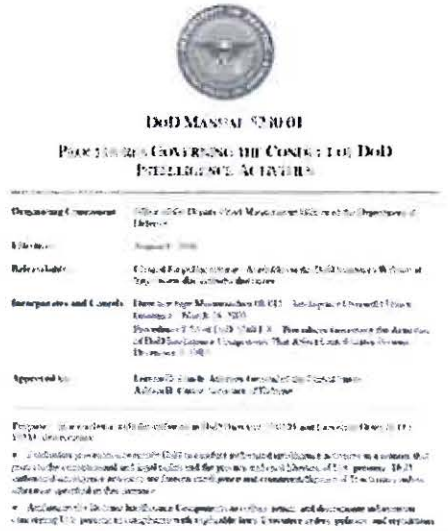
- DoDM 5240.01 and DoD 5240.1-R apply to activities of DoD Intelligence Components

  DoDM 5240.01 (8 Aug 2016)

  - Procedures 2 - 4: Authority to collect, retain, and disseminate United States person information (USPI)
  - Procedures 5 - 10: Guidance for *specialized* techniques to collect foreign intelligence and counterintelligence

  DoD 5240.01-R (7 Dec 1982)

  - Procedures 11 - 15 govern other aspects of DoD intel activities, including the oversight of such activities.



DoD MANUAL 5240.01

PROCEDURES GOVERNING THE CONDUCT OF DoD INTELLIGENCE ACTIVITIES

Procedure 2, Collection of USPERS Info

- Rule 1: You may intentionally collect USPI only if the information sought is *reasonably believed* to be *necessary* for the performance of an authorized intelligence mission or function, and if the USPI falls within one of the 13 categories

- Collection = Information is collected when it is *received* whether or not it is retained for intelligence or other purposes.
  - Regardless of when you use it
  - Computers can collect
  - Intel is collected only once

- Must use LEAST INTRUSIVE MEANS as are practicable when collecting USPI

Procedure 2, Reasonable Belief

- When the facts and circumstances are such that a reasonable person would hold the belief.
- Must rest on facts and circumstances that can be articulated
- Hunches or intuitions are not sufficient.
- Can be based on experience, training, and knowledge of foreign intelligence or CI activities as applied to particular facts and circumstances.

Procedure 2, 13 Collection Categories

1. Publicly Available
2. Consent
3. Foreign Intelligence (FI)
4. Counterintelligence (CI)
5. Threats to Safety
6. Protection of Sources/Methods
7. Current, Former, or Potential Sources
8. Persons in Contact With Sources or Potential Sources
9. Personnel Security
10. Physical Security
11. Communications Security
12. Overhead and Airborne Reconnaissance
13. Administrative Purposes

Procedure 2, 13 Collection Categories

1. **Publicly Available**
   - Not the same as OSINT

2. **Consent**
   - Implied consent: The legal advisor will determine whether a notice or policy is adequate and lawful, before the Component takes or refrains from taking action on the basis of implied consent.

3. **Foreign Intelligence**
   - (a) An individual reasonably believed to be an officer or employee of, or otherwise acting on behalf of, a foreign power;
   - (b) An organization or group reasonably believed to be directly or indirectly owned or controlled by, or acting on behalf of, a foreign power;
   - (c) An individual, organization, or group reasonably believed to be engaged in or preparing to engage in international terrorist or international narcotics activities;
   - (d) An individual, organization, or group who is a target, hostage, or victim of an international terrorist or international narcotics organization.

Procedure 2, 13 Collection Categories

4. Counterintelligence

- The information is *reasonably believed* to constitute CI and the U.S. person is one of the following:

(a) An individual, organization, or group reasonably believed to be engaged in or preparing to engage in espionage, other intelligence activities, sabotage, or assassination on behalf of a *foreign* power, organization, or person, or on behalf of an agent of a *foreign* power, organization, or person;

(b) An individual, organization, or group reasonably believed to be engaged in or preparing to engage in international terrorist activities;

(c) An individual, organization, or group reasonably believed to be acting for, or in furtherance of, the goals or objectives of an international terrorist or international terrorist organization, for purposes harmful to the national security of the United States; or

(d) An individual, organization, or group *in contact with a person described above* for the purpose of identifying such individual, organization, or group and assessing any relationship with the person described therein.

Procedure 2, 13 Collection Categories

5. Threats to Safety

- Information needed to protect the safety of any person or organization, including those who are targets, victims, or hostages of international terrorist organizations, if:
  - (a) The threat has a *foreign* connection;
  - (b) Component head or delegee has determined that a person's life or physical safety is *reasonably believed* to be in imminent danger; *or*
  - (c) The information is needed to maintain maritime or aeronautical safety of navigation.

6. Protection of Intelligence Sources, Methods, and Activities

- The information is about U.S. persons who have access to, had access to, will have access to, or are otherwise in possession of information that reveals foreign intelligence or CI sources, methods, or activities, when collection is reasonably believed necessary to protect against the unauthorized disclosure of such information.

Procedure 2, 13 Collection Categories

7. Current, Former, or Potential Sources of Assistance

- The information is about those who are or have been sources of information or assistance, or are reasonably believed to be potential sources of information or assistance, to intelligence activities for the purpose of assessing their suitability or credibility.

8. Persons in Contact with Sources or Potential Sources

- The information is about persons in contact with sources or potential sources, for the purpose of assessing the suitability or credibility of such sources or potential sources.

9. Personnel Security

- The information is arising from a lawful personnel security investigation.

10. Physical Security

- The information is about U.S. persons reasonably believed to have a *foreign* connection and who pose a threat to the physical security of DoD personnel, installations, operations, or visitors
- Must have or be supporting an authorized physical security mission and must be able to articulate a reasonable belief in both the foreign connection of the U.S. persons who are collection targets and the physical security threat they pose

Procedure 2, 13 Collection Categories

11. Communications Security Investigation

- The information is arising from a lawful communications security investigation

12. Overhead and Airborne Reconnaissance

- May intentionally collect imagery that contains USPI provided that the collection is ***not*** directed at a specific U.S. person or, if the collection is directed at a specific U.S. person, the collection falls in one of the other 12 categories
- Includes information obtained from unmanned aircraft systems

13. Administrative Purposes

Procedure 2, Least Intrusive Means

- **Least Intrusive Means**
  - Use the least intrusive collection techniques feasible within the United States or when directed against a U.S. person abroad.
    - Publicly available sources or with the consent of the person concerned
    - Cooperating sources
    - Techniques that do not require a judicial warrant or AG approval
    - Techniques that do require a judicial warrant or AG approval

Procedure 2, Other

- Special Circumstances Collection – BIG DATA
  - Defense Intelligence Components ***will*** consider whether collection opportunities raise special circumstances based on the volume, proportion, and sensitivity of the USPI likely to be acquired, and the intrusiveness of the methods used to collect the information

- Amount of Information Collected
  - In collecting non-publicly available USPI, to the extent ***practicable***, collect no more information than is reasonably necessary

Threshold Questions

- Are we collecting?
- Does the collection concern USPI?
- Does the collection fall within assigned mission/ function?
- Does the information collected fall within one of the 13 permissible categories?
- Are you using the least intrusive method?

- Consider the following collection "formula":

Mission + Reasonable Basis + Procedure = Collection

Procedure 3, Retention

- Permanent retention standard
  - Retention is reasonably believed to be necessary for the performance of an authorized intelligence mission; and
  - The information was lawfully collected or disseminated to the Component
    - Meets one of the 13 collection categories; or
    - Is necessary to understand or assess CI, e.g., information about a U.S. person that provides important background or context for CI.

Page 215 of 3957

Procedure 3, Retention

- Three primary evaluation periods to determine permanent retention of USPI
  - Promptly
  - Five (5) years
  - Twenty-five (25) years

- Intentional Collection of USPI
  - Must be evaluated promptly; and
  - If *necessary*, may retain the information for evaluation for up to 5 years, subject to extension

Page 216 of 3957

Procedure 3, Retention

- **Incidental Collection of USPI**
  - Defined: collection of USPI that is not deliberately sought, but is nonetheless collected
  - *Person in the United States,* may retain all of the incidentally collected information for evaluation for up to 5 years, unless extended
  - *Person outside the United States, may* retain all of the incidentally collected information for evaluation for up to 25 years

- **Voluntarily Provided USPI**
  - About a U.S. person, evaluate the information promptly, up to 5 years, unless extended.
  - About a non-U.S. person, evaluation for up to 25 years

Page 217 of 3957

Procedure 3, Retention

- **Unintelligible information**
  - The time periods begin when the information is processed into intelligible form
  - Includes information that a Component cannot decrypt or understand in the original format.
  - To the extent practicable, unintelligible information will be processed into an intelligible form.
  - Text in a foreign language is considered intelligible

- **Deletion of information**
  - Unless the standards for permanent retention are met, ***must*** delete all USPI from the Component's automated systems of records

Page 218 of 3957

Procedure 4, Dissemination

- We may disseminate USPI based upon the following criteria:
  - Any person or entity: Information is publicly available or U.S. person has consented to the dissemination.
  - Other intelligence community elements
  - Other DoD elements; federal government entities; state, local, tribal, or territorial governments: recipient is reasonably believed to have a need to receive such information for the performance of its lawful missions or functions.
  - Foreign governments or international organizations
    - Recipient is reasonably believed to have a need to receive such information for its lawful missions or functions; and
    - Disclosure is consistent with applicable international agreements and foreign disclosure policy
  - Protective Purposes: Necessary to protect the safety or security of persons or property, or to protect against or prevent a crime or threat to the national security

Page 219 of 3957

Questions on Procedures 2 – 4?

BREAK TIME

Page 220 of 3957

Agenda, Part 3

- Special Collection Procedures
  - Procedure 5 – Electronic Surveillance
  - Procedure 6 – Concealed Monitoring
  - Procedure 7 – Physical Search
  - Procedure 8 – Mail Covers
  - Procedure 9 – Physical Surveillance
  - Procedure 10 – Undisclosed Participation

Procedure 5, Electronic Surveillance

- Implements FISA and E.O. 12333
- Defined
  - The installation or use of any monitoring device in the United States where a person has a reasonable expectation of privacy, as determined by the legal advisor, and
  - A warrant would be required for law enforcement purposes.
- Fourth Amendment
  - All electronic surveillance must comply with the Fourth Amendment
  - The legal advisor is required to assess the reasonableness of collection, retention, and dissemination

Page 222 of 3957

Reasonable Expectation of Privacy

- Reasonable expectation of privacy (REP)
  - Can a person have a REP in a government office?
  - REP if a person has a private office with locked door?
  - Does a person in a public street ordinarily have a REP?
  - A person in their vehicle on public roads? A private garage?
- Generally, no expectation of privacy in . . .
  - Bank records (NSL)
  - Public activities
  - Garbage left at the curb, abandoned property
  - Handwriting
  - Smell of luggage
- Legal advisor needs the facts from the field re: REP

Page 223 of 3957

Procedure 5, Electronic Surveillance

- In the United States:
  - Attorney General or the Foreign Intelligence Surveillance Court (FISC) may authorize, except for emergency situations
  - May only conduct such surveillance if both:
    - A significant purpose of the electronic surveillance is to obtain foreign intelligence information; and
    - There is probable cause to believe that the target of the electronic surveillance is a foreign power or an agent of a foreign power

Page 224 of 3957

Procedure 5, Electronic Surveillance

- Outside the United States:
  - U.S. person
    - Governed by FISA and E.O. 12333; or
    - Approval under exigent circumstances exception
  - Non-U.S. person: governed by Title I or Section 702
- Emergency situations: Attorney General approval

- Technical Surveillance Countermeasures (TSCM)
  - Applies to the use of electronic equipment and specialized techniques to determine the existence and capability of electronic surveillance equipment being used by persons not authorized to conduct electronic surveillance

Page 225 of 3957

FISA

- Ensure you are written into the FISA request:
  - Make sure your personnel are authorized, within the request to receive FISA info, and that your equipment is authorized to be used as part of FISA collection.
- Dissemination of FISA derived information must include the caveat that use in any criminal proceeding requires prior approval from the AG.

DEPARTMENT OF JUSTICE

Procedure 6, Concealed Monitoring

- Defined as the following:
  - Hidden electronic, optical, or mechanical devices,
  - to monitor a particular person or a group of persons,
  - without consent,
  - in a surreptitious manner,
  - over a period of time, and
  - no reasonable expectation of privacy

- Examples
  - Video monitoring or sound recording of a subject in a place where he or she has no reasonable expectation of privacy if conducted over a period of time
  - Taking one photograph of a subject would not qualify

Procedure 6, Concealed Monitoring

- Scope: Proc 6 applies to the following:
  - Any person inside the United States, and
  - Any U.S. person outside the United States
- With the appropriate approval and coordination, we may conduct concealed monitoring . . .
  - In the United States
    - On DoD facilities
    - Outside DoD facilities after coordination with the FBI
  - Outside the United States
    - On DoD facilities
    - Outside DoD facilities must be coordinated with the CIA, and appropriate host country officials in accordance with any applicable SOFA or other international agreement

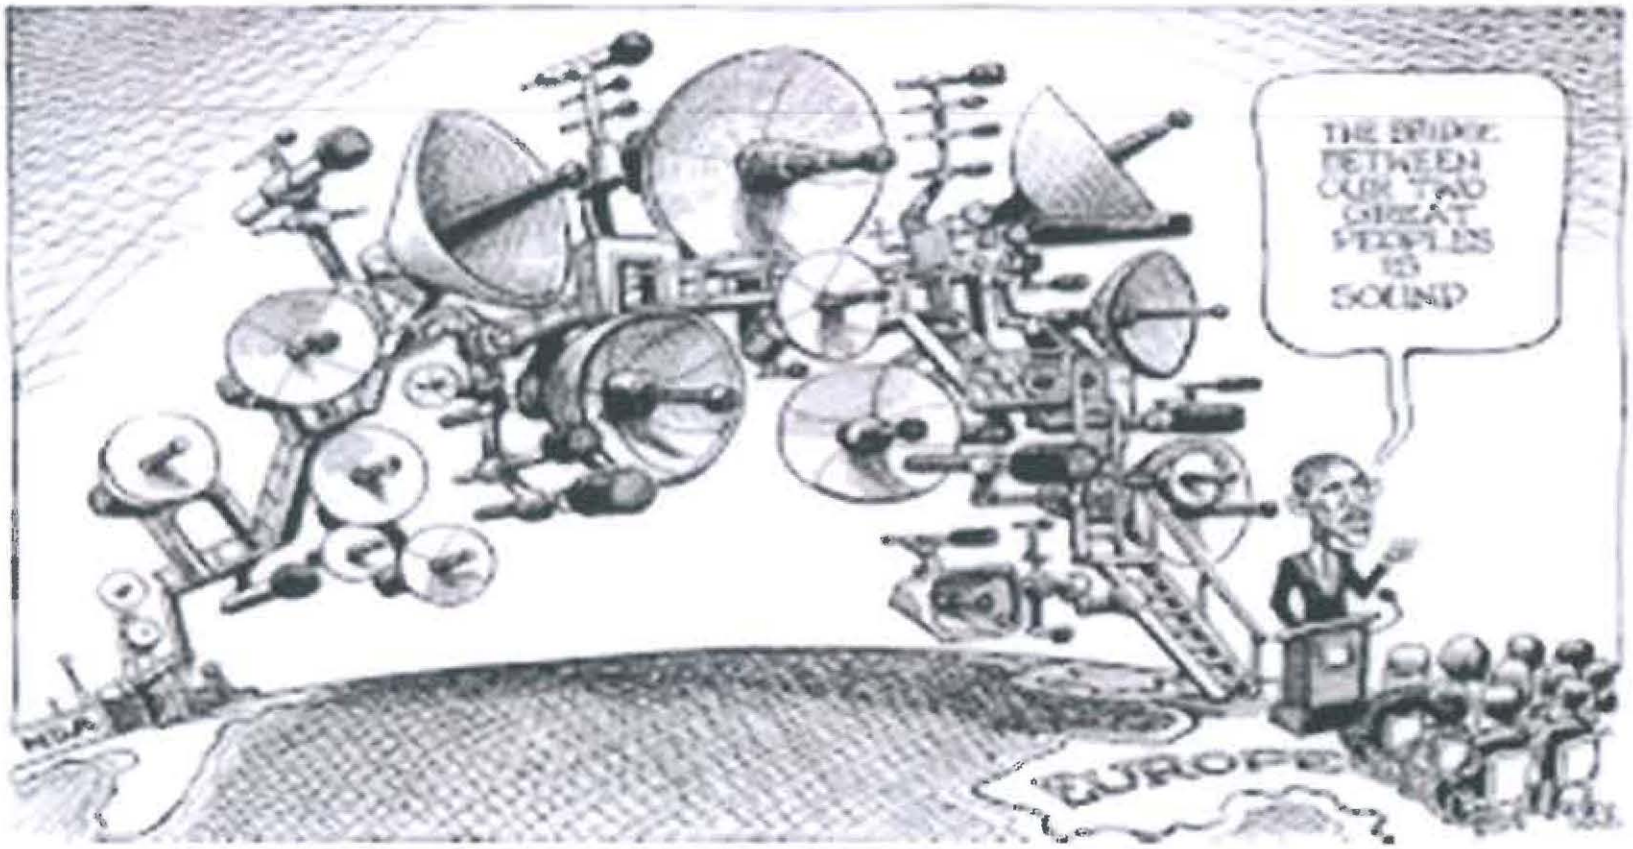
Page 228 of 3957

Procedure 6, Concealed Monitoring

- Approval: Component head or delegee
- Component legal is required to determine whether the following criteria have been met:
  - There is no reasonable expectation of privacy;
  - Such monitoring is necessary to conduct an assigned CI function;
  - A trespass will not be necessary to effect the monitoring; and
  - The monitoring is not subject to Procedure 5
- For more on trespass, see U.S. v. Jones, Sup. Ct. (2012)
  - Physical attachment of GPS tracking device on vehicle to monitor its movement is a trespass/search under Fourth Amendment

Page 229 of 3957

Taking a Moment...



Page 230 of 3957

Procedure 7, Physical Searches

- Scope: Applies to *nonconsensual* physical searches in the United States *and* of U.S. persons/property outside the United States
- Defined: Any intrusion on a person or property that would require a *warrant* for law enforcement purposes
- Does *not* include examinations of the following:
  - Areas that are in plain view and visible to the unaided eye if there is no physical trespass;
  - Publicly available information;
  - Abandoned property in a public place;
  - Items where we have consent; and
  - Government property pursuant to Military Rule of Evidence 314(d)

Page 231 of 3957

Procedure 7, Physical Searches

- **Approval Required**
  - Search of active duty: Attorney General or Foreign Intelligence Surveillance Court
  - Search of other persons inside the United States
    - We may NOT conduct searches of other persons in the U.S.
    - We may request the FBI to conduct such searches
  - Other U.S. persons outside the United States
    - The search is for an authorized CI purpose;
    - The search is appropriately coordinated with the CIA; and
    - The FISC or the Attorney General has authorized the search.
    - Who may request: SecDef, DSD, USD(I); SecAF; USecAF; DIRNSA/CHCSS; Director, DIA; Director, NGA; or Director, NRO

Page 232 of 3957

Procedure 8, Mail Searches and Cover

- **Mail Searches**
  - See Procedure 7

- **Mail cover, e.g., examination of envelope**
  - In U.S. postal service channels, request the USPS IAW 39 CFR 233.3(e)(2)
  - In foreign postal channels, may request a mail cover for mail that is to or from a U.S. person consistent foreign law and any applicable SOFA

Page 233 of 3957

Procedure 8, Mail Searches and Cover

- Any National Security mail cover request must be approved personally by the head of the law enforcement agency or intelligence component requesting the cover or the one designee at the agency's headquarters
- Original signed copy is forwarded to Chief Postal Inspector
- Postal has cleared facilities, request/justification must be specific to case details

Procedure 9, Physical Surveillance

- **Who can we surveil in the United States:**
  - Military service members;
  - Present or former military or civilian employees of a DIC;
  - Present or former contractors of a DIC;
  - Present or former employees of such a contractor;
  - Applicants for such employment or contracting;
  - Non-U.S. persons; and
  - Other persons, "when detailed to the FBI or when operating under FBI authorities."

Page 235 of 3957

Procedure 9, Physical Surveillance

- **Scope**
  - Any person inside the United States or any U.S. person outside the United States
  - Applies to any devices used to observe the subject of the surveillance (not Procedure 6)

- **Defined**
  - Deliberate and continuous observation of a person, and
  - Where the person has no reasonable expectation of privacy
  - Does <u>not</u> apply to surveillance detection or counter surveillance used to detect and elude foreign physical surveillance

Page 236 of 3957

DoD Intelligence Components

- NSA
- DIA
- The offices within the Department of Defense for the collection of specialized national foreign intelligence through reconnaissance programs.
- The Assistant Chief of Staff for Intelligence, Army General Staff.
- The Office of Naval Intelligence.
- The Assistant Chief of Staff, Intelligence, U. S. Air Force.
- The Army Intelligence and Security Command.
- The Naval Intelligence Command.
- The Naval Security Group Command.
- The Director of Intelligence, U.S. Marine Corps.
- The Air Force Intelligence Service.
- The Electronic Security Command, U.S. Air Force.
- The counterintelligence elements of the Naval Investigative Service.
- The counterintelligence elements of the Air Force Office of Special Investigations.
- The 650th Military Intelligence Group, SHAPE.
- Other organizations, staffs, and offices, when used for foreign intelligence or counterintelligence activities to which part 2 of E.O. 12333 (reference (a)), applies, provided that the heads of such organizations, staffs, and offices shall not be considered as heads of DoD intelligence components for purposes of this Regulation.

Procedure 9, Physical Surveillance

- **Approval and coordination**
  - **Approval: Component head or delegee**
  - **Coordination**
    - **In the United States**
      - No coord req'd for on-base surveillance of active duty
      - FBI coord for all off-base surveillance
      - FBI coord for on-base surveillance of non-active duty
    - **Outside the United States**
      - CIA for off-base surveillance
      - Consider with SOFA and foreign law/policy

Procedure 10, Undisclosed Participation

- Scope: Governs the participation by DICs and anyone acting on behalf of a DIC, e.g., sources, in any organization in the United States or any organization outside the United States that constitutes a U.S. person.
- Organization defined
  - An association of two or more individuals formed for any lawful purpose whose existence is formalized in some manner
  - Includes those that meet and communicate through the use of technologies
- Participation defined
  - When a person is tasked or asked to participate in an organization for the benefit of the DIC
  - Actions undertaken "for the benefit of" a DIC may include collecting information, identifying potential sources or contacts, or establishing or maintaining cover.

Page 239 of 3957

Procedure 10, Undisclosed Participation

- Exclusions
  - Personal participation
  - Voluntarily provided information
  - Publicly available information on the Internet
    - Collection of publicly available information on the Internet in a way that does not require a person to provide identifying information (such as an email address) as a condition of access and does not involve communication with a human being

- Approval level depends on the activity—see below
  - No specific level of approval (NOT no approval)
  - Component head or delegee
  - Component head or single delegee

Page 240 of 3957

Procedure 10, Undisclosed Participation

- UDP requiring no specific level of approval
  - Education or training
  - Cover Activities: Participation in an organization solely for the purpose of obtaining or renewing membership status *in accordance with DoD cover policy*
  - Published or posted information: Participation in an organization whose membership is open to the public solely for the purpose of obtaining information published or posted by the organization or its members and generally available to members; must not involve elicitation.
  - Public forums: Employment affiliation not req'd and no elicitation of USPI; and
  - Foreign entity: Participation in an organization that is an entity openly acknowledged by a foreign government to be directed or operated by that foreign government or is reasonably believed to be acting on behalf of a foreign power, and the organization is reasonably believed to consist primarily of individuals who are non-U.S. persons.

Page 241 of 3957

Procedure 10, Undisclosed Participation

- UDP That May Be Approved by a component head or delegee
  - Non-U.S. persons as potential sources of assistance
  - Public forums: employment affiliation required or elicitation of USPI may be authorized
  - Cover activities: beyond obtaining or renewing membership for the purpose of maintaining or enhancing cover
  - U.S. person organizations outside the United States: involving participation from or about a non-U.S. person located outside the United States

Procedure 10, Undisclosed Participation

- **UDP That May Be Approved by a Defense Intelligence Component Head or a Single Delegee**
  - To conduct authorized CI activities not otherwise addressed in or outside the United States, after required coordination with the FBI or CIA.
  - To collect information inside the United States necessary to identify a U.S. person as a potential source of assistance to foreign intelligence or CI activities.
  - To collect information outside the United States necessary to assess a U.S. person as a potential source of assistance to foreign intelligence or CI activities

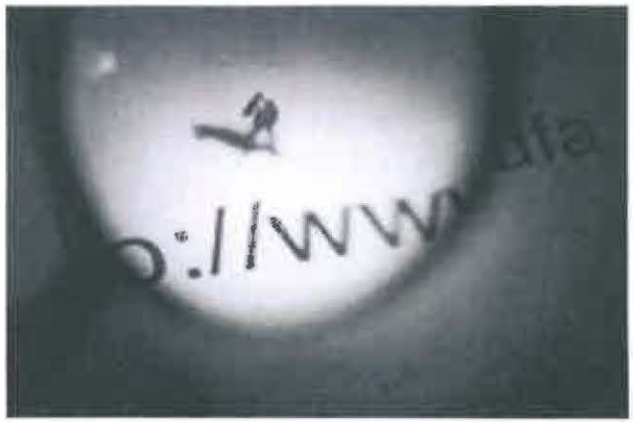
Page 243 of 3957

Procedure 10, Undisclosed Participation

- **Standards for review and approval: approving official must make the following determinations:**
  - **The potential benefits to national security outweigh any adverse impact on civil liberties or privacy of U.S. persons**
  - **The proposed UDP complies with the limitations on UDP; and**
  - **The proposed UDP is the least intrusive means feasible and conforms to the requirements of Procedure 2**

UDP Online/ Social Networking Sites

- Undisclosed Participation is applicable in the CYBER world…
- Is the website an organization/USP? Look to facts:
  - Primarily US users
  - Location of the server
  - Incorporation
  - Website content
  - Language used
  - Richard Shriffin memo
- Other matters
  - Cover Plan?
  - De-confliction?



Take a Moment . . .
(for our LE friends)

Page 246 of 3957

Agenda, Part 4

- Additional Legal Authorities / Special Collection
  - Bank and National Security Letters
    - Right to Financial Privacy Act (12 USC §3401)
    - Fair Credit Reporting Act (15 USC §1681(v))
    - Requests by Authorized Investigative Agencies (50 §USC 3162)
    - FBI Request for Telephone Toll and Transactional Records (18 USC §2709)
  - DoD IG Subpoena
  - Electronic Communications Privacy Act (ECPA), 18 USC §2701
  - Computer Trespasser Exception, 18 USC §2511(2)(i)

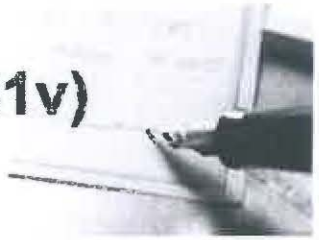
Page 247 of 3957

National Security Letters (NSLs)

- Several Federal statutes authorize intelligence officials to request certain business record information in connection with national security investigations.
- Prospects of continued NSL use is dimming
- What Congress gives, Congress can take away, but for now…..

Summary: Types of NSLs

- Financial Information - Bank Letter (12 USC 3414)
  - Non-compulsory for DoD
    - FBI has authority to compel per para (a)(5)(A)
- Credit Reporting Agency Letter (15 USC 1681v)
  - Compulsory
  - International terrorism only
- Security Clearance Investigations (50 USC 3162)
  - Requires consent; check SF 86 Paperwork!
  - Gets you Bank Records, Credit Reports and Travel Records
  - Compulsory
- Telephone and Toll Records/ISP (18 USC 2709)
  - Available only to the FBI



NSL - Bank Letter, 12 USC § 3414

- **What type of records?**
  - Any record held by a financial institution pertaining to a customer's relationship with the financial institution
  - Customer need not be the target of the investigation
  - Financial institutions broadly defined

NSL - Bank Letter, 12 USC § 3414

From whom can we request?

- Bank
- Savings bank card issuer
- Industrial loan company
- Trust company
- Savings association
- Building and loan, or homestead association (including cooperative banks)
- Credit union
- Consumer finance institution
- Broker registered w/ SEC

- Pawn broker
- Insurance Company
- U.S. Postal Service
- Dealer in jewels and precious stones
- Travel Agency
- Vehicle sales
- Casinos
- Persons involved w/ real estate closings

NSL - Credit Reporting Agency, 15 USC §1681v

- What type of records?
  - Customer credit reports and all other customer records
- Who can we compel to provide?
  - Consumer Reporting Agencies

EQUIFAX
experian
TransUnion

- When?
  - Must be related to International Terrorism

NSL - Security Clearance Investigations, 50 USC § 3162

- What type of records?
  - Financial records
  - Records pertaining to travel outside the U.S.

- Who can we request from?
  - Financial Institutions
  - Credit reporting agencies
  - Commercial entities within the U.S. with records refl travel outside the U.S.

NSL - Security Clearance Investigations, 50 USC § 3162

- TARGET
  - Executive Branch Employee
  - Who as *a condition of access to classified information*
  - Provided consent (during background investigation)
  - for a period of not more than 3 years thereafter to financial and travel records;

AND

Reasonable grounds to believe that the target

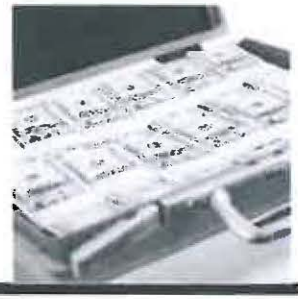
- is or may be disclosing classified info in an unauthorized manner to a foreign power or agent of a foreign power

Or

- has incurred excessive indebtedness or has acquired a level of affluence which cannot be explained by other info;

Or

- had the capability and opportunity to disclose classified info which is known to have been lost or compromised to a foreign power or agent of a foreign power



NSL Summary Chart

Profile of the Current NSL Statutes

NSL Statute	18 U.S.C. 2709	12 U.S.C. 3414	15 U.S.C. 1681u	15 U.S.C. 1681v	50 U.S.C. 3162
Addressee	communications providers	financial institutions	consumer credit agencies	consumer credit agencies	financial institutions, consumer credit agencies, travel agencies
Certifying officials	senior FBI officials and SACs	senior FBI officials and SACs; or supervisory official of a rank designated by the head of the investigating agency	senior FBI officials and SACs	supervisory official of an agency investigating, conducting intelligence activities relating to or analyzing int'l terrorism	senior officials no lower than Ass't Secretary or Ass't Director of agency w/ employees w/ access to classified material
Information covered	identified customer's name, address, length of service, and billing info	identified customer financial records	identified consumer's name, address, former address, place and former place of employment	consumer report and all other information in a consumer's file	all financial information and foreign travel records relating to consenting employee
Standard/ purpose	relevant to an investigation to protect against int'l terrorism or clandestine intelligence activities	sought for foreign counterintelligence purposes to protect against int'l terrorism or clandestine intelligence activities	sought for an investigation to protect against int'l terrorism or clandestine intelligence activities	necessary for the agency's investigation, activities, or analysis of int'l terrorism	necessary to conduct a law enforcement investigation, CI inquiry or security determination

DoD IG Subpoena

- DoD IG Subpoenas may be used to Support Non-Fraud related investigations when
  - There is sufficient DoD nexus to the crime at issue to warrant the DoD IG's involvement in the investigation
    - Meaning (1) Agency must have investigative authority for the crime under investigation and (2) if the investigation is being conducted jointly the DoD entity must be designated the "lead investigative organization" and
  - The particular crime at issue of such a nature and/or such concern to DoD as to warrant the DoD IG's involvement in the investigation
    - Terrorism, Espionage, Agent for Foreign Government, Spies, Aiding the enemy are among the 25 delineated crimes

DoD IG Subpoena

- Documents and instructions available on DoD IG Website at

http://www.dodig.mil/Programs/Subpoena/subpoena.html

Page 257 of 3957

Mechanisms for Acquiring ISP data

- Request FBI pursue an NSL for Telephone Toll and Transactional Records, IAW 18 USC 2709
  - This option is NOT available to DoD entities in unilateral cases
  - Provides Subscriber Data and toll billing records, along with electronic comm transactional records

- 18 USC 2703 offers several mechanisms that a government entity may use to compel disclosure

Electronic Communications Privacy Act (ECPA)

- BLUF: USGOV can't access emails, data logs or subscriber data with nothing in hand
- ECPA governs information stored on Public Internet Service Providers (ISPs) and on Public Networks
  - Fewer requirements for private networks, such as DoD's
  - Plus, we obtain consent through Banner/User Agreement/IA Training
- General rule for ECPA: it is unlawful to access, obtain, alter or prevent access to wire or electronic communications while in storage by a provider of such communications services

ECPA Summary Chart

Page 260 of 3957

Preservation Letters

- If contemplating action under ECPA the first step is to PRESERVE the stored comms/data
- Requirement to preserve records or evidence in the ISP's possession pending the issuance of court order or other process for 90 days (additional 90 day extension is available) per 18 USC 2703(f)
- How to identify the ISP POC:
  - http://www.copyright.gov/onlinesp/list/a_agents.html (Service Provider's agents for notification of claims of copyright infringement)
  - http://www.search.org/resources/isp-list/

Computer Trespasser Exception, 18 USC §2511(2)(i)

- **Live monitoring of Internet/network communication is lawful provided the four (4) criteria are met:**
  - **1. The owner or operator of the protected computer must authorize the interception of a trespasser's communications.**
  - **2. The person intercepting the communication must be lawfully engaged in an ongoing investigation.**
  - **3. The person intercepting the communication must have reasonable grounds to believe that the contents of the communications to be intercepted will be relevant to the ongoing investigation.**
  - **4. The monitoring must be configured so that it only intercepts the trespasser's communications.**

Taking a moment...

Page 263 of 3957

Agenda

- Material Support to Terrorism (MST) Statutes (18 USC §§ 2339A and 2339B)
- Protection of Defense Information
  - 18 USC §793 - 18 USC §798
  - 18 U.S.C. §1924
  - Classification Reviews and CIPA
- Sanctions
  - TWEA and IEEPA (Dept of Treasury)
- Export Control
  - International Traffic in Arms Regulations (Dept of State)
  - Office of Foreign Assets and Control (Dept of Commerce)

Material Support to Terrorists (MST) Statutes

- "Material support" includes almost any kind of support for blacklisted groups; including humanitarian aid, training, expert advice, "services" in almost any form, and political advocacy.
  - Intent to further the illegal activities of the terrorist organization (presumption that any contribution to a terrorist organization furthers or facilitates criminal activity)

- 18 USC § 2339A Providing material support to terrorists
- 18 U.S.C. § 2339B Providing material support to designated foreign terrorist organizations

MST Applicability to You

- The term "whoever" within the statute and legislative history includes "government actors"
  - Ensure you and your assets are covered!
  - This can be a timely approval process so plan accordingly

- Each Agency has its own
  - Approval policy
    - Lethal Aide
  - Coordination with DOJ

Protection of Defense Information (18 USC 793-798)

- It all started with the Espionage Act of 1917
  - It originally prohibited any attempt to interfere with military operations, to support U.S. enemies during wartime, to promote insubordination in the military, or to interfere with military recruitment.
  - Passed along with the Trading with the Enemy Act
  - Espionage Act was based on the Defense Secrets Act of 1911, especially the notions of obtaining or delivering information relating to "national defense" to a person who was not "entitled to have it"

Page 267 of 3957

Statutes

- 18 USC § 793 - Gathering, transmitting or losing defense information
- 18 USC § 794 - Gathering or delivering defense information to aid foreign government
- 18 USC § 795 - Photographing and sketching defense installations
- 18 USC § 796 - Use of aircraft for photographing defense installations
- 18 USC § 797 - Publication and sale of photographs of defense installations
- 18 USC § 798 - Disclosure of classified information

Use of Classified Information in Court

- For these types of cases you will need the compromised information reviewed for an evaluation of harm to national defense if released and approval for use in charging/ trial
  - This will be a timely and occasionally an "emotional" experience
  - Prior to 2015, DoJ was requiring SECRET or above to charge
- Classified Information Protection Act (CIPA) and MRE Rule 505 provide for protection of the classified information during court proceedings
- False Flag Operations

Sanctions and Export Controls

- The principal statutes underpinning U.S. sanctions and embargos are administered by the Department of the Treasury:
  - The Trading With the Enemy Act (TWEA)
  - International Emergency Economic Powers Act (IEEPA)

These sanctions are further codified by:

- Office of Foreign Assets and Control (Department of Commerce)
- Arms Export Control Act via International Traffic in Arms Regulations (Department of State)

Sanctions: IEEPA (50 USC §§1701-1707)

- Authorizes the POTUS to regulate commerce with certain persons/countries after declaring a national emergency in response to an unusual and extraordinary threat from a foreign source.
  - Country or designated nationals list
  - Non-Proliferation Sanctions
  - Counter Terrorism Sanctions
  - Counter Narcotic Sanctions
  - Transnational Criminal Orgs

- Administered by Dep't of Treasury
- Restrictions apply to all U.S. persons and entities…

Sanctions: Office of Foreign Assets and Control (OFAC)

- OFAC administers a number of different sanctions programs. The sanctions can be either comprehensive or selective, using the blocking of assets and trade restrictions to accomplish foreign policy and national security goals
- OFAC oversees, imposes penalties pursuant to, and grants licenses to permit activities covered by U.S. sanctions.
- Fines for violations: $50K to $100K and imprisonment from 10 to 30 yrs for willful violations.

OFAC Licenses

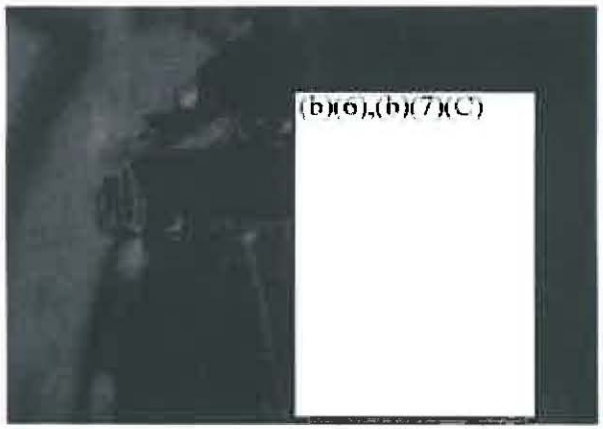
- There are two types of licenses:
  - A general license authorizes a particular type of transaction for a class of persons without the need to apply for a license.
  - A specific license is a written document issued by OFAC to a particular person or entity, authorizing a particular transaction in response to a written license application.
- Persons engaging in transactions pursuant to general or specific licenses must make sure that all conditions of the licenses are strictly observed.

Arms Export Control Act (Inter'l Traffic in Arms Regs)

- Administered by the Department of State
- 22 USC §2778 of the Arms Export Control Act (AECA) provides the authority to control the export of defense articles and services
- Executive Order 11958, as amended, delegated this statutory authority to the Secretary of State.
- International Traffic in Arms Regs (ITAR) implements this authority

ITAR (22 USC §2778)

- All U.S. manufacturers, exporters, and brokers of defense articles, defense services, or related technical data, as defined on the USML, are required to register with U.S. Department of State
- A foreign person is any person who is not a lawful permanent resident of the U.S. and includes foreign governments and organizations



ITAR Exceptions

- ITAR does not apply to information related to general scientific, mathematical or engineering principles that is commonly taught in schools and colleges or information that is (legitimately) in the public domain
- Each agency has own procedures and approvals for dealing with ITAR controlled items.

Cognitive-Emotional Conflict

Adversary Will and Social Resilience

By Linton Wells II

Today's information sharing tools let adversaries interfere more directly than ever with a targeted nation's political processes and the minds of its citizens.[1] Operating effectively in such "cognitive-emotional conflict" requires that information-based capabilities be employed and countered in agile, integrated ways across the military, government, and society.[2] Coherent narratives tied to strategy and backed by actions are important.[3] Technical cyberspace activities need to be well-coordinated with content-based approaches like military information operations, government-wide messaging, and intelligence gathering (including all forms of security).[4] Even more important is to build a society's resilience against persistent, disruptive, or disinformation campaigns that aim to undermine citizen confidence and core beliefs.[5]

The need for effective messaging is nothing new—targeting the minds of opposing leaders and the morale of their forces has been central to warfare from time immemorial. Historically, galvanizing public opinion in democracies usually has taken dramatic acts, from the Boston Massacre, to Pearl Harbor, to 9/11. Less dramatically, waning public opinion led President Bush to the Surge in Iraq, and President Obama to adjust his approach in Afghanistan. Activists today, however, have much more direct access to growing numbers of citizens, either to advocate for positions, muddy the waters of public opinion with alternative facts and fake news, or leak secrets to wide audiences. Empowered individuals and small groups can leverage media to enhance their impact by ensuring their asymmetric actions against people, societal structures, or military forces are much more widely disseminated. Some information activities will involve cyberspace operations, while some will involve more traditional information means. In any case, government communication tools such as press releases, white papers, web posts, or even leadership speeches rarely are effective counters to these information flows, especially when poorly coordinated.

The U.S. military and intelligence communities are starting to integrate their capabilities better, but implementing whole-of-government approaches is proving much harder owing to diverse interests, capabilities, and understandings of the information environment. Strengthening society's overall resilience to such campaigns is

Dr. Linton Wells II is a Visiting Distinguished Research Fellow at National Defense University. A retired U.S. Navy officer with more than five decades of public service, Dr. Wells served as Deputy Under Secretary of Defense and twice as Principal Deputy Assistant Secretary of Defense.

Page 280 of 3957

even more difficult, and also more important. A variety of reasons, from lack of trust to lack of capability, make it hard for most Western governments to craft and promote effective resilience campaigns. That said, transparency ultimately is a powerful asset, and where checks and balances, horizontal information flows, and citizen engagement exists, societies can adapt and become more resilient to cognitive-emotional attacks. However, the Strategic Multi-Layer Assessment (SMA) and others are doing important work on fake news inoculation and enhancing population resilience, as well as the use of neuroscience to help understand subconscious decisionmaking.[6] Positive steps to reframe and refocus arguments can be used to counter disinformation campaign tactics.[7]

The Continuum of Conflict

Where does cognitive-emotional conflict fit into the broader continuum of conflict that exists today? First one must define the continuum. Strategist Frank Hoffman at National Defense University defines this as measures ranging from "short of armed conflict" to "major theater war."[8] The spectrum includes an "unconventional and special warfare" category that cuts across the entire continuum of violence.[9] Most of the conflicts today fall into the blue and green zones identified in Figure 1.

Measures Short of Armed Conflict

A proposed definition is the employment of covert or illegal activities that are below the threshold of violence. This includes disruption of order, political subversion of government or non-governmental organizations, psychological operations, abuse of jurisprudence, and financial corruption as part of an integrated design to achieve strategic advantage.[10]

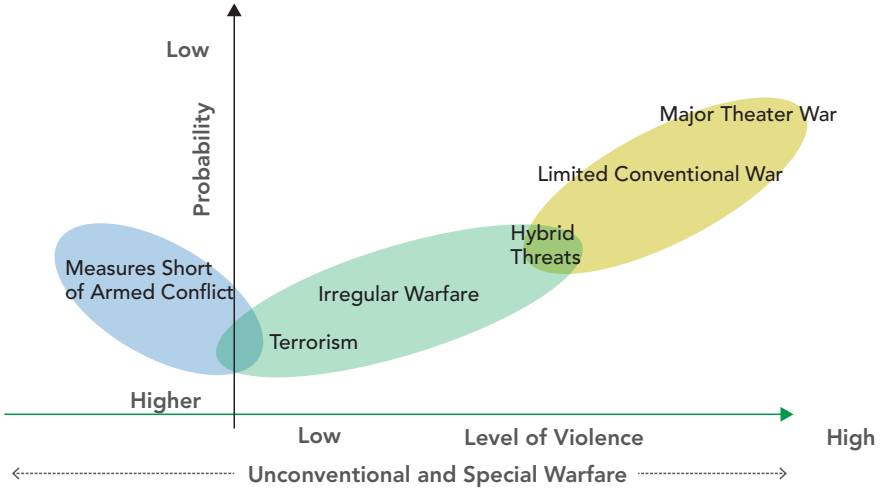
Irregular Warfare and Terrorism

Existing U.S. doctrine defines irregular warfare as a "violent struggle among state and non-state actors for legitimacy and influence over the relevant populations."[11] Irregular warfare is characterized by indirect and asymmetric approaches that avoid direct and risky confrontations with strong forces.[12] Irregular warfare may include criminal activity and/or terrorism.

Hybrid Threats

Hoffman defines this group as the "tailored violent application of advanced conventional military

FIGURE 1: Continuum of Conflict.



capabilities with irregular tactics, or combination of forces during armed conflict."[13]

Theories of Conflict and Resilience

War is "an act of force to compel the enemy to do your will"—fair enough, but a complementary formulation is "… supreme excellence [in war] consists in breaking the enemy's resistance without fighting."[14] Within the continuum of conflict, breaking the resistance of *both* civilian and military adversaries without fighting major wars is an increasingly common objective.

Key arguments in this area were introduced by John Arquilla and David Ronfeldt in their 1993 article "Cyberwar is Coming!"[15] that first introduced the concept of "cyberwar"—"the idea that the vulnerability of communications could cripple an advanced army" by "disrupting, if not destroying, information and communication systems…on which an adversary relies in order to *know itself*…"[16] Cyberwar has proven hard to define, and is not included in the official U.S. military lexicon, but "cyberspace operations" are, and they are associated with powerful technical components, usually considered to be offensive cyberspace operations (OCO), defensive cyberspace operations (DCO), and computer network exploitation (CNE).[17] Such operations can impact most conflicts, but often they have been treated as technical capabilities injected from a parallel, networked universe, rather than integrated as part of an overall campaign. However, Arquilla's and Ronfeldt's seminal 1993 article not only discussed how the information age is altering the nature of all conflict, but also introduced the concept of "netwar" in which actors seek to "disrupt, damage, or modify what a target population knows or thinks it knows about the world around it."[18] Today cyberspace operations closely relate to cyberwar with potential impacts on military systems, critical infrastructures, etc., while netwar is increasingly relevant to the cognitive and emotional disruption of societies.[19]

Worldwide, hundreds of billions of dollars are spent to defeat enemies on high-intensity battlefields. Such capabilities are necessary, but insufficient. A variety of cognitive-emotional campaigns are underway, from sustained efforts to undermine respect for liberal democratic values, to initiatives to establish new geopolitical "facts" in East Asian waters. Those suggest that the center of gravity for at least some conflicts is shifting away from military forces toward the political processes, thought leaders, and social media of the targeted populations. Rather than inciting a population to take a particular action, as the leak of the Zimmerman telegram did in accelerating the U.S. entry into World War I, campaigns today often seek to fragment citizen opinions and disrupt belief systems. The ultimate resilience of a nation or an alliance lies in the minds of its citizens who today are under persistent pressure.

There are many definitions of resilience, the best of which include proactive pre-crisis preparations and risk mitigation, effective incident management, and leveraging whatever shocks occur to build back better, as probability scholar Nassim Taleb advocates in his work, *Anti-Fragile: Things That Gain From Disorder.*[20] The Rockefeller Foundation defines resilience as:

> *The capacity of individuals, communities and systems to survive, adapt, and grow in the face of stress and shocks, and even transform when conditions require it. Building resilience is about making people, communities and systems better prepared to withstand catastrophic events—both natural and manmade—and able to bounce back more quickly and emerge stronger from these shocks and stresses.*[21]

The summary of resilience should therefore move from "bounce back" to "be prepared to bounce forward better."[22] How to strengthen the resilience of societies deserves more attention in conflict studies.

Cognitive-Emotional Conflict

Continued, long-term campaigns of disruption, perception management, and deception sow confusion and undercut values and convictions.[23] These campaigns are but one element of cognitive-emotional conflict. Many of their components are not new. They involve violence and the threat of violence, integrating kinetic and non-kinetic elements in ways that would be fully understood by Sun Tzu, Clausewitz, or John Boyd.

The American way of war historically has favored kinetic approaches in environments that clearly distinguish between combat and non-combat, where "one side distinctively wins while the other distinctively loses."[24] Violent action and its connection to policy have long been at the heart of Western military thought, but there also are complementary strategies. Sun Tzu did not clearly delineate between a state of peace and war, though violence and the threat of violence were part of his conception of statesmanship.[25] He did emphasize the importance of deception, perhaps since it helped the leader to "flow" between various states of conflict. Twentieth century military strategist John Boyd later addressed both the offensive and defensive sides of cognitive approaches, noting that strategy should "magnify and augment our inner spirit and strength" while swaying the uncommitted. It should also "isolate adversaries from their allies…[and from] one another, in order to magnify their internal friction, produce paralysis, bring about their collapse…so that they can no longer inhibit our vitality and growth."[26]

Information-based acts in cognitive conflict draw on many tools to "confuse, befuddle, discourage, confound, depress, deny, destroy, degrade, disrupt, usurp, corrupt, deter/dissuade, disconnect, cost-impose, dispose, convey weakness or worse, engender fear (or respect), herd/vector in desired direction and generally negatively impact on victims'/adversaries' ability to see, know, understand, command/control/access his own means, decide, act and be confident of his/her posture, processes or destiny… [These] actions will likely be applied around critical times."[27] Clearly they have been employed before in high-intensity wars (the deception operations surrounding Normandy), other armed conflicts (direct adversary messaging to populations during the Vietnam War and the First Intifada), and in measures short of armed conflict (propaganda and false news to undermine the legitimacy of governments or belief systems).

What is new today is the ease by which modern communications allow adversaries to bypass military forces, borders, and alliances to magnify their voices in the minds of our people, our adversaries, the uncommitted, and our allies.[28] Since experiencing disappointing results in Chechnya in the 1990s the Russians have been refining their "information-psychological" capabilities, which approximate the goals of netwar.[29] Parts of China's "three [unconventional] warfares" relate to efforts to implement "political work."[30] As future cyberspace activities evolve to destroy physical systems more effectively or disrupt essential services, they provide other ways to undercut the confidence of people in their governments.

There is an ample theoretical basis, and a range of operational capabilities, to support a portfolio of cognitive-emotional strategies, from offensive ones to influence opponents, to persuasive ones to encourage neutrality, to defensive ones to build cohesion. This is broader than a cognitive-emotional campaign in the military sense since key parts fall outside military control. Cognitive-emotional conflict is:

> *A struggle to affect the thoughts and values of people at all levels of an opponent's organization and society, using technical and other informational means, while preserving the resilience of one's own organizations and society, and attracting the uncommitted.*

Within this struggle of understanding an adversary's conscious and unconscious perceptions is the recognition that the process of creating actions to shape perceptions will be iterative. The next step is creating and highlighting mismatches in perceptions and using them as weaponized information to target the mind of the adversary and related populations.[31] Since it is impossible to understand perfectly how an adversary's perceptions can be shaped, messages will need to be tested continuously for effectiveness and adapted. Cognitive-emotional conflict thus extends across the entire continuum of conflict, as shown in Figure 2.

U.S. Advantages and Disadvantages in Cognitive-Emotional Conflict

Daunting as the military challenges may be, there are two greater problems: first, how to address coordination beyond the Department of Defense (DOD) in a whole-of-government framework? And then, how to move beyond government to achieve the kind of "whole-of-society" resilience that the nation, and its alliance partners, will need to face the coming cognitive-emotional challenges? The United States starts with a number of advantages, but also serious weaknesses.

U.S. Advantages in Cognitive-Emotional Conflict

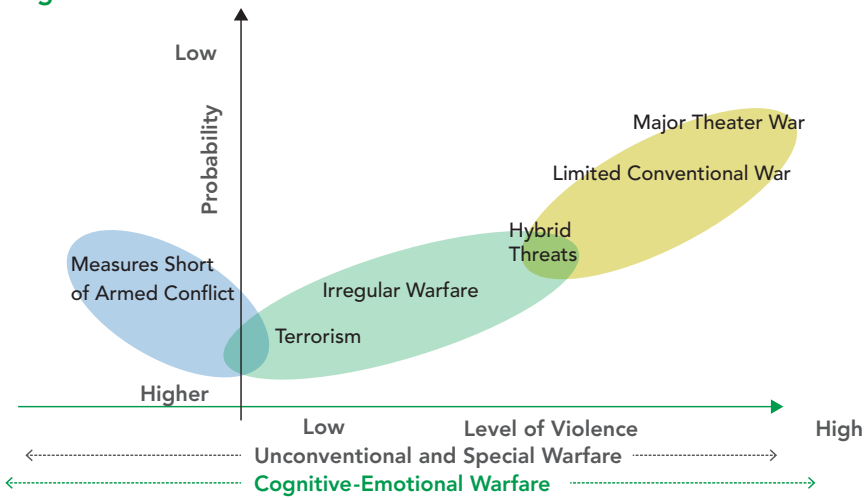
Military/Government Levels

DOD and the Intelligence Community (IC) have exceptional technical cyber capabilities across the full range of OCO, DCO, and CNE as well as many of the non-cyber disciplines, to include electronic warfare, operational deception, space, and command and control. Additionally, Special Operations Forces and parts of the cyber community can adapt quickly to emerging technology and changing circumstances. The U.S. hacking community also is more integrated into the cybersecurity community than in many other countries, partnering through programs like "bugs for bounty" and hackathons.

National Levels

Our diverse population and relatively open system is able to adapt in complex, uncertain environments. Many studies suggest that closed systems begin to lose their adaptability under adversity, and eventually come to be at risk of survival. Such closure can occur either through top down direction (such as isolating a national internet), or a self-selecting series of actions, such as choosing only reinforcing information sources (echo chambers) that limit understanding of a rapidly evolving environment.

FIGURE 2: Cognitive-Emotional Conflict Extends Across the Entire Continuum of Conflict.



Former Dean of Princeton's Woodrow Wilson School of Public and International Affairs, Anne Marie Slaughter, observed in 2009 that the United States ought to have significant advantages in a networked world that derive from the heterogeneity of its population, its geographic location, a horizontal social structure, and a culture of entrepreneurship and innovation.[32]

> *In a networked world, the United States has the potential to be the most connected country…If it pursues the right policies, the United States has the capacity and the cultural capital to reinvent itself.*

The United States possesses the checks and balances, diversity, and feedback loops, and is resilient enough to absorb lessons, learn from them, and adapt. A key is to recognize that "the antidote to netwar poison is active transparency," however painful and disruptive that may be to implement.[33]

U.S. Disadvantages in Cognitive Conflict

The exceptional increases anticipated in science and technology capabilities during the next 15 years will have social impacts as well as operational and strategic ones. Many technology fields such as biotech, robotics, information, nanotech, energy, and additive manufacturing are rapidly changing in parallel. These issues affect the winners and losers in society, the way nations interact, and the way our children think. They raise questions for policymakers, ambassadors, commanders, not just technical specialists. Technological changes, and their interactions, need to be considered as strategic variables in national security planning, but they rarely are today.[34]

Military/Government Levels

The United States and its allies, are not organized, trained, and equipped to be agile and effective in cognitive-emotional conflicts today.[35] U.S. military strengths and doctrine have been aligned more with conventional kinetic conflict than with nuanced cognitive-emotional approaches. Achieving integrated effects at strategic, operational, and even tactical levels is complicated by the way the U.S. now separates cyberspace operations, military information support operations (MISO), intelligence, civil affairs, and related fields into discrete disciplines with distinctive organizations, personnel systems, and operational concepts.[36] Though they often are intended to be mutually supporting, campaigns in each of these areas now may not interact as much as they should to produce integrated effects. Often they are executed at very different levels of classification by skilled operators who are doing their best, but who may be largely unaware of each other's needs and accomplishments.

The problem is compounded by how critical information flows increasingly are outside the government's control—for example, products of geographic information systems (GIS) from sources like commercial satellite imagery and unmanned systems—aerial, ground, and underwater. These are augmented by an explosion of new sensors, from smart phones to augmented reality devices, to the Internet of Things. Finally there is the volume, velocity, veracity, and value of information (IV4) produced by the 24/7 news cycle, amplified and accelerated by social media.

National Level

Most Americans do not recognize the threats posed by cognitive-emotional conflicts and weaponized information. Despite the nation's diversity, most Americans are poorly equipped, through language skills or cultural awareness, to engage deeply in foreign cultures.[37] This can make it hard to recognize that different nation states have different views of concepts such as soft power.[38] For example, Russia thinks of soft power as everything short of outright war (deception, fake news, etc.), while the United States

often views soft power as something that attracts people to American ideals.[39] Such differences make it hard to project, or counter, narratives effectively in foreign environments; particularly given how the United States has cognitive-emotional conflict needs that extend globally, but few of our allies can execute cognitive campaigns beyond regional levels.

The United States thus far has given insufficient attention to crafting and disseminating compelling narratives that shape perceptions. We have allowed our once exceptional capabilities for cognitive-emotional conflict—e.g. in the information campaigns of World War II and the activities of organizations like the U.S. Information Agency during the Cold War—to atrophy, and we lack a consistent national narrative to tell our story. Additionally, U.S. practitioners are bound by asymmetric legal, moral, and ethical constraints that often keep them from being agile enough to compete effectively with skilled adversaries in the realm of social media. This admittedly is a complex problem for any open, democratic society that does not perceive an existential threat.[40]

Consider how Russia's state-owned news outlets routinely deliver government-sponsored messages that are increasingly being accepted as unbiased.[41] And al-Qaeda in Iraq did not need to match U.S. armor or firepower. It only needed to record improvised explosive device (IED) attacks for broadcast to the world. It is much easier to kill one American and broadcast the video to millions than it is to try to kill ten thousand Americans in a combined arms maneuver campaign. Effective cognitive-emotional conflict amplifies small events to create effects in the adversary's mind. Daesh has leveraged these techniques through social media and has broadened its appeal to new regions such as Southeast Asia much more rapidly than expected.[42]

U.S. practitioners of cognitive-emotional conflict need excellent situational awareness, supported by securely networked systems and processes with information flowing as freely as possible, even while trying to disrupt and isolate adversary equivalents. The stovepipes among U.S. tools for cognitive-emotional conflict may be understandable, but they cannot deliver integrated effects. Other nations have fewer artificial restrictions. For example, the Russians, like the Soviets before them, do not separate the intelligence, operations, and communications functions, but rather refer to a more integrated "radio-electronic struggle," which avoids many of the inefficiencies caused by divisions among personnel structures, doctrine, management, etc. These are part of whole-of-government approaches.

Improving the Odds of Success in Cognitive-Emotional Conflict

Some suggest that we are reaching the end of the post–World War II international security structure, pressured by the challenges of a risen China, the resurgence of Russia, worldwide migration, and terrorism, and the various national and transnational responses.[43] The emerging structure is not yet clear, but cognitive and emotional elements certainly will be part of any follow-on conflicts. This section addresses the military, whole-of government, and societal actions that could help prepare for cognitive-emotional conflict in our changing world.

Information as a Joint Warfare Function

In July 2017, Chairman of the Joint Chiefs of Staff, General Joseph F. Dunford, Jr., approved the designation of information as the seventh joint warfare function.[44] This designation of information as the seventh joint warfare function opens up possibilities for coordination that are just now beginning to be examined. A strategy for "Operations in the Information Environment" (OIE) was issued almost one year prior, so there is a basis for considering the closer integration of cyber and content along the full spectrum of doctrine, organization, training, material, logistics, personnel, and facilities—better known as DOTMLPF. Other information-based

components that could benefit from closer integration include but are not limited to:

- strategic communications;
- electronic warfare, to include an electromagnetic pulse (EMP) attack;
- kinetic and non-kinetic operations;
- space and counter-space operations;
- operational security (OPSEC);
- military information support operations (MISO), a.k.a. PSYOPS;
- covert action/propaganda;
- controlled and uncontrolled leaks.[45]

These activities involve different skill sets, agencies, armed services, and even organizational cultures, and should include the Intelligence Community. Half steps are unlikely to be effective but, at the same time, trying to eat the whole elephant at once is likely to be overwhelming. First steps should focus on cross-cutting approaches to a few problems to maximize prospects for near-term successes. On the personnel side, recognize that not everyone will be able to perform well in this environment. Train and educate as broadly as possible, but focus on building a core team of exceptional practitioners.

Already the U.S. Navy has combined its intelligence (N2) and communications (N6) functions into an Information Warfare corps. Could/should similar functions be included by other armed services to improve integration and agility? Ironically, the potential split of U.S. Cyber Command from the National Security Agency may complicate these efforts to breakdown stovepipes.[46]

Alternatively, some have suggested that a new "Joint Concept for Cognitive-Emotional Warfare" be developed to give the idea of cognitive-emotional conflict a larger role in the training, budgetary, and force structure processes. Given the ongoing developments, this probably is premature. The other activities should be allowed to mature.

Reshaping the Broader U.S. Government for Cognitive-Emotional Conflict

The nation needs to convey, by all possible means, the narratives it seeks to represent it. Diplomacy—especially public diplomacy—is on the front line of this campaign, supported by aid programs, and the myriad of other messages the United States projects on a daily basis. Executive Branch departments other than Defense and State have important roles to play, as does industry.

The Department of Homeland Security (DHS), for example, is responsible for protecting the .gov domain and critical infrastructure. DHS has well-defined, whole-of-government management structures in-place for steady state and incident response activities.[47] These structures require collaboration with the private sector through mechanisms such as Information Sharing and Analysis Centers (ISACs) and Organizations (ISAOs), and response to a cyber incident could well be an important part of a cognitive conflict campaign.

Communications need to be aligned with strategy, which must be supported by both narrative and action.[48] Distorted information in a disinformation campaign can be reframed, refocusing can counter distraction, reaffirmation can offset dismissive efforts, and reassurance can address information intended to dismay.

Coordinating these activities is likely to be difficult, given the lack of an agreed U.S. national narrative at present, but it must be tried. Democracies have the added challenge of using information legally and ethically within severe constraints, which often are strained in cognitive-emotional conflict. Decisionmakers have no right to be wrong.

Increasing National Resilience against Cognitive-Emotional Conflict

Government action alone is unlikely to resolve key societal issues, given countervailing moral, legal, and ethical interpretations, as well as suspicions

of the government in many quarters. For example, legal and privacy concerns are critical elements of a democratic society, and they need thorough vetting, even though this may impede rapid action on cybersecurity issues. Impassioned policy discussions over security and privacy have existed since the beginning of the internet, and doubtless will continue in new directions as technology continues to evolve. No one side has all the answers, but the debates are essential, and are a far better approach than top down unitary, directed solutions.

Singapore has postulated a "total defense" concept involving military, civil, economic, social, and psychological components.[49] It recognizes citizen participation as essential as connectivity increases and infrastructures become more interdependent. Signs like "our diversity is our strength" are omnipresent across Singapore. Not every nation can match the tight integration of Singapore's population and their general trust in government. However, as noted earlier, nations that have strong systems of checks and balances, feedback loops, and open information flows have great sources of resilience. These should be nurtured, for they are the basis by which the nation can absorb cognitive-emotional attacks and adjust, over time, to the cognitive-emotional campaigns against them.

At the same time, serious research is needed into the basis of, and limits to, societal resilience in a networked world, especially in democracies. For example, what will be the likely impacts on resilience of disruptions of services through cyberattacks on infrastructures? What differentiates a spirited divergence of views from unbridgeable divisions of worldview? In some cases, neuroscience may be able to provide insights.[50] As these are being worked out, the critical importance of transparency remains. The adjustments are not likely to be quick, smooth, or painless, but they must happen, and represent one of the nation's greatest strengths in cognitive-emotional conflict.

Parting Thoughts

Today's environment is particularly conducive to cognitive-emotional conflicts, owing to the rise of cyber interconnectedness and the range and reach of information sharing tools. There are billions of netizens and billions more will connect during the next few years. This level of connectedness accelerates change and can disrupt many of the policy formulation mechanisms that are legacies of the industrial age, "When decision-makers had time to study a specific issue and develop the necessary response or appropriate regulatory framework."[51] Cognitive-emotional conflict thrives in this dynamic, interconnected environment, and the "weaponization of information" is one way that it can challenge the established order. Actions, both violent and non-violent, can be tailored for nearly instant network dissemination. The nimble player who can shape perceptions generally wins against slow and methodical one.

Success in these sorts of contests requires the nimble, nuanced, and harmonized use, not only of all aspects of national power, but also of non-state and transnational instruments.[52] Strategy, narrative, and actions need to be aligned. Cyberspace operations need to be integrated with "other information-based attacks, defenses, or exploitations as a means for conveying influence, signaling, messaging, or executing strategic communications based on the information-based content itself."[53] All must be supported by intelligence attuned to each area. Decisionmakers and their staffs will need near-real-time situational awareness, yet with options that provide time for reflection. Parts of an engagement will proceed at machine speed with people "on-the-loop," rather than "in-the-loop," while other aspects will require nuanced cultural understanding, sophisticated narratives, and human contact.[54] Throughout, citizens must be informed in credible ways, amidst myriad countervailing information flows, many of them ill-informed at

best, and malicious at worst. Conspiracy theories abound, amplified by information "echo chambers."[55] No organization today—government or civilian—is prepared to deal with all these forces effectively in real-time. PRISM

Notes

[1] This paper represents my personal views and does not reflect the opinions of National Defense University or the U.S. Government. It would not have been completed without major contributions by Maj Phillip Lere, USAF. Dr. Frank Hoffman, Dr. T.X. Hammes, and ADM William O. Studeman, USN (ret.), and Dr. Rebecca Goolsby provided invaluable insights. Any errors are my own.

[2] Cognitive processes involve the acquisition and understanding of knowledge which, while important, are not sufficient to address the full scope of emotions targeted by today's information and disinformation campaigns.

[3] Mark Laity, Director of Strategic Communications at NATO's Allied Command Operations (ACO) repeatedly made this point to a roundtable of senior Southeastern European (SEE) leaders on September 27, 2017.

[4] Cognitive-emotional conflict is defined later in this article. Information Operations are defined in U.S. Joint Publication (JP) 3–13 as "the integrated employment, during military operations, of IRCs [information related capabilities] in concert with other lines of operations to influence, disrupt, corrupt, or usurp the decision making of adversaries and potential adversaries while protecting our own." JP–3-13, November 27, 2012 incorporating Change 1, November 20, 2014, ix. This definition makes it clear that IO primarily applies to military operations, although the "in concert with other lines of effort" could tie into "whole-of-government," or even "whole-of-society" conflicts. For more information see <http://dtic.mil/doctrine/new_pubs/jp3_13.pdf>. RAND notes IO and IW "… also known as influence operations, includes the collection of tactical information about an adversary as well as the dissemination of propaganda in pursuit of a competitive advantage over an opponent." For more information see <https://www.rand.org/topics/information-operations.html>.

[5] Resilience is defined later in this article.

[6] From the SMA description: "The Strategic Multi-Layer Assessment (SMA) provides planning support to Commands with complex operational imperatives requiring multi-agency, multi-disciplinary solutions that are NOT within core Service/Agency competency. Solutions and participants are sought across USG and beyond. SMA is accepted and synchronized by the Joint Staff/J-39 Deputy Director for Global Operations (DDGO) and executed by the Deputy Assistant Secretary of Defense (DASD) for Emerging Challenges and Prototyping (EC&P).

See, for example SMA Panel Discussion: Fake News Inoculation and Enhanced Population Resilience, a Department of State Perspective; Booklet July 6, 2017.

Page 289 of 3957

[7] Dr. Rebecca Goolsby proposes four "Rs" (reframe, refocus, reaffirm and reassure) to counter the four "D"s of disinformation campaigns (distort, distract, dismiss, dismay). Presentation to a roundtable of senior Southeastern European (SEE) leaders on September 26, 2017.

[8] F.G. Hoffman, Exploring a Continuum of Contemporary Conflict, December 2016, unpublished.

[9] Unconventional warfare (UW) is defined by U.S. doctrine as "activities conducted to enable a resistance movement or insurgency to coerce, disrupt, or overthrow an occupying power or government by operating through or with an underground, auxiliary, and guerrilla force in a denied area." JP 3–14, *Unconventional Warfare*, September 2015. This mode of conflict is usually done covertly, with low signatures and limited footprint, and conducted primarily by Special Operations forces.

[10] Hoffman, working definition. In his formulation, "Measures Short of Armed Conflict" include so-called "gray zone" operations, which now are not clearly defined in doctrine. That said, others have provided working definitions of "gray zone activity" as "an adversary's purposeful use of single of multiple elements of power to achieve security objectives by way of activities that are typically ambiguous or cloud attribution, and exceed the threshold of ordinary competition, yet intentionally fall below the level of open warfare." U.S. Strategic Multi-Level Assessment (SMA) Gray Zone Effort Update, February 2017, 1. Special Operations Command (SOCOM) has used "Competition Short of Armed Conflict" (CSAC) in lieu of MSAC, ibid, 3.

[11] First established in the Joint Staff (J7) *Irregular Warfare Joint Operating Concept*, version 1.0, Washington D.C., September 11, 2007.

[12] Irregular Warfare often is abbreviated IW, which is confusing in the context of this paper with Information Warfare. Accordingly, "IW" in this paper only refers to Information Warfare.

DISCLAIMER STATEMENT: This document is provided for educational and informational purposes only. The views and opinions expressed in this document do not necessarily state or reflect those of the United States Government or the Public-Private Analytic Exchange Program, and they may not be used for advertising or product endorsement purposes. All judgments and assessments are solely based on unclassified sources and are the product of joint public and private sector efforts.

Acknowledgments

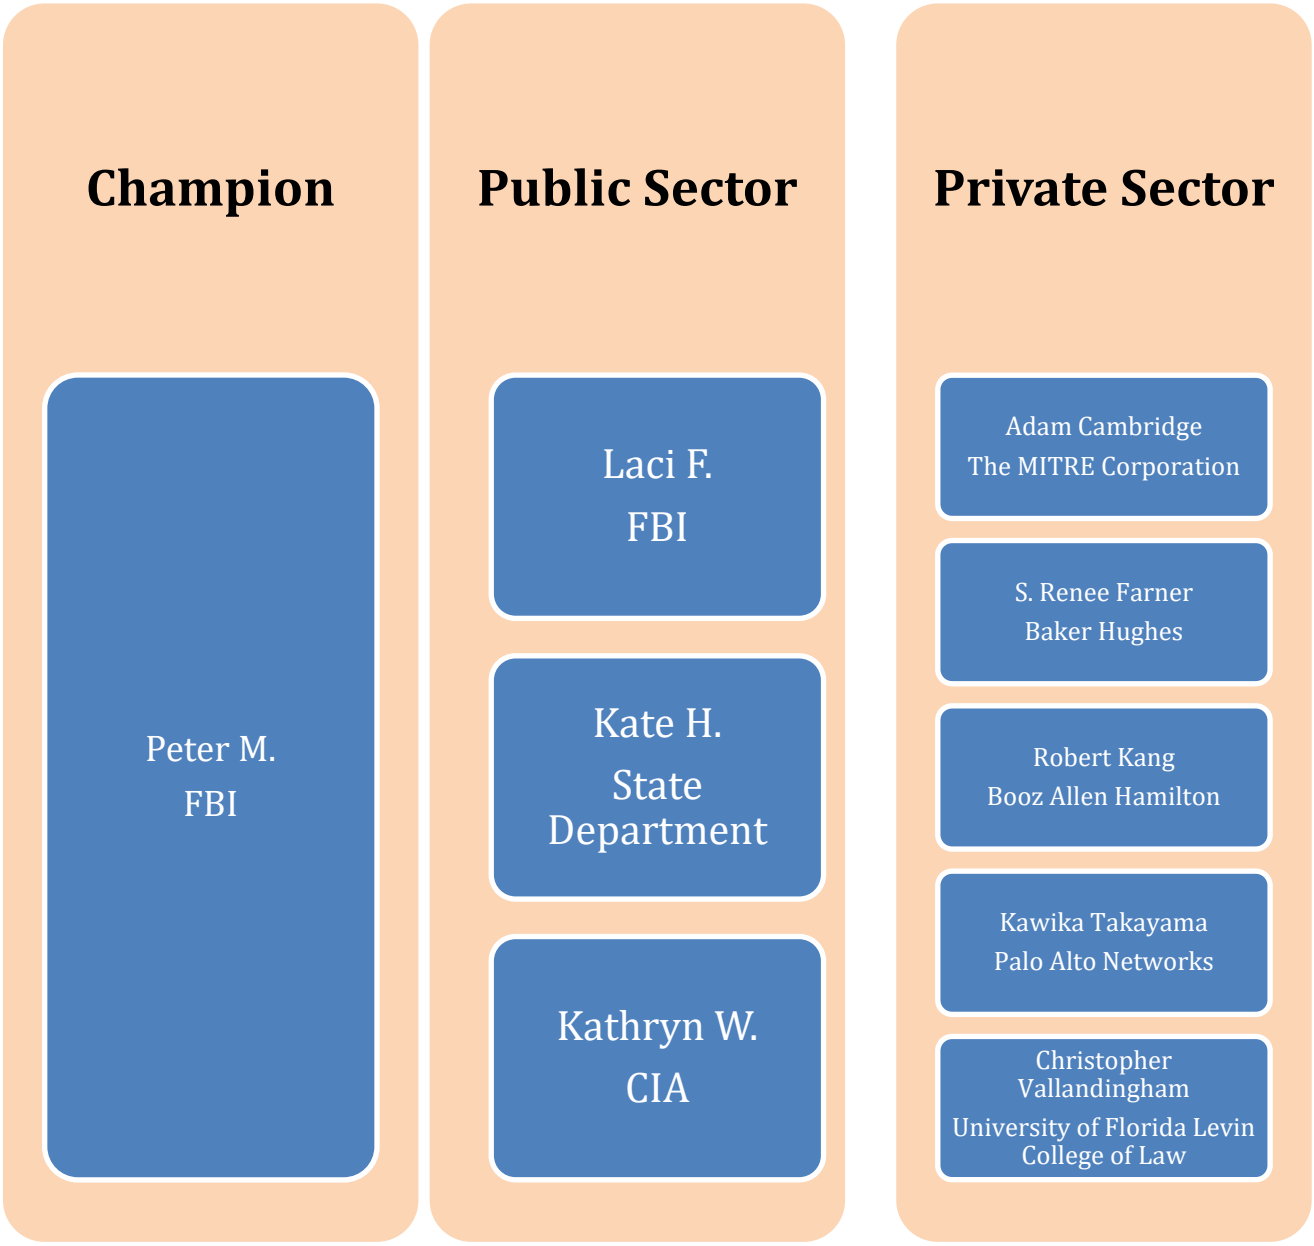
We would like to thank all who contributed to this research amid the unprecedented challenge of the COVID-19 pandemic. This project would not be possible without the assistance of the Office of the Director of National Intelligence and the Department of Homeland Security, who provided us the opportunity to work together on a very important and pressing topic.

We are grateful to the individuals from academia, private sector companies, and think tanks who joined us in our weekly teleconferences to lend their insights on the vexing topic of disinformation campaigns. Their input provided invaluable guidance on lines of inquiry and potential criteria for evaluating the effectiveness of different approaches to countering disinformation campaigns.

We would like to extend a special thank you to Peter M., Team Champion, whose patience and wisdom help guidance us through both years of our project.

We would like to acknowledge the Team members listed below for their contributions on this project and report. We are deeply indebted to Peter Thielen from Booz Allen Hamilton for helping the team to develop a graphic on how to spot dis/misinformation and bringing our vision to fruition and Hale Vallandingham for her assistance with graphics and formatting.

Team Members



Scope

This paper was produced by the Combatting Targeted Disinformation Campaigns team under the auspices of the Public-Private Analytic Exchange Program – an initiative of the Office of Director of National Intelligence and managed by the Department of Homeland Security. The paper was based on open-source research and interviews with subject matter experts. All judgments and assessments are based solely on unclassified sources, are the product of joint private sector and U.S. government efforts, and do not necessarily represent the judgments and assessments of the employers of the Team members.

Offensive and defensive cyber operations conducted by the U.S. government against foreign threat actors are beyond the scope of this paper.

Executive Summary

Recent events have demonstrated that targeted disinformation campaigns can have consequences that impact the lives and safety of information consumers. On social media platforms and in messaging apps, disinformation spread like a virus, infecting information consumers with contempt for democratic norms and intolerance of the views and actions of others. These events have highlighted the deep political and social divisions within the United States. Disinformation helped to ignite long-simmering anger, frustration, and resentment, resulting, at times, in acts of violence and other unlawful behavior.

All information consumers are vulnerable to being deceived by imposters, charlatans, hucksters, con men, and self-proclaimed experts. But ideological rigidity and intolerance of opposing views make information consumers especially vulnerable to such deception. In polarized environments, threat actors find ample opportunity to spread disinformation. Their voices are amplified by disgruntled audiences willing and sometimes eager to spread messages of discord.

Figure 1 Disinformation (obtained from Defense.Info).

In 2019, the Combatting Targeted Disinformation Campaigns team submitted the first of a two-part report on targeted disinformation campaigns.[1] In the first report, we provided

[1] 2019 Public-Private Analytic Exchange Program, Department of Homeland Security, *Combatting Targeted Disinformation Campaigns: A whole-of-society issue*, PDF file, October 2019, https://www.dhs.gov/sites/default/files/publications/ia/ia_combatting-targeted-disinformation-campaigns.pdf (Accessed August 24, 2021).

a broad overview of targeted disinformation campaigns, described how disinformation enters the information ecosystem, how threat actors exploit modern technology, and how information consumers wittingly or unwittingly contribute to the spread of disinformation. We then suggested ways to counter these campaigns. We concluded that, to combat these campaigns, a comprehensive solution involving many sectors of society and lines of efforts was required.

In our second paper, we expand on two themes explored in the first paper: 1) how to stem the supply of disinformation; and 2) how to reduce the demand for disinformation. In this paper, we recommend approaches that impact both supply and demand. None of these approaches are new; nor are they decisive by themselves. When combined and implemented consistently, the sum is greater than the parts.

Figure 2 Dilok Klaisataporn, Shutterstock.

Disinformation should not be viewed as a problem to be solved, but as a condition to be treated. There is no cure. However, preventative and alleviatory measures can be taken.

Recommendations

Source attribution	•Identification of sources of disinformation, when feasible. We believe that threat actors should not be permitted to hide behind the veil of anonymity and identifying them by name gives information consumers important information as they evaluate the truthfulness of the information.
Exposure of imposters	•Exposure of imposters who use false persona and fake credentials to dupe information consumers online. If possible, we believe that uncovering imposters should be done without revealing personally identifiable information about the person.
User control over content	•Greater control by information consumers over the sources of information that appear in their content feeds on social media platforms. We believe that giving information consumers greater control may help to limit the creation of echo chambers.
Fact checking	•Access to content alerts which identify information that is factually incorrect, fraudulent, misleading, or satirical. We believe that such alerts should be politically neutral and based on clear definitions of the categories used.
Psychology of disinformation	•Making information consumers aware of how they process online information and how their online activities facilitate disinformation campaigns will help them make better decisions regarding this information.
Media literacy	•Information consumers who understand how to evaluate the impact of social media and other modern forms of communication on their ability to assess the trustworthiness of information will be more resilient to disinformation.

1. Disinformation Campaigns Are National Security Threats

Disinformation campaigns are threats to national security because they have a corrosive impact on democratic institutions and civil society in the United States. A healthy democracy depends on well-informed citizens, the competition of ideas, and the willingness to compromise. Disinformation campaigns undermine all three.

Disinformation campaigns have contributed measurably to divisions within U.S. society. Threat actors take advantage of these divisions and harness the power of social media platforms to spread disinformation to large audiences. At times, these disinformation campaigns influence the real-world behavior of information consumers. For example, disinformation about the 2020 presidential elections impacted the lead-up to the events of January 6, 2021 in Washington, D.C. Furthermore, disinformation about the COVID-19 vaccination program has undermined efforts to curb the virus and its variants. Disinformation also weakens international alliances and undermines U.S. attempts to project soft power abroad.

Figure 3 Jimmy Margulies via AP (from ABC news).

Figure 4 Divided country (obtained from News Bharati).

The launch of Sputnik I in 1957 sent shockwaves through the U.S. government. Fearing that the Soviet Union was surpassing the United States in technological and military prowess, the U.S. government responded by investing heavily in human capital and the development of technology. Experts identified weaknesses in educational institutions from primary to graduate levels, insufficient investment in basic and applied research, and governmental bureaucracies ill-adapted to guide the changes deemed necessary to respond to the threat. Major sectors of society contributed to a whole-of-society response to the perceived threat. A similar response is needed today for disinformation campaigns. However, the divisions in our society hinder such a coordinated response.

> *Perhaps because the disinformation crisis has descended upon us so suddenly, and because it reinforces our increasing political polarization, we've tended to regard it as inevitable and unavoidable—a fact of digital life. But we do have options, and if we come together to exercise them, we could make a meaningful difference.*
>
> *Glenn Gerstell, former NSA General Counsel*

In Finland, information literacy forms part of the national curriculum for primary and secondary schools. In math courses, instructors show students how statistics can be manipulated for the purposes of misleading others. In art classes, students learn how images can be altered to change their meaning. In language classes, students are exposed to different ways words can be used to mislead. And finally, students learn in history classes about past propaganda campaigns.

In Malaysia, the Communication and Multimedia Ministry launched an information verification portal called "sebenarnya.my." The public can use this portal to request that the Ministry verify information found online.

Germany introduced the "Act to Improve Enforcement of the Law in Social Networks" in 2017. This bill requires social media companies with over two million users in Germany to enforce 21 statutes in the German criminal code related to hate speech on their platforms. Platforms must review and delete unlawful content within 24 hours of receiving a complaint or be fined up to 50 million EUR.

Efforts of other countries: Finland [2]; Malaysia[3]; Germany[4]

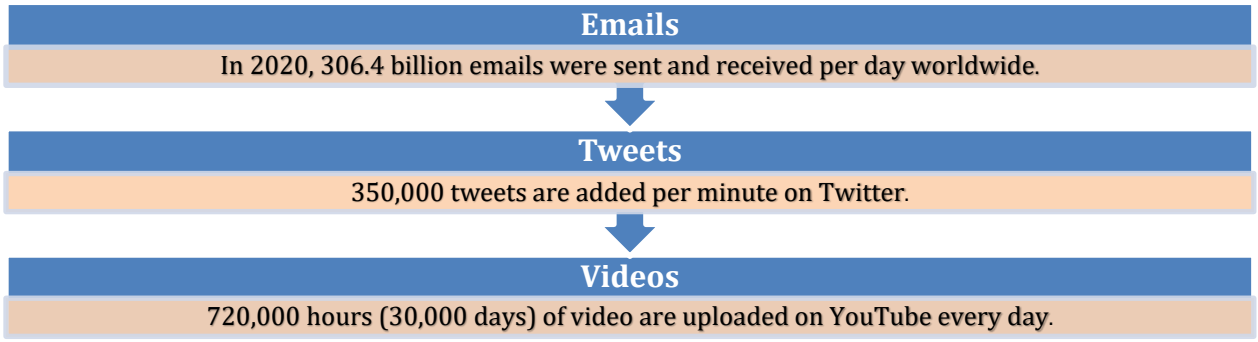
2. Reducing the Supply of Disinformation

Methods exist which can help slow, but not eliminate, the supply of disinformation. The challenge is breathtaking. The global information ecosystem enables the creation and distribution of information on an enormous scale.



The global dissemination of information: Emails; [5] Tweets;[6] YouTube.[7]

In this section, we conclude that technological and non-technological solutions exist that can reduce the likelihood that disinformation will course through the information ecosystem and negatively impact the target audience. These methods include source attribution, fact-checking, and greater user control over algorithms used by social media platforms.

[5]Joseph Johnson, "Number of sent and received e-mails per day worldwide from 2017 to 2025", last modified April 7, 2021, https://www.statista.com/statistics/456500/daily-number-of-e-mails-worldwide (accessed August 24, 2021).

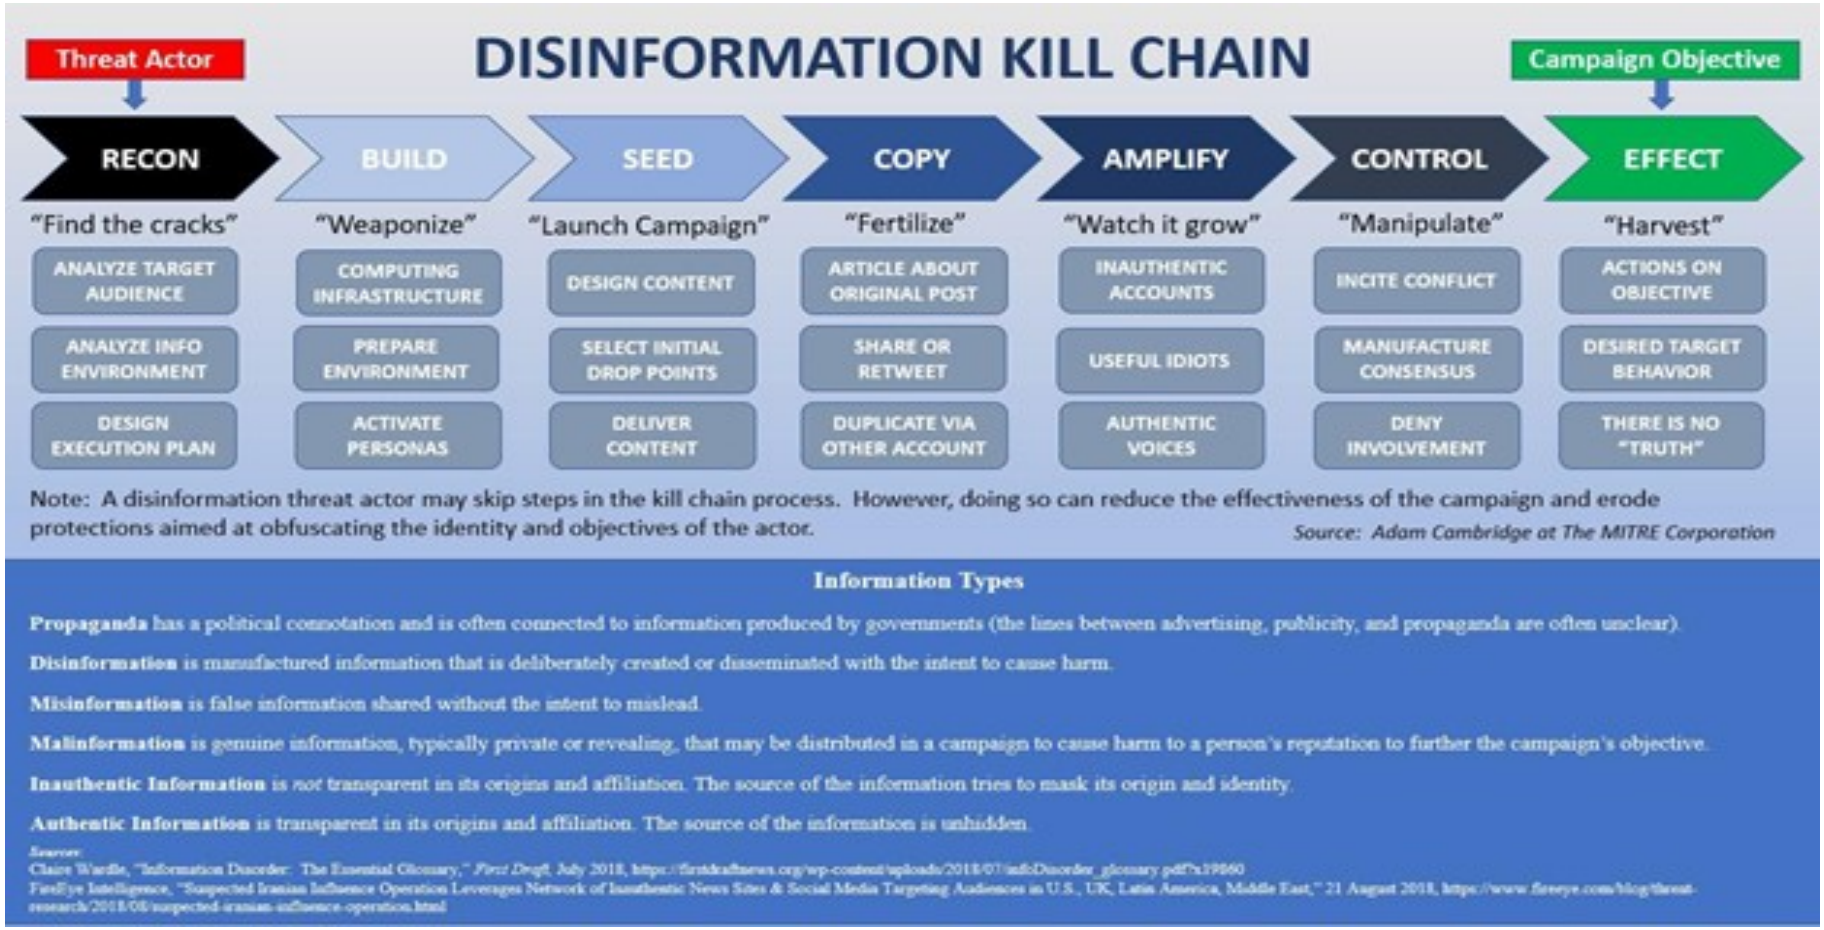

Figure 5 Source: The MITRE Corporation.

2.1. Source Attribution and Anonymity

Providing information about the threat actors responsible for disinformation campaigns can help slow the spread of disinformation since the source of information influences how information consumers evaluate the truthfulness of the information and the decision to later share the information. This method is called source attribution. Source attribution can be conducted in a manner that safeguards the constitutional and statutory rights of U.S. citizens to privacy and the freedom of speech.

In the United States, anonymity has long been considered a necessary component of the freedom of speech. However, anonymity on the Internet is a mixed bag. It not only promotes the discussion of sensitive topics, but also facilitates uncivil behavior and the spread of disinformation. In the next two sections, we consider source attribution of both foreign and domestic threat actors.

2.1.1. Identifying Foreign Actors

"Naming and shaming" is an approach to countering disinformation in which threat actors behind disinformation campaigns are publicly identified. When threat actors use fake personas to deceive, information consumers may decide to disregard the threat actor and the disinformation associated with that threat actor when the deception is uncovered. Once a threat actor is publicly identified, they will be shamed into altering course.

> Our deeply-felt national scruples about misidentifying a fake account or inadvertently silencing someone, however briefly, create a welcoming environment for malign groups who masquerade as Americans or who game algorithms….When tech platforms or regulators strive to take meaningful action to suppress abuse of their platforms and our American polity, there are waves of outrage over censorship. We have conversations about whether or not bots have the right to free speech, we respect the privacy of fake people..
>
> New Knowledge, ***The Tactics & Tropes of the Internet Research Agency***

Private companies have publicly attributed malicious cyber incidents to foreign state actors.[8] The benefits of doing so are usually short-lived since the threat actor will likely change tactics in response. These companies have stated several reasons for engaging in this activity, including supporting internal government discussions by allowing employees not possessing the appropriate security clearances to view information that would likely be classified if provided by the federal government, providing corroborating information for other information gathered by the federal government, and underscoring to the public the reach of the cyber incident.[9]

One method of disseminating this information is through source alerts. Researchers at Harvard University tested whether source alerts help to reduce the likelihood that

[8] Sasha Romanosky and Benjamin Boudreaux, "Private Sector Attribution of Cyber Incidents: Benefits and Risks to the U.S. Government", PDF file, Rand, January 2019, https://www.cs.dartmouth.edu/~ccpalmer/teaching/cs55/Resources/Papers/RAND_WR1267.pdf (accessed August 24, 2021).
[9] Ibid., 17-20.

information consumers will believe or share political messages. Limiting the study to foreign sources of information and two social media platforms (Twitter and Facebook), the researchers explored whether general ("foreign government") and specific ("Russian government") source alerts did have such an effect.[10] In assessing how the participants in the study viewed the truthfulness of the information, the researchers found that the effects were more significant for specific source alerts than for general ones. Exposure to specific source alerts reduced the probability that the participants would find the disinformation truthful. General and specific source alerts reduced the tendency to "like" or share the disinformation on Twitter only.

Figure 6 State-affiliated media account labels (obtained from Twitter)

FireEye, CrowdStrike, Dell SecureWorks, and Cisco Talos have publicly identified foreign threat actors.[11] In recent years, both Facebook and Twitter have increased the use of specific source alerts and have tied disinformation campaigns to foreign actors such as the Iran Broadcasting Company and the Royal Thai Military.[12]

[10] Jason Roos Arnold et al., "Source alerts can reduce the harms of foreign disinformation", PDF file, *Harvard Kennedy School Misinformation Review*, May 2021, https://misinforeview.hks.harvard.edu/wp-content/uploads/2021/05/arnold_source_alerts_foreign_disinformation_20210510.pdf (accessed August 24, 2021).

Developed by OpenAI, GPT-3 uses neural networks and machine learning to generate automated text in response to prompts from humans. These texts are difficult to differentiate from those written by humans.

Figure 7 OpenAI, GPT-3.

There are risks associated with source attribution. Such source attribution invites blowback from these threat actors and may undermine ongoing federal law enforcement, intelligence, and diplomatic efforts.

The evidence that such naming "shames" foreign actors into modifying their behavior is thin.[13] However, identifying specific foreign threat actors behind disinformation campaigns gives information consumers the opportunity to evaluate the information with this source attribution in mind and therefore we recommend such attribution when circumstances allow.

❖ Recommendation 1: Identify Foreign Sources of Disinformation

2.1.2. Identifying Domestic Actors

Since the 2016 U.S. presidential election and the emergence of the COVID-19 pandemic, the focus on disinformation campaigns has shifted from foreign

[13] Jack Snyder, "Backlash against naming and shaming: The politics of status and emotion", *The British Journal of Politics and International Relations* 22, no 4 (2020): 644-653.

threat actors to domestic ones.[14] On balance, disinformation campaigns originating from domestic actors are more enduring and damaging than those originating from foreign actors.[15] But, when domestic actors are involved, even if co-opted by foreign actors, the factors that bear on the decision to identify domestic actors differ in important ways from those that apply to foreign actors.

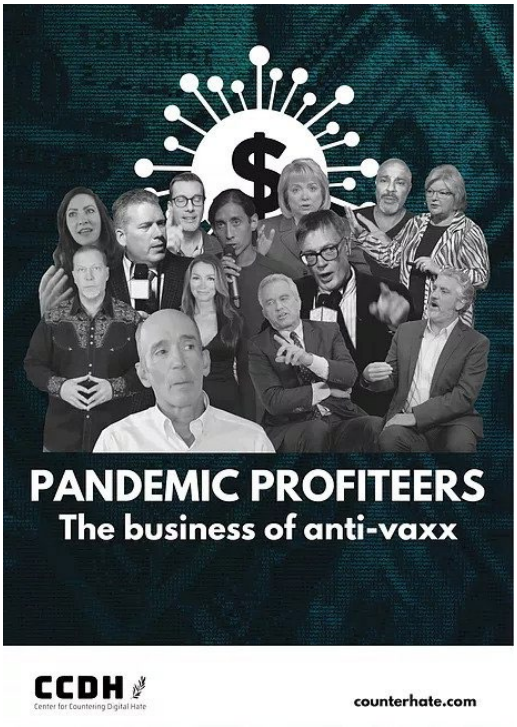

Figure 8 Pandemic Profiteers, Center for Countering Digital Hate.

Both private and public entities have legal obligations to protect information they collect about information consumers. This obligation depends on the type of information collected and how it was collected. Private entities generally have no legal obligation to protect information about information consumers with whom they have no fiduciary relationship, provided the information was gathered through licit means. Therefore, these private entities are free to publish this information when it suits their purpose. For example, in a report published in March 2021, the Center for Countering Digital Hate named twelve information consumers responsible for 73% of anti-COVID-19 vaccine content online.[16]

[14] Larry Luxner, "Ahead of the 2020 US elections, the disinformation threat is more domestic than foreign", Atlantic Council, last modified September 23, 2020, https://www.atlanticcouncil.org/blogs/new-atlanticist/ahead-of-the-2020-us-elections-the-disinformation-threat-is-more-domestic-than-foreign (accessed August 24, 2021).

[16] Center for Countering Digital Hate, "The Disinformation Dozen: Why Platforms Must Act on Twelve Leading Online Anti-Vaxxers", PDF file, March 24, 2021, https://252f2edd-1c8b-49f5-9bb2-cb57bb47e4ba.filesusr.com/ugd/f4d9b9_b7cedc0553604720b7137f8663366ee5.pdf. (accessed August 24, 2021).

The report included the name, photo, and screenshots of posts on Facebook and Twitter of each individual. The New York Times later published a more detailed article on the person listed in the report as the greatest offender.[17]

Whether the identification of domestic threat actors by private entities helps to stem the spread of disinformation is unclear. While naming and shaming may be superficially appealing as a method of exacting a price from those who peddle in disinformation, such naming and shaming might make matters worse by provoking a fierce backlash from those sympathetic to the views of the information consumers identified. In the end, this further entrenches both sides in their respective ideological positions.[18] Since polarization is a primary reason for the success of disinformation campaigns, attempting to counter these campaigns with methods which may generate even more polarization seems questionable. Also, revealing the identities of domestic threat actors and other personally identifiable information can render these information consumers vulnerable to harassment or more egregious forms of retaliation.[19] We do not condone harassment and vigilantism as means of responding to domestic threat actors.

Absent suspicion of criminal activity or a legitimate government purpose pursuant to clear legal authority, government monitoring of the opinions and activities of U.S. persons is problematic. Although federal and state law penalize false statements in judicial proceedings and official documents and information consumers may be liable for words

[17] Sheera Frankel, "The Most Influential Spreader of Coronavirus Misinformation Online", *N.Y. Times*, last modified July 24, 2021, https://www.nytimes.com/2021/07/24/technology/joseph-mercola-coronavirus-misinformation-online.html (accessed July 30, 2021).
[18] Ibid.

that incite violence, defraud, or defame, disinformation, much less misinformation, is not illegal in most cases.

2.1.3. Uncovering Imposters

An alternative to naming specific domestic threat actors is to alert information consumers to those threat actors who assume fake persona or claim to have credentials which they do not have. The status of the threat actor plays an important role in influencing the perceived trustworthiness of that threat actor.[20] Someone who claims to be an epidemiologist will likely be viewed as more reliable on the topic of coronaviruses than a person who claims to be a bus driver.

Information consumers who assume fake personas or claim fake credentials to deceive others for illegitimate purposes have no moral or legal standing for protection for their fraud, which is a form of disinformation. Revealing that credentials are fake can be accomplished without identifying the threat actor by name or by other information which can be tied to a specific person.

Figure 9 Fake identities, (obtained from Wonder How To).

[20] Edward L. Glaeser, "Measuring Trust", PDF file, *The Quarterly Journal of Economics*, (August 2000): 811-846. https://scholar.harvard.edu/files/laibson/files/measuring_trust.pdf (accessed August 24, 2021).

Threat actors who spread disinformation often seem to act with impunity, facing few negative consequences for the harm that they cause. In some circles, their disinformation may enhance their status and generate lucrative opportunities for them due to the attention that they draw. Legal actions against threat actors are available, but limited in number, and invariably costly and time-consuming. In a deeply divided society, shunning and ostracism no longer have the practical import they may have had in earlier generations. The lack of perceived consequences encourages threat actors to continue their activities. We acknowledge the challenges in today's environment and believe that punitive measures are less effective than measures which provide information about the threat actors upon which information consumers can make better informed decisions.

❖ Recommendation 2: Uncover Imposters

2.2. Social Media Algorithms & Fact-Checking

Challenging disinformation by fact-checking the information and making the results of this fact-checking publicly available is an important method of combatting disinformation campaigns. Disinformation which spreads unchecked through the information ecosystem will ultimately end up in the content feeds of social media platforms. Algorithms determine much of the content which ends up in these feeds. By allowing information consumers more control over these algorithms and the sources which these algorithms utilize, information consumers may have a greater ability to exclude known sources of disinformation.

Figure 10 Misinformation, (obtained from Agility PR Solutions).

2.2.1. Social Media Algorithms

Social media companies use algorithms to sort, index, prioritize, and sometimes suppress the content generated by users of their platforms. These companies can manipulate these algorithms to enhance the profitability of their platforms by attempting to keep users engaged on their platforms as much as possible through attention-grabbing features such as likes, comments, streaks, and recommended posts and people to follow. User activities are recorded, quantified, and used to tailor the user's experience while on the social media platform. On the one hand, algorithms simply give

the user more of what the user's activity on the platform seems to indicate the user wants. On the other hand, these same algorithms potentially create polarizing echo chambers by excluding contrary views.

In April 2021, the United States House of Representatives Subcommittee on Privacy, Technology, and the Law, a subcommittee of the Committee on the Judiciary, met to discuss the impact of algorithms.[21] Several panelists warned of the dangers of algorithms and broadly echoed the sentiments of others who claim that algorithms affect how we see the world[22], erode our ability to freely make choices[23], inherently create polarization[24], and create dangerous feedback loops[25]. The panelists offered solutions ranging from robust federal oversight to a new digital infrastructure which avoids the many problems created by social media platforms in their current forms.

Algorithms influence decision-making in many sectors of society from determining insurance rates to assessing the volatility of stock prices on Wall Street. Algorithms require data to function, which comes in the form of user input on social media platforms.

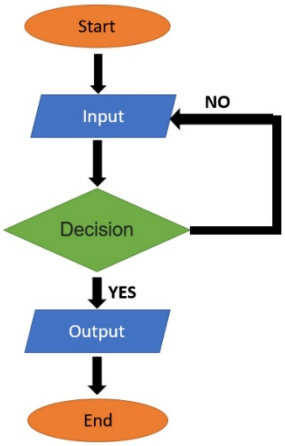
Input into algorithms helps to determine the output of these algorithms. Social media platforms ultimately determine what content the algorithms feed into the content streams of users. By providing control of the data that the algorithm uses, platforms may help to ensure users have control over their individual experiences on the platform. Regular reminders to review the information that the algorithms use and make adjustments, if necessary, can help keep users engaged in the process of determining the content that shows up in their content feeds.



❖ Recommendation 3: Grant Users More Control over Content Feeds

2.2.2. Fact-checking

In general, publishers of information have an ethical, legal, and fiduciary responsibility to ensure that they publish information that is accurate. When mistakes are uncovered, publishers can retract articles and posts, send amended versions, and publicly announce the course of action taken to remedy the situation. Notable exceptions are media sites whose content is for satirical purposes or entertainment shows that generate fake news for comic effect. Social media companies are not publishers in the traditional sense of the word. These companies provide platforms where users of these platforms can add content. The user-driven content on these

platforms does not imply that the social media companies endorse the content. While these companies usually grant users the ability to moderate content on the pages and groups formed by the users themselves, content is not first subject to pre-approval by the social media companies prior to posting.

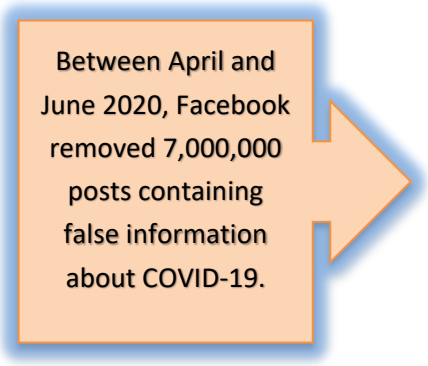


Figure 12 Reuters.

Social media companies arguably play an outsized role in providing access to news and providing a means to share news and other types of information. The power to determine what content is permissible on a social media platform and what is not is a power that social media companies should exercise with great discretion. These determinations should be made based on impartial and easily understood guidelines. Alerting users to the accuracy of information appearing in content feeds plays a useful role in encouraging users to make informed decisions.

Social media platforms, third-party entities, and users themselves can play a role in fact-checking information. If information is determined to be false, the information can be labeled as such, deleted, or supplemented by facts. To minimize the politicization of the process of removing or correcting disinformation, clear distinctions should be drawn between fact-checking, content moderation, and what constitutes improper censorship.

The goal of fact-checking is not to promote or suppress points of view, but to make sure that the information presented can be supported by verifiable information. We urge all fact-checkers to adhere to the principles identified below:

Figure 13 International Fact Checking Code of Principles, IFCN.

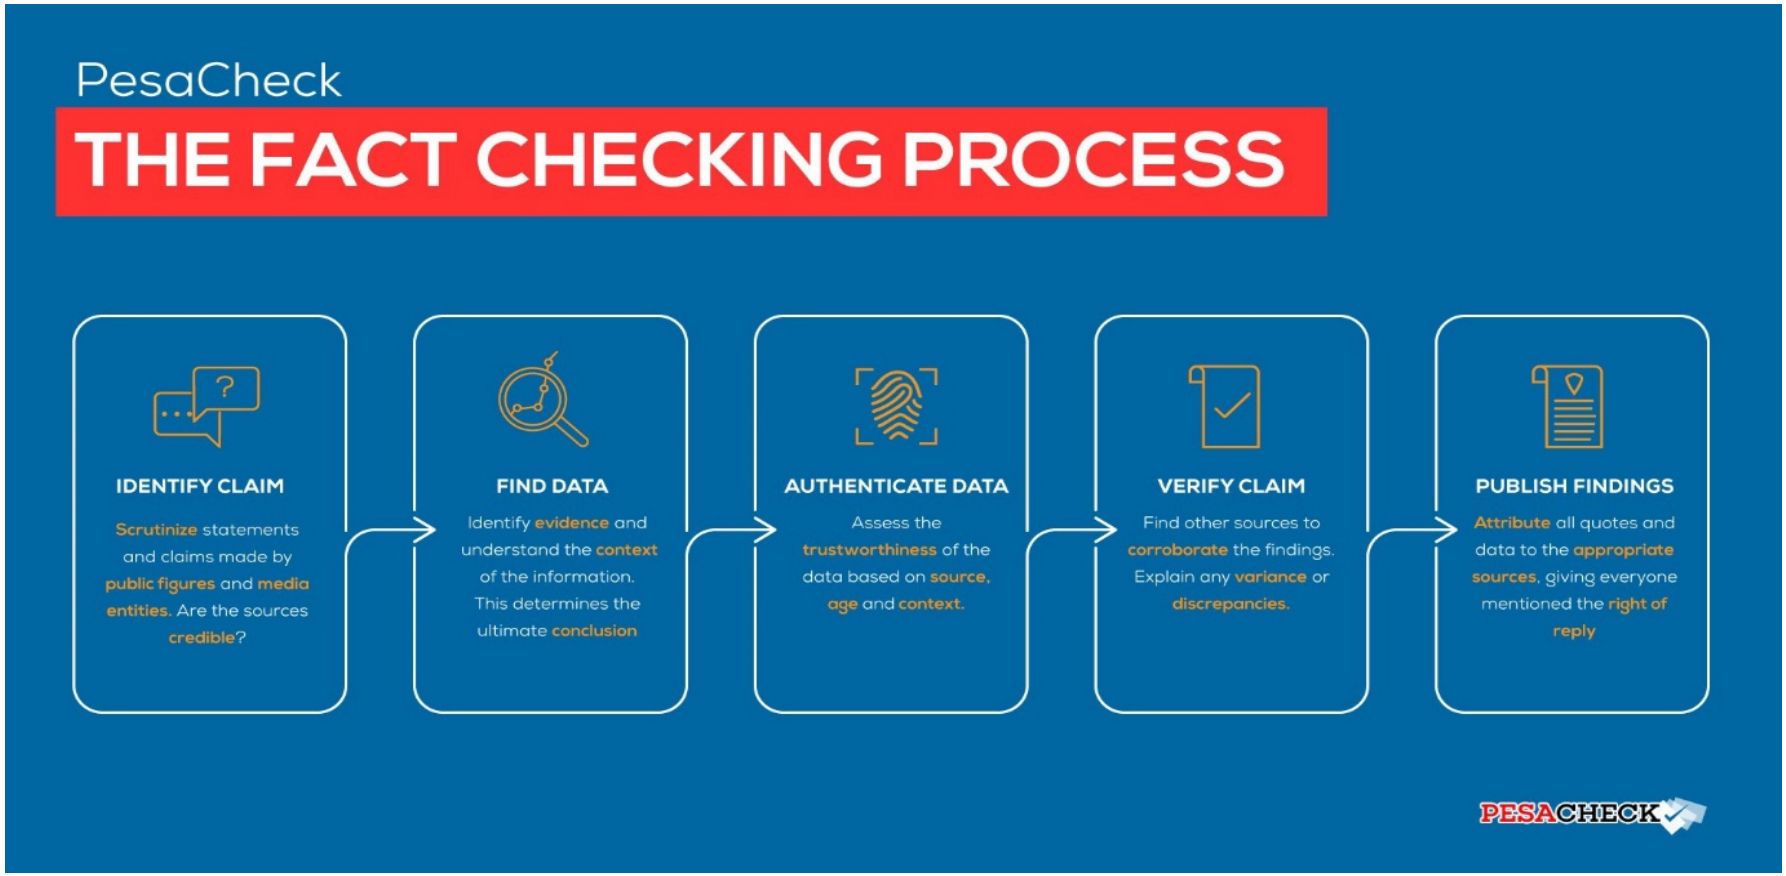

Figure 14 The Fact Checking Process, (obtained from PesaCheck).

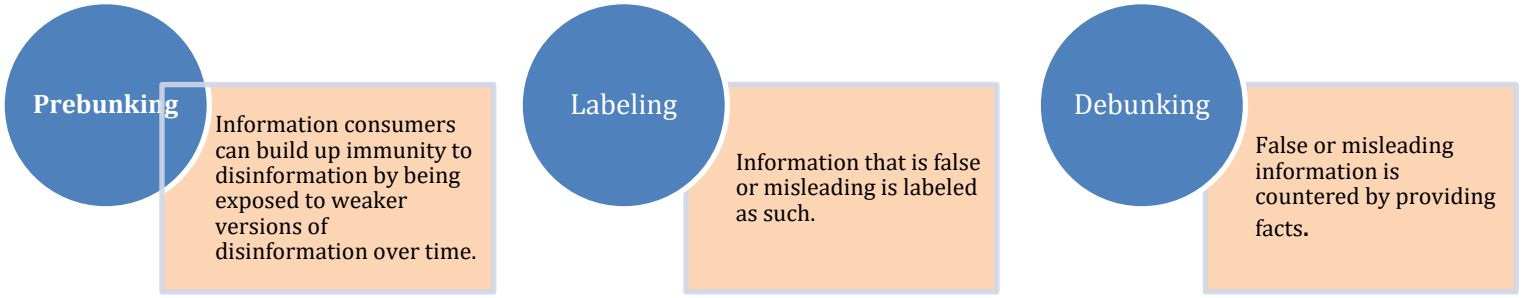
Page 321 of 3957

There are different methods of notifying readers that information has been fact-checked, but found to be unverifiable or false.



Researchers have found that the timing of fact-checks provided to readers makes a difference.[26] In one study, participants were exposed to 18 true headlines and 18 false headlines with true and false tags before (prebunking), during (labeling), and after (debunking) reading the headlines. The participants rated the accuracy of each headline. A week later, the participants were asked again to rate the accuracy of each headline. In comparison to prebunking and labeling, debunking had the greatest impact on their ability to discern the truthfulness of the headlines.

More research needs to be conducted into the efficacy of one method versus another, particularly on a longer time scale. However, having accurate information does not necessarily lead to a change in belief.[27] Some researchers maintain that the effect is

[26] Nadia M. Brashier et al., "Timing matters when correcting fake news", *PNAS* 118, no 5 (2021): e2020043118. https://doi.org/10.1073/pnas.2020043118 (accessed August 24, 2021).
[27] Oscar Barrera et al., "Facts, alternative facts, and fact checking in times of post-truth politics", *Journal of Public Economics* 182, (2020). https://doi.org/10.1016/j.jpubeco.2019.104123 (accessed August 24, 2021).

weak.[28] Overall, the impact of fact-checking alone is limited.[29] The ability to spread disinformation far outpaces the ability to fact-check. Therefore, fact checkers need to prioritize where they can best employ their resources. We conclude that challenging misinformation and disinformation online is preferable to allowing both to flow unchecked.

❖ Recommendation 4: Increase Fact-Checking Efforts

3. The Demand for Disinformation

Disinformation campaigns wreak havoc because information consumers consume the disinformation, share it with others, and act upon it. For a variety of psychological and social reasons, information consumers are tempted to believe disinformation without weighing whether the disinformation is supported by evidence or sound reasoning.

> *A cognitive bias is a systemic error in thinking that occurs when people are processing and interpreting information in the world around them and affects the decisions and judgments that they make.*
>
> *Kendra Cherry*

Understanding the influence of cognitive biases and why information consumers make different choices about what to believe and share

[28] Nathan Walter, et. al., "Fact-checking: A Meta-Analysis of What Works and for Whom", *Political Communication* 37, no 3 (2020): 350-375, DOI: 10.1080/10584609.2019.1668894 (accessed August 24, 2021).
[29] Andrew Tompkins, "Is fact-checking effective? A critical review of what works – and what doesn't", *DW AKADEMIE*, last modified December 10, 2020, https://www.dw.com/en/is-fact-checking-effective-a-critical-review-of-what-works-and-what-doesnt/a-55248257 (accessed August 2, 2021).

with others can help make them more resilient to threat actors who exploit the way information consumers think and interact with one another.

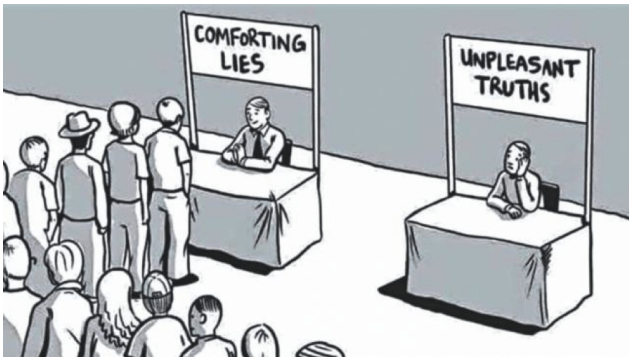


Figure 15 Comforting Lies vs. Unpleasant Truths (obtained from News Literacy Matters).

Threat actors are not alone in attempting to use the lessons of cognitive science and group psychology to their advantage. Governments, religious authorities, and retail advertisers have long taken advantage of psychological and social characteristics of information consumers to induce conformity, sell products, discourage harmful health habits, and otherwise steer thinking and behavior in a desired direction. Information consumers use reverse psychology or play on known weaknesses of others to achieve certain aims. Information consumers are not always aware of these efforts to manipulate them.

The information ecosystem has a profound impact on how we view the world. An information ecosystem contaminated by disinformation can influence people to think, feel, and behave in ways not informed by evidence, but by the duplicity of determined threat actors.

> An environment is, after all, a complex message system which imposes on human beings certain ways of thinking, feeling, and behaving. It structures what we can see and say and, therefore, do. It assigns roles to us and insists on our playing them. It specifies what we are permitted to do and what we are not.
>
> Neil Postman

In this section, we conclude that information consumers can become more resilient to disinformation online by understanding how their brains process information, improving

their ability to think critically, and becoming aware of how their online activity can facilitate the spread of disinformation.

3.1. Cognitive Bias

The mechanisms by which human brains process information make information consumers vulnerable to disinformation. For the human brain to process the enormous amounts of sensory input it receives; the brain has evolved mental shortcuts or "cognitive biases". However, these cognitive biases can undermine the ability to identify relevant facts, weigh the relevance of these facts, and form coherent courses of action based on these facts. Confirmation bias, belief bias, and the bandwagon effect are cognitive biases that are particularly relevant to understanding disinformation campaigns.

Confirmation bias

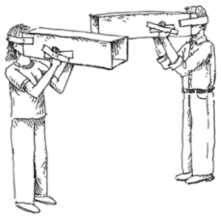

Figure 16 Tunnel Vision (obtained from Aftercare.com).

Information consumers who rely primarily on sources of information that conform to their ideological preferences are particularly vulnerable to disinformation. The design of online search engines, social media platforms, and smartphone applications, plus the availability of cable news programming catering to specific audiences, make it easy to screen information consumers from viewpoints that conflict with their ideological preferences.[30]

[30] Silvia Knobloch-Westwick and Steven B. Kleinman, "Preelection Selection Exposure: Confirmation Bias Versus Informational Utility", *Communication Research* 39, no. 2 (2012): 170-193. https://doi.org/10.1177%2F0093650211400597 (accessed August 24, 2021).

Belief bias

Figure 17 See hear speak no evil cartoon (obtained from VectorStock).

Information consumers tend to favor data and arguments which support their predetermined conclusions and view more harshly data and arguments which do not. While researching the spread of disinformation prior to the 2016 presidential election, researchers determined that whether a news item was accepted as true or rejected as false by information consumers strongly depended on how much it conformed to their belief system.[31]

Bandwagon effect

Figure 18 Blind Leading the Blind (obtained from Conversion Uplift).

Information consumers tend to adopt the beliefs that other people in their political and social networks have. Research has shown that exposure to pre-election polls increases the likelihood that voters will side with majority opinions.[32]

Cognitive biases facilitate analytical errors, lapses in judgment, faulty conclusions, hasty generalizations, and other defects in sound reasoning. Since cognitive biases are features of the human brain, learning how to minimize their impact by developing critical things skills is essential to building resilience to disinformation.[33]

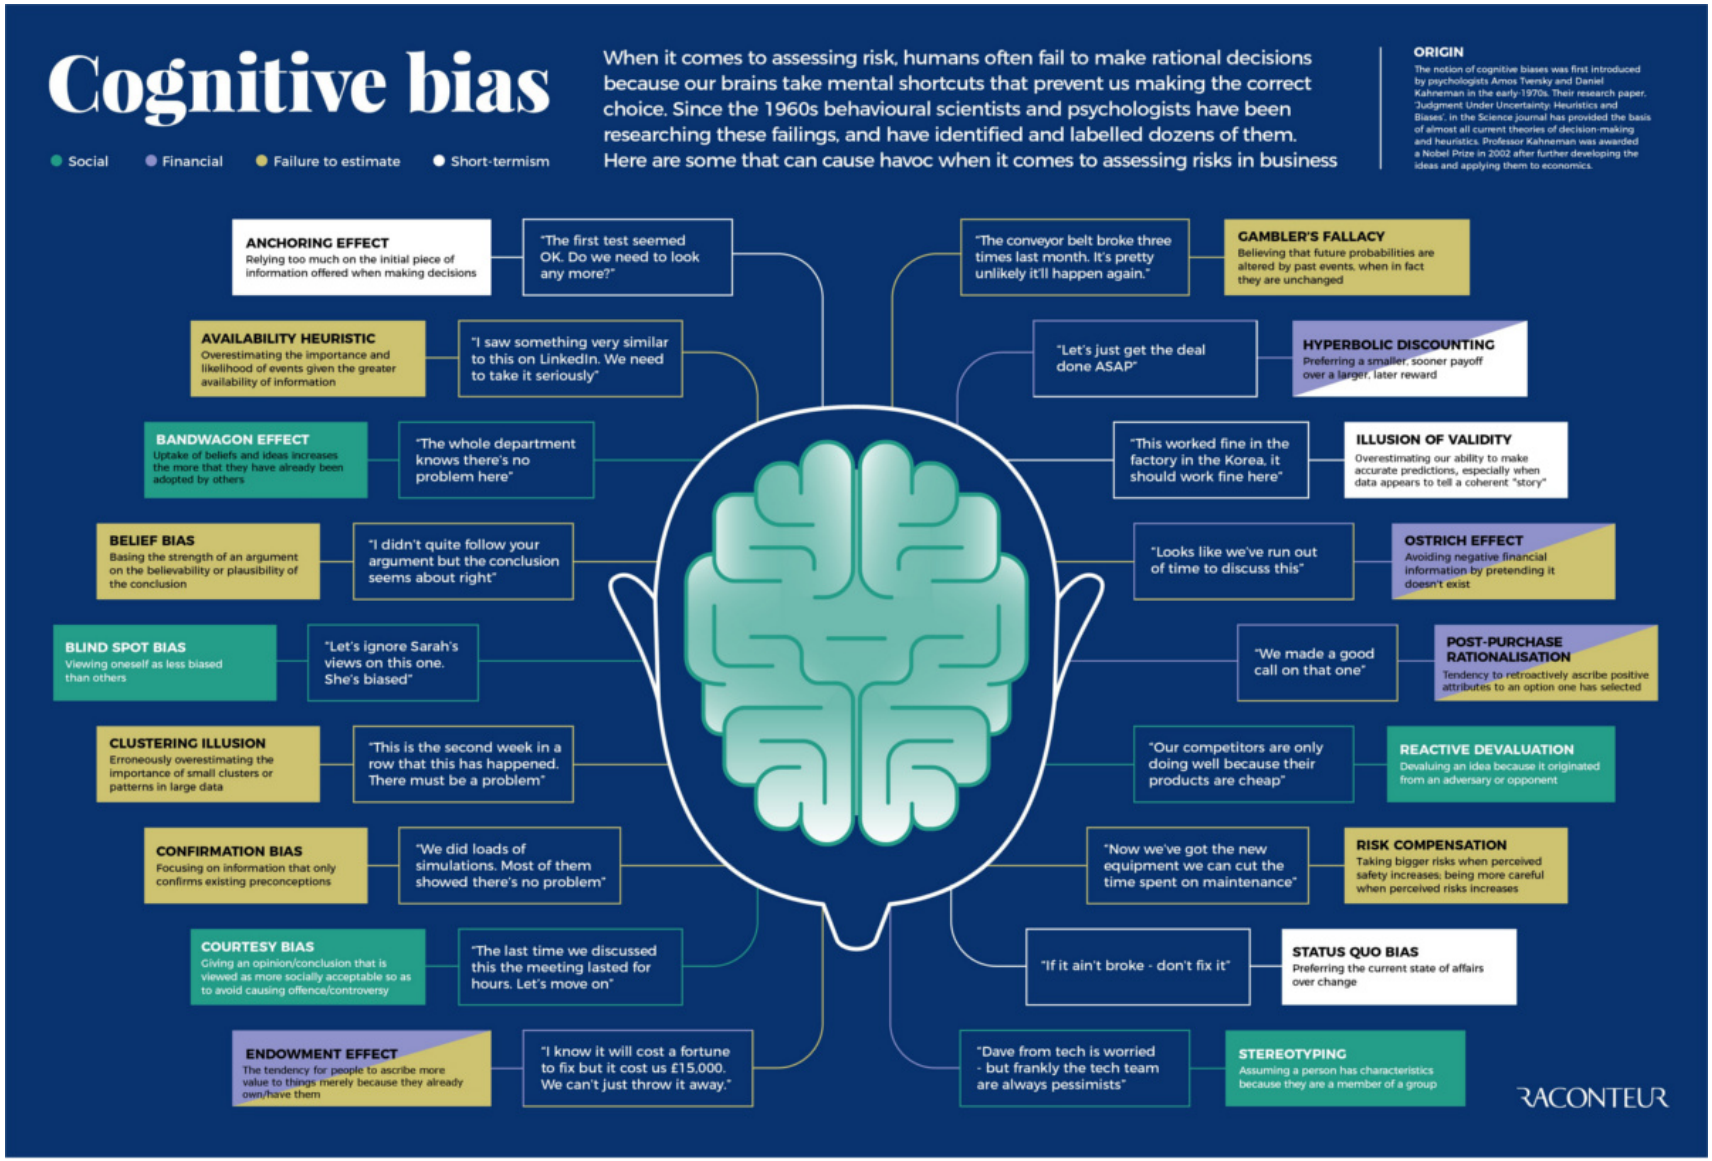

Figure 19 Cognitive Bias, Raconteur.

3.2. Emotional reactions to disinformation

Strong emotions influence the ability of information consumers to process information. Information that elicits strong emotions can overwhelm an individual's ability to think rationally and make prudent decisions. Strong emotions fuel "outrage culture" and lend their force to the incessant volleys of mutual recriminations which are commonplace on social media platforms. Threat actors start disinformation campaigns not to inform, but to agitate, provoke, incite, and inflame. By doing so, they render their audiences more receptive to the disinformation they wish to promote.

Figure 20 Angry Comments on Social Media (obtained from ISM Works).

The belief in the truthfulness of fake news is largely dependent on whether the information consumer relies primarily on reason or emotion to assess the information.[34] The more the information consumer relies on emotion, the more likely the information consumer is to believe in the fake news. Additionally, information consumers are more likely to share information if that information provokes emotional reactions.[35] Researchers determined that the ability to attract an information consumer's attention is key to whether the information consumer will later share this information. Information that does not elicit strong emotions is less

[34] Cameron Martel, Gordon Pennycock, and David G. Rand, "Reliance on emotion promotes belief in fake news", *Cognitive Research: Principles and Implications*. 5:47 (2020). https://doi.org/10.1186/s41235-020-00252-3 (accessed August 24, 2021).

[35] William J. Brady et al., "Emotion shapes the diffusion of moralized content in social networks", *PNAS* 114, no. 28 (2017): 7313-7318. Doi: 10.1073/pnas.1618923114 (accessed August 24, 2021).

likely to attract the attention of information consumers and therefore less likely to be shared.

The circumvention of thoughtful deliberation before acting, rather than the presence of strong emotions, is the key issue. Information consumers often make poor decisions in the heat of the moment, and when blinded by outrage or the desire for revenge. When information consumers encounter information online which elicits such reactions, these feelings should give the individual pause.

3.3. The Psychology Behind Sharing Information Online

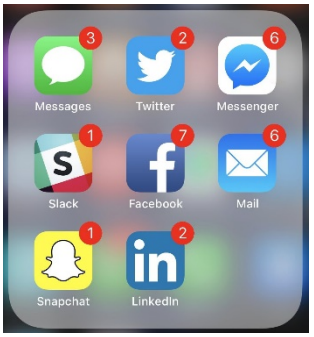
Information consumers who share disinformation help sustain disinformation campaigns and contribute to the rapid spread of disinformation through the information ecosystem. Research suggests that relatively few people intentionally share disinformation on social media.[36] Three main factors that drive the decision to share disinformation are consistency, consensus, and authority.[37] First, the disinformation is consistent with the beliefs that the information consumers already possess. Second, the information consumer believes that most people in his or her social group believe the disinformation. Third, the information consumer believes that the disinformation derives from an authoritative source.

[36] Tom Buchanon, "Why Do People Share Disinformation on Social Media?", PDF file, *Policy Brief*, September 2020, https://crestresearch.ac.uk/download/3040/20-017-03-disinformation-on-social-media.pdf (accessed August 24, 2021).

[37] Tom Buchanon, "Why Do People Spread Disinformation Online: The effects of message and viewer characteristics on self-reported likelihood of sharing social media disinformation", *PLoS ONE* 15, no 10 (2020): e0239666. https://doi.org/10.1371/journal.pone.0239666 (accessed August 24, 2021).

Figure 21 Eric Allie/Cagle Cartoons.

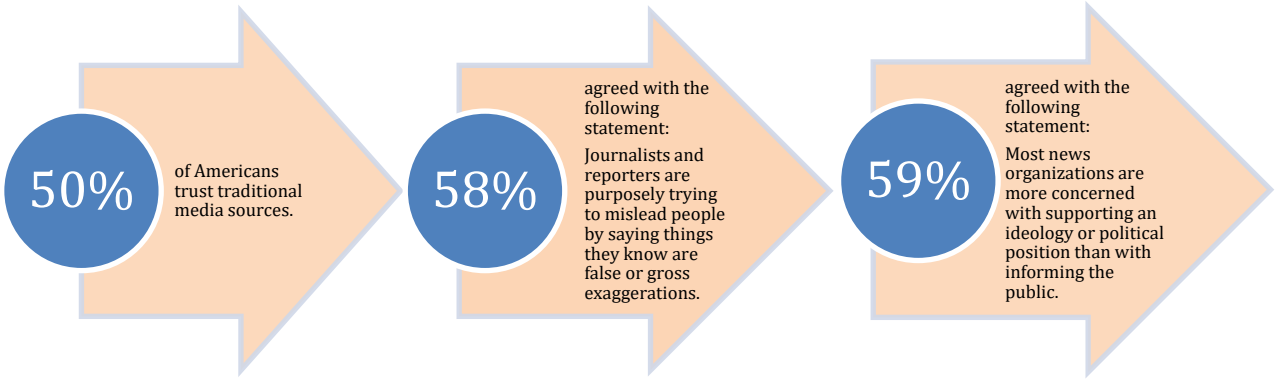
Other factors also play a role in the decision to share disinformation. Information consumers may share disinformation on social media platforms to demonstrate allegiance to a particular idea (similar to virtue signaling), to share novel information, or to draw attention to themselves to increase 'likes', 'views', or 'followers'. Political partisanship motivates information consumers to share disinformation when this disinformation can be used to counter the arguments of political opponents.[38]



Social media platforms have features that incentivize information consumers to share information. These features often have addictive qualities that make it difficult for information consumers to resist the temptation to share information, including disinformation, or to disengage from the platform entirely. Before sharing information online, we encourage information consumers to critically examine the information they wish to share and the motives they have for sharing it. Disinformation at rest is far less effective than disinformation in motion.

[38] Mathias Osmundsen et al, "Partisan Polarization is the Primary Psychological Motivation behind Political Fake News Sharing on Twitter," *American Political Science Review* 115, no 3, (2021): 1-17.

❖ **Recommendation 5: Teach Information Consumers about the cognitive and emotional impact of social media and online information**



Edelman Trust Barometer 2021.

4. Media Literacy and Critical Thinking Skills

Media literacy is the application of critical thinking skills to forms of information, whether print newspapers and magazines, along with their online counterparts, broadcasts on television and radio, online video or podcasts, and on social media platforms or messaging apps. Media literacy efforts typically involve training information consumers how to differentiate fact from opinion, how to assess sources of information, and how information can be manipulated to deceive the audience. Research suggests

that media literacy efforts can assist information consumers to distinguish real news from fake news.[39]

Other approaches include helping information consumers understand the cognitive and mental health impact of using social media and other digital sources of information and helping them negotiate the many hazards found online.[40] One researcher maintains that media literacy efforts should encompass not only traditional forms of media, but also the information that passes through their networks of online connections.[41] Using this approach, information consumers can more clearly appreciate their own roles in the dissemination of disinformation. An article, video, podcast, or photograph shared, a retweet, a like, a comment, a post to a listserv, all may have more impact than an individual might foresee.

[40] Amy Callahan, "Media Literacy Isn't Coming to Save Us (But We Can Make It Better)", *EdW*, last modified January 23, 2019, https://www.edweek.org/teaching-learning/opinion-media-literacy-isnt-coming-to-save-us-but-we-can-make-it-better/2019/01 (accessed August 24, 2021).
[41] Dana Boyd, "You Think You Want Media Literacy…Do You?," *Points: Data & Society*, last modified March 9, 2018, https://points.datasociety.net/you-think-you-want-media-literacy-do-you-7cad6af18ec2 (accessed August 24, 2021).

Educational institutions and non-governmental organizations provide resources on media literacy for use in formal and information educational settings, and self-paced learning. In 2019, the Digital Citizenship and Media Literacy Act was introduced in the U.S. Senate to assist with nationwide efforts, including the study of best practices in media literacy programs.[42]

Research indicates that many information consumers are not able to articulate the criteria by which they evaluate the trustworthiness of information and therefore are unable consistently to distinguish real news from fake news.[43] The development of critical thinking skills can help information consumers recognize faulty reasoning, weakly-

Figure 23 Critical Thinking Diagram (obtained from Tycoonstory).

[42] A Bill to promote digital citizenship and media literacy, S. 2240, 116th Congress, 1st Session. (2019).
[43] Blanca Puig, Paloma Blanco-Anaya, and Jorge J. Pérez-Maciera, "'Fake News' or Real Science? Critical Thinking to Assess Information on COVID-19", *Frontiers in Education*, last modified May 3, 2021, https://www.frontiersin.org/articles/10.3389/feduc.2021.646909/full (accessed August 24, 2021).

supported arguments, and disinformation. Teaching critical thinking skills as a separate course, as well as incorporating the application of critical thinking in all courses, leads to better outcomes than not providing a course focused exclusively on the teaching of critical thinking skills.[44] We encourage the development of critical thinking skills in both formal and informal educational settings.

❖ Recommendation 6: Teach Media Literacy and Critical Thinking Skills

We also suggest information consumers to utilize the SMART mnemonic and practices. Based on Aesop's The Tortoise and the Hare, the SMART graphic on the next page illustrates the need to take time to reflect on information to verify its truthfulness before dissemination to others. Proceeding slowly, but prudently, before acting on information is preferable to proceeding rapidly, but carelessly. The tortoise bypasses the hurdles that impede the search for the facts. Meanwhile, the hare falls headlong into the traps set by those who promote disinformation.

[44] Shane Horn and Koen Veermans, "Critical Thinking efficacy and transfer skills defend against 'fake news' at an international school in Finland," *Journal of Research in International Education*, 18, no. 1 (2019): 23-41. https://doi.org/10.1177%2F1475240919830003 (accessed August 24, 2021).

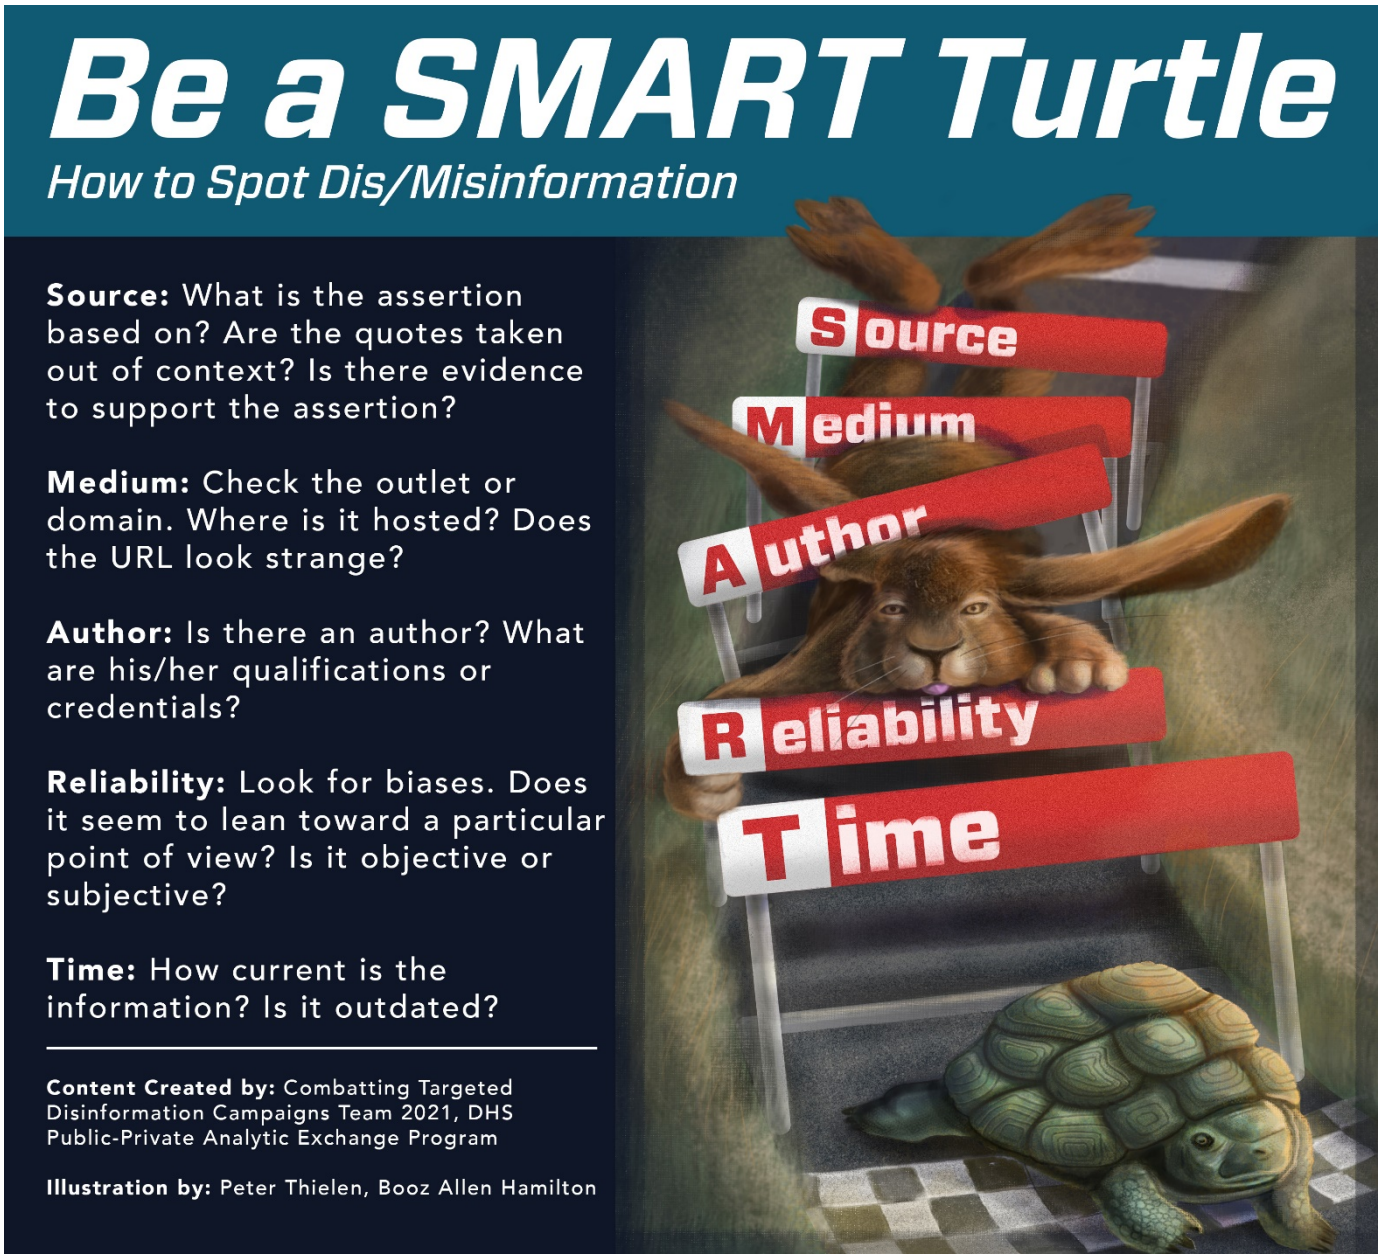

Figure 24 SMART Graphic | Source: Combatting Targeted Disinformation Campaigns Team 2021

Conclusion

It is extremely improbable that disinformation campaigns will disappear in the foreseeable future. Despite the increasing effectiveness of countermeasures, threat actors will always find avenues to spread their disinformation and will adopt new tactics as new forms of technology emerge. Compared to many legitimate forms of persuasion and influence, disinformation campaigns are inexpensive and frequently have few downsides for the threat actor. Threat actors take ready advantage of software and communication platforms that they did not develop and benefit from political and social conditions that they did not create.

In this report, we concluded that disinformation campaigns are threats to national security because they undermine the well-being of our society. Though disinformation campaigns cannot be stopped fully, we believe that measures can be taken to impede these campaigns and reduce their impact. We believe that building the resilience of information consumers to disinformation will likely bear more fruit than focusing on technological solutions. To build such resilience, we believe that giving information consumers more tools with which they can verify the information they consume online, identify the threat actors behind disinformation campaigns, verify the claims of imposters hiding behind fake persona and credentials, and control their content feeds is essential.

The factors which make information consumers vulnerable to disinformation are rooted in human psychology, the divisions within our society, and the siloed nature of today's information ecosystem. As illustrated in the Disinformation Kill Chain, one result of

disinformation campaigns is that information consumers end up believing that truth no longer exists. Such a result demonstrates that supply and demand form a positive feedback loop. When information consumers lose the ability to distinguish fact from fiction, and become uninterested in doing so, demand for disinformation grows, which drives the supply of disinformation.

The prevalence of disinformation campaigns in our society is emblematic of the polarization of our society. Such polarization hampers a united response and even the ability to come to a common understanding of what a fact is, and what disinformation or misinformation are. Individual information consumers can build up their immunity to disinformation. But our society, as a whole, will not be able to build up its resilience until the larger problems that recent events have exposed are dealt with first.

RAND ARROYO CENTER

Recent events in Crimea and the Donbass in eastern Ukraine have upended relations between Russia and the West, specifically the North Atlantic Treaty Organization (NATO) and the European Union (EU). Although Russia's actions in Ukraine were, for the most part, acts of outright aggression, Russia has been aiming to destabilize both its "near abroad"—the former Soviet states except for the Baltics—and wider Europe through the use of ambiguous "gray zone" tactics. These tactics include everything from propaganda and disinformation to election interference and the incitement of violence.

To better understand where there are vulnerabilities to Russian gray zone tactics in Europe and how to effectively counter them, the RAND Corporation ran a series of war games. These games comprised a Russian (Red) team, which was tasked with expanding its influence and undermining NATO unity, competing against a European (Green) team and a U.S. (Blue) team, which were aiming to defend their allies from Red's gray zone activities without provoking an outright war. In these games, the authors of this report observed patterns of behavior from the three teams that are broadly consistent with what has been observed in the real world. This report presents key insights from these games and from the research effort that informed them.

Preface

This report documents research and analysis conducted as part of a project entitled *Gray Zone War Games*, sponsored by the Office of the Deputy Chief of Staff, G-3/5/7, U.S. Army. The purpose of the project was to develop an interrelated series of expert input, tabletop, and computer-assisted war games to simulate "gray zone" activities, or measures short of war, to support analysis of strategic and operational threats and opportunities, to inform indications and warning processes, and to support U.S., UK, and other NATO strategies and force development plans.

This research was conducted within RAND Arroyo Center's Strategy, Doctrine, and Resources Program. RAND Arroyo Center, part of the RAND Corporation, is a federally funded research and development center sponsored by the United States Army.

RAND operates under a "Federal-Wide Assurance" (FWA00003425) and complies with the *Code of Federal Regulations for the Protection of Human Subjects Under United States Law* (45 CFR 46), also known as "the Common Rule," as well as with the implementation guidance set forth in DoD Instruction 3216.02. As applicable, this compliance includes reviews and approvals by RAND's Institutional Review Board (the Human Subjects Protection Committee) and by the U.S. Army. The views of sources utilized in this study are solely their own and do not represent the official policy or position of DoD or the U.S. Government.

Summary

Russia's 2014 offensives in the disputed regions of Crimea and the Donbass in Ukraine present a different challenge—an undeclared form of warfare that relied on a mixture of conventional and unconventional tools—from the one that the North Atlantic Treaty Organization (NATO) had prepared for during the Cold War. There have been many terms used to describe these unconventional Russian campaigns, including "gray zone conflict." This study was tasked with examining the "gray zone" in Europe, which is the expression we will use. We define gray zone tactics as *ambiguous* political, economic, informational, or military actions that primarily target domestic or international public opinion and are employed to advance a *revisionist* nation's interests without provoking outright war.

To better understand where there are vulnerabilities to these types of tactics and how to effectively counter them, we ran a series of war games to explore the issue of Russian gray zone aggression in Europe. These games comprised a Russian (Red) team, which was tasked with expanding its influence and undermining NATO unity, competing against a European (Green) team and a U.S. (Blue) team, which were aiming to defend their allies from Red's gray zone activities without provoking an outright war. In our games, we observed patterns of behavior from the three teams that are broadly consistent with what we have observed in the real world. This report presents the following key insights from these games and from the research effort that informed them:

Page 350 of 3957

- "Everyday" gray zone actions must be differentiated from more aggressive and focused gray zone actions. There are two variables, the target of the action and whether it involves outright violence or the threat of violence, that are important for understanding Russian gray zone tactics, because they imply different time horizons, objectives, and stakes. Many of the unconventional tactics that Russia uses to try to gain influence are routine, diffuse, and long-term, although others have very specific, short-term objectives. Russian gray zone tactics might also be nonviolent (e.g., propaganda and disinformation) or involve outright violence or the threat of violence (e.g., a planned coup in Montenegro).
- Based on the war games conducted to support this project, we observed that NATO and the European Union (EU) are unlikely to be able to compel Russia to stop using nonviolent Russian gray zone tactics, but they might be able to deter high-order aggression. There is much talk about "deterring" Russian gray zone aggression, but many of these discussions are based on a misunderstanding of the concept. Because Russia is already engaging in steady-state gray zone actions, NATO and the EU need to compel Russia to stop these activities, which is a much harder task than deterrence. Moreover, the characteristics of everyday gray zone tactics—they are largely nonmilitary, usually gradual, and difficult to decisively attribute—lower the stakes and make it difficult for the West to credibly threaten to punish Russia, even if the actions are conclusively traced back to Moscow. Outright Russian aggression with the aim of territorial expansion is an entirely different situation, and one that can be deterred by conventional means.
- Vulnerability to Russian gray zone tactics varies significantly across Europe. Russia's "near abroad"—defined as the countries around its border—is the most vulnerable region, followed by the Balkans. This is largely because of those countries' weak governmental institutions and historic, cultural, and linguistic ties to Russia. By contrast, the Baltic states are less susceptible to gray zone tactics because of their relatively good governance. Finally,

Western and Central Europe are least vulnerable to Russian gray zone actions.

- Civil organizations, rather than militaries, might be best positioned to counter Russian gray zone tactics. The vast majority of Russian gray zone tactics are not geared toward territorial gains, but instead are routine actions that seek to enhance Russia's influence through nonmilitary means. In short, this is primarily a social, political, and economic fight, not a military one, that is better waged by civilian agencies and nongovernmental organizations whose core competencies lay in these domains. The military plays an important but limited role in countering Russian gray zone activities by improving cyber defenses, enhancing intelligence and counterintelligence capabilities, and building partner special forces capacity.
- Our research suggests that the West is winning this competition but does not recognize it. Some seem to believe that, because the West cannot stop Russia from using everyday gray zone activities, it is therefore somehow losing, but this neglects the larger strategic situation. Russia's gray zone tactics will persist and should be countered by hardening Western societies against propaganda and attempts to undermine democracy. However, overreaction only serves Moscow's purposes. Strong civil societies and robust democratic institutions, rather than panic at "losing" or attempts to fight Russia blow-by-blow, are the West's best defenses against Russia's gray zone tactics. Russia's gray zone tactics signify its weakness, and the West's stronger political, cultural, and social systems will prevail over them if given the chance.

Acknowledgments

The authors would like to thank MG William Hix for the opportunity to examine an important question and MAJ Robert Kurtts for his guidance of the project. Our report was strengthened by reviews from Dara Massicot of the RAND Corporation and Michael Kofman of CNA, and we thank them for their helpful comments. We also thank the Latvian Ministry of Defense, Latvian President's Office, NATO Stratcom Centre of Excellence, Centre for East European Policy Studies, International Centre for Defence and Security, Estonian Ministry of Foreign Affairs, and Estonian National Security and Defence Coordination Unit for sharing with us their views of Russian gray zone tactics and European countermeasures.

At RAND, we thank our colleagues Jenny Oberholtzer, William Mackenzie, Stephanie Pezard, David Frelinger, David Shlapak, and Ben Connable for helping to develop and run the games, and Sally Sleeper and Jennifer Kavanagh for their guidance of the project. We also thank the players in the multiple games that we conducted at RAND for their participation and valuable insights.

CHAPTER ONE

Introduction

In 2014, Russia's bloodless annexation of the Crimean Peninsula and its support of a separatist uprising in eastern Ukraine shattered the notion that Europe was peaceful and secure. It became clear that Russian President Vladimir Putin would use force to maintain Russia's influence in its "near abroad"—the former Soviet states except the Baltics—to undermine the North Atlantic Treaty Organization (NATO), divide Europe, and reduce U.S. dominance of the international order. Consequently, for the first time in several decades, NATO began to seriously grapple with how to deter and defeat aggression in its backyard. However, Russia's 2014 offensives seemed to present a different challenge—a covert form of warfare that relied on a mixture of conventional and unconventional tools—from the one that NATO had prepared for during the Cold War, one which the alliance was ill-prepared to counter. The Russian government did not officially acknowledge its offensives in Ukraine, which were characterized by the use of proxies, unmarked forces, disinformation, and cyberattacks, along with the use of conventional military forces. Together, these tactics were intended to create confusion and delay a response, allowing enough time for Russia to achieve its objective, thereby forcing its opponents to escalate the situation and mount an offensive to regain the lost territory. These tactics succeeded in paralyzing the Ukrainian government and multilateral European institutions during the Crimea operation, but did not achieve a commensurate level of success in eastern Ukraine because separatist operations in the Donbass (commonly defined as the Luhansk and Donetsk regions of Ukraine) were bogged down in a

Page 358 of 3957

Page 359 of 3957

bloody, inconclusive conflict with the Ukranian government. Although Russian conventional forces played decisive roles in both operations, many observers have focused on the unconventional tools that Russia used to mask the true nature of its actions and to bolster their efficacy. Russia has employed similar techniques—in particular the use of cyberattacks, propaganda, proxy forces, and disinformation—to try to create strife or to influence elections in Western democracies.

There have been many terms used to describe these unconventional Russian actions, including "gray zone conflict," "hybrid warfare," "nonlinear warfare," "ambiguous warfare," "indirect action," "asymmetric," and "political warfare."[1] We are not going to delve into the debates about the coherence or utility of these various terms.[2] Rather, this study was tasked with examining the gray zone in Europe,

which is the expression that we will use. We define *gray zone tactics* as ambiguous political, economic, informational, or military actions that primarily target domestic or international public opinion and are employed to advance a nation's interests while still aiming to avoid retaliation, escalation, or third-party intervention.[3]

The purpose of this report is to document the findings from a study of Russian gray zone tactics that included a series of war games along with in-depth research on the topic. Both forms of analysis contributed to the insights discussed later in this chapter.[4] The remainder of the report is organized as follows. Chapter Two details the methodology employed in this study. It is followed by chapters reporting the study's main insights, which include a framework to better understand Russian gray zone tactics. Finally, there is an appendix that provides more information about the war games.

CHAPTER TWO

Methodology

To study the dynamics of Russia's gray zone activities, we employed two methodologies in an iterative way. Our aim was to develop a framework that could be used to understand the variety of different Russian gray zone tactics in Europe and also to inform U.S. strategic planning. To develop this framework, we combined extensive historical research and a review of relevant literature (including strategic documents, interviews, and analysis by other scholars) with a series of war games intended to both inform the ongoing research and further test emerging insights.[1] The process was iterative in that we conducted both tasks simultaneously, with the research informing the games and the games informing the research. Both activities contributed equally to the final framework and key insights presented in this report.

The gaming and research efforts were integrated in several ways. We began by researching Russia's gray zone activities, but also began running open-ended and loosely structured games with expert players. These initial games helped us gain a better understanding of the nature of the competition and focused us on particular aspects of the problem that appeared most challenging to the United States and European partners. In other words, the early games were valuable in guiding our research, pointing us toward key questions—such as whether Russia's choice to employ certain types of gray zone tactics is dependent on location, timing, and context—and insights that warranted additional investigation, such as the dominant role of civilian organizations in

[1] We ran a matrix gray zone game three times, a semistructured gray zone game twice, and a structured gray zone game twice.

Page 362 of 3957

Page 363 of 3957

combatting Russian gray zone tactics. At times, the games pointed us toward interesting observations that we then investigated further through research, including in interviews with subject-matter experts (SMEs) and government officials in Europe. Although players occasionally made important decisions during game play, it was mostly the postgame deliberations where we collectively considered the pros and cons of various strategies, and the competition more broadly, that led us to new insights that are expounded on throughout this report. In the later stages of the research effort, semistructured and structured games also served as a platform for testing various hypotheses and insights. Again, although player moves and game outcomes were interesting, postgame discussions with players and research team members were equally important. In several cases, after testing a hypothesis in a game, we conducted additional research to refine or improve our understanding of key dynamics.[2]

The framework and insights presented in this report are a synthesis of our research and observations made during the games and postgame discussions. The report does not describe specific moves made by the players during these games or the outcomes of the games, which could be misleading, but instead focuses exclusively on the insights that emerged from our broader cycle of gaming and research.

Designing the Games

As mentioned previously, we developed and ran several types of games. The first gray zone games were matrix games that were largely free-form exercises where the players made arguments that were judged by umpires about what they could do and to what effect.[3] We then devel-

[2] An example of a hypothesis we tested in one of the structured games: Russia seeks to actively halt NATO enlargement in the Balkans.

[3] There are three types of strategy games discussed in this report: free-form games, matrix games, and structured games. Free-form games (also known as seminar-style games) have few rules or physical elements, and game outcomes are determined by expert adjudicators in an ad-hoc way. Matrix games are a specific type of argumentation-based free-form game, where the teams present reasons why they could or their adversary could not do something,

Page 363 of 3957

Page 364 of 3957

oped a semistructured game that provided the players with a menu of options, pieces, a board, and a partially specified set of adjudication rules. Finally, we constructed a fully structured game with detailed rules that guided what the players could do and the effect of their actions.[4] Our gray zone games were intended to serve as vehicles for the players to develop coherent strategies, explore the pros and cons of different decisions, and to have a robust discussion that helped them to identify which strategies are most likely to be effective in different situations and which strategies appear the most robust against a variety of possible futures.

All of our gray zone games comprised a Russian (Red) team, tasked with expanding its influence and undermining NATO unity, competing against a European (Green) team and a U.S. (Blue) team, aiming to defend their allies from Russia's gray zone activities without provoking an outright war.[5] The players in our games were RAND Corporation experts on Russian, European, and U.S. defense and intelligence policy, and they role-played the appropriate country which aligned with their expertise.

Creating these games was an iterative process that involved extensive research on the concept of the gray zone, Russia's unconventional tactics, counteractions to Russian measures, and their effectiveness (see Figure 2.1). In the course of our research, we consulted a wide variety of sources on Russia's gray zone tactics, including journal articles, think tank studies, government reports, and periodicals. We used this

---

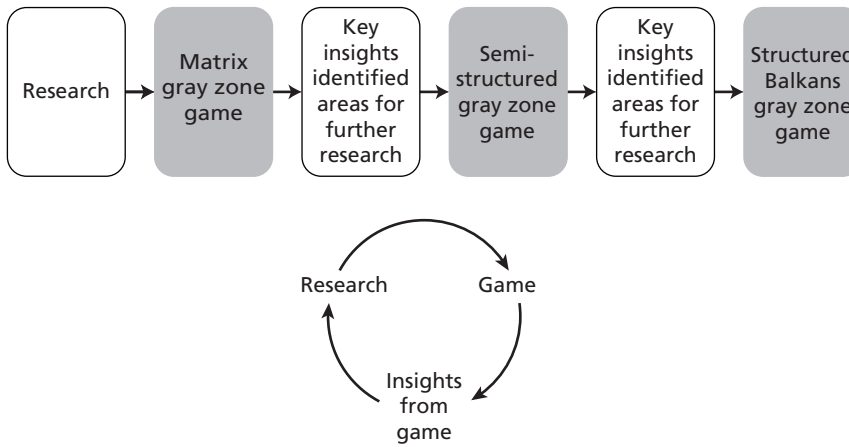
and then an adjudicator or umpire makes a final determination based on the net quality of the argumentation for and against an action. Structured games typically represent the phenomena with physical elements (e.g., cards and blocks) and have rules that determine game outcomes. For more on these see Becca Wasser, Jenny Oberholtzer, Stacie L. Pettyjohn, and William Mackenzie, *Gaming the Gray Zone: Observations from Designing a Structured Gray Zone Strategy Game*, Santa Monica, Calif.: RAND Corporation, RR-2915-A, 2019.

[4] John Curry and Tim Price, *Matrix Games for Modern Wargaming: Developments in Professional and Educational Wargames Innovations in Wargaming*, Vol. 2, Barking, UK: Lulu Press, Inc., August 2014; Warren Wiggins, *War Game Adjudication: Adjudication Styles*, Newport, R.I.: United States Naval War College, 2014.

[5] We follow the traditional wargaming practice of calling the U.S. team the "Blue team," U.S. allies the "Green team," and the adversary—in this instance, Russia—the "Red team."

Page 364 of 3957

Figure 2.1
Gray Zone Game Design Process



research to develop simple adjudication rule sets for the games; these rule sets distilled the existing empirical literature on individual gray zone tactics and countermeasures into a set of probability curves represented as a combat results table. These rules captured the central causal relationships of different phenomena but were simple enough that they allowed for relatively quick adjudication so that the game could be played in the course of a day. We do not claim that the rules or the underlying relationships are "correct;" rather, they are consistent with the literature and the understanding of these phenomena of the experts who played in our games, and offer a standard baseline for determining game outcomes.[6] A companion report, *Gaming the Gray Zone: Observations from Designing a Structured Gray Zone Strategy Game*, discusses the game design at greater length.

[6] In the structured Balkans gray zone game, game rules were printed on cards and therefore accessible to the players, who could understand what drove outcomes. The players could then argue with the adjudicators if they believed that the rules were wrong. When the adjudicator agreed that the rules did not accurately capture a dynamic in the game, they were modified in real time and the change was noted and incorporated into future iterations of the game.

CHAPTER THREE

The Gray Zone Is More Usefully Conceptualized as a Type of Tactic, Rather Than an Operational Environment

Because there is no commonly accepted definition of the "gray zone," we began by surveying the existing literature and cataloging different definitions, and then used our early games to crystalize our own thinking about the concept. Although many conceive of the gray zone as a phase of conflict, our postgame conversations led us to recast it as a type of tactic. Identifying the *gray zone* as a tactic—rather than a type of conflict or operating environment—is a new approach, but one that has greater analytic coherence and is more useful for crafting civilian and military strategies to counter gray zone activities.

Generally, there was agreement, both among game participants and during interviews conducted as part of the broader research project, that *ambiguity* is the defining characteristic of gray zone activities.[1] There might be ambiguity about who is responsible for the actions, as was the case initially in Crimea and the Donbass; ambiguity about the legality or veracity of the claims made, as is true for much of Russia's propaganda; or ambiguity about Russia's true aims, as is true with the unstated purpose of Russia's promotion of its culture and heritage.[2] Employed in the absence of conventional war, gray zone tactics are a

Page 366 of 3957

Page 367 of 3957

covert subset of political warfare, which was defined by George Kennan as "employment of all the means at a nation's command, short of war, to achieve its national objectives."[3] Gray zone tactics exist beyond the realm of traditional statecraft and intelligence activities, but stop short of the use of conventional military power—although as *tactics*, they might still be employed even after a conflict has escalated to the conventional level, as we have seen in Ukraine, and just as propaganda and guerrilla warfare were elements of World War II.[4]

The murky nature of gray zone tactics is often identified as critical to their success because it prevents their target from quickly recognizing the threat or from rapidly gaining support from equally undecided external actors and institutions, reducing the likelihoods of rapid retaliation or escalation. This is particularly a concern for a large multilateral organization, such as NATO, where all members of the alliance need to agree to activate the collective security clause embodied in Article V, which in turn requires them to assist the party under attack.[5] Nevertheless, the veil of deniability is often quite thin, especially when Russia has employed belligerent and militarized gray zone tactics and trained observers were able to quickly see through it as was the case of the Russian invasion of the Donbass.[6]

We focus on gray zone *tactics* versus the gray zone as a distinct type or sphere of conflict. Many others conceptualize the gray zone as a separate form of warfare that falls somewhere in the middle of a spectrum between peace and conventional war.[7] This is in line with

---

[3] Overt political warfare or other white measures short of war are not a form of gray zone tactics. George Kennan, "George F. Kennan on Organizing Political Warfare [Redacted Version]," Wilson Center Digital Archive, April 30, 1948.

[4] Some, such as Mazarr and Lanoszka, define gray zone tactics as something only revisionist states—those that seek to alter the status quo—use, but in fact one could argue that covert actions, which the United States and other countries employ and have used extensively in the past, are a gray zone tactic.

[5] Mazarr, 2015, p. 39.

[6] Andrew Roth, "From Russia, 'Tourists' Stir the Protests," *New York Times,* March 3, 2014b; Andrew Higgins, Michael R. Gordon, and Andrew Kramer, "Photos Link Masked Men in East Ukraine to Russia," *New York Times*, April 20, 2014.

[7] Hoffman, 2015, p. 26; U.S. Special Operations Command, *The Gray Zone*, September 9, 2015, p. 1.

Page 367 of 3957

Page 368 of 3957

the U.S. military's linear phasing construct for operational plans, but has contributed to conceptual muddling because it is not clear whether there are really boundaries between the phases. At the same time, it is clear that Russia has used various forms of unconventional warfare in both peacetime and as an element of large conventional military operations.[8] The gray zone as a middling level of competition also lends support to Russia's narrative that it is not engaged in traditional aggression in such places as Georgia.[9] The conflict in the Donbass is also dominated by traditional combat with a smattering of gray zone activities that are intended to sow doubt about the true nature of the conflict.[10] It is extremely difficult to distinguish what falls in one phase versus another, and what phase a conflict is currently in, which in turn makes it difficult to identify the appropriate behavior that should follow. During their deliberations, the U.S. teams in our games struggled to determine what phase they were in at various points, and observed that the concept of the gray zone as a phase of competition was not only ambiguous and difficult to apply in practice, but also potentially inaccurate and misleading. Therefore, it is both intellectually more coherent and, for the policymaker, more operationally useful to conceptualize gray zone activities as a type of tactic rather than a unique form of conflict or operating environment.[11] Seen this way, it is clear that gray zone *tactics* might be the only or primary approach employed, or they might simply be a supplement to more-traditional warfare.

---

[8] For more on the problems that this type of phased thinking creates for gray zone competition see: Paul Scharre, "American Strategy and the Six Phases of Grief," *War on the Rocks,* October 6, 2016.

[9] Ariel Cohen and Robert E. Hamilton, *The Russian Military and the Georgia War: Lessons and Implications*, Carlisle: Pa.: Strategic Studies Institute, June 2011.

[10] Michael Kofman and Matthew Rojansky, "A Closer Look at Russia's 'Hybrid War,'" *Kennan Cable,* No. 7, April 2015; Michael Kofman, "Russian Hybrid Warfare and Other Dark Arts," *War on the Rocks*, March 11, 2016; Andras Racz, *Russia's Hybrid War in Ukraine: Breaking the Enemy's Ability to Resist*, FIIA Report 43, Helsinki, Finland: Finnish Institute of International Affairs, 2015, p. 14.

[11] This is similar to how Mazaar (2015) uses the term, p. 58. Jackson (2017) argues that it is better to look at revisionist tactics, in particular avoiding redlines, using intermediaries, and presenting a *fait accompli*.

Page 368 of 3957

Page 369 of 3957

It is also important to mention that gray zone or hybrid tactics are a Western concept and not used by Russian strategists to refer to their own actions. Writing that is often associated with Russia's hybrid strategy, such as those articles written by Russian chief of the General Staff General Valery Gerasimov, is actually describing a Western campaign of indirect action that is being waged against Russia using nonkinetic tools.[12] In the views of such authors, the West uses indirect actions to undermine unfriendly governments, which is what these authors believe happened in Ukraine.[13] This is not a radically new way of thinking about war for the Russians because the Soviet Union extensively engaged in active measures during the Cold War. Additionally, the Russian general staff has been studying asymmetry in modern conflicts for nearly 20 years.[14]

Are Gray Zone Tactics New?

Although the phrase *gray zone* is relatively new, the types of actions that it describes are not.[15] Some recently employed Russian gray zone tactics include the use of traditional and social media to spread propaganda and disinformation; cyberattacks against government communications and critical civilian infrastructure; efforts to surreptitiously buy up large stakes in key economic sectors in foreign countries or to

---

[12] See, for example, Valery Gerasimov, "Znacheniye nauki nakhoditsya v predvidenii: novyye vyzovy trebuyut pereosmysleniya form i metodov vedeniya boyevykh deystviy [The Value of Science Is in Foresight: New Challenges Demand Rethinking the Forms and Methods of Carrying Out Combat Operations]," *Voyenno-Promyshlennyy Kuryer [Military Courier]*, February 26, 2013; Vi Lutonvinov, "I ispol'zovanie nevoennykh razvitie mer dlia ukrepleniia voennoi bezopasnosti Rossiiskoi Federatsii [The Use of Nonmilitary Development Measures to Strengthen the Military Security of the Russian Federation]," *Voennaia mysl' [Military Thought]*, No. 5, May 2009; S. Page 370 of 3957

coopt business elites; support for politicians or political parties, gangs, and paramilitaries; promotion of Russian, Slavic, or Orthodox culture; and the use of unmarked soldiers or "little green men." Table 3.1 provides an overview of major types of gray zone tactics employed by Russia and examples thereof. This list is not meant to be comprehensive, but instead is intended to provide a sense of the types and breadth of Russian gray zone tactics. Russia often employs multiple combinations of gray zone tactics together.

What has been new and surprising to the United States and its European allies is the idea that they are facing a Russia that is actively and aggressively trying to influence their domestic politics and weaken the Western institutions that have underpinned the post–Cold War international order through the employment of these tactics. NATO's newest members, especially the former members of the Soviet Union and Warsaw Pact (in addition to aspirant states) are thought to be likely targets and particularly vulnerable to Russian gray zone aggression. Despite this fact, many policymakers in Europe and especially in new member states believe that accession to NATO insulates them from violent gray zone tactics. Yet, the Red teams specifically chose new and aspirant NATO members to target in our games.[16] Recently, it has also become clear that Russia has sought to interfere, albeit in a much less overt way, in the politics of longstanding NATO members.[17] In response, NATO and the European Union (EU) have focused more attention and resources on challenging Russia's unconventional tactics and have taken several steps to counter this threat.

---

[16] Montenegro, in particular, was a consistent focus for the Russia teams in our games given its recent accession to NATO.

Page 370 of 3957

Page 371 of 3957

Table 3.1
Russian Gray Zone Tactics

Gray Zone Tactics	Example
Religious and cultural influence	
• Promotion of Russian language and culture	• Establishment of Russian Centers in European states with ethnic Russian populations, funded by the Russkiy Mir Foundation[a]
• Expansion of Russian Orthodox Church	• The Kremlin financed the building of a Russian Orthodox Cathedral in Paris[b]
• Use Russian Orthodox Church to intervene in political issues	• The head of the Montenegrin Orthodox Church denounced Montenegro's decision to support the EU stance on Crimea[c]
• Passportization	• Intentional distribution of passports to ethnic Russians by Russian authorities in specific parts of foreign countries (e.g., Ukraine and Georgia)[d]
Propaganda and information operations	
• Disseminate propaganda through state-controlled news channels	• Crafted narrative in state media outlets that exaggerates impact of refugee crisis in Europe[e]
• Create local media outlets to promote pro-Russian messages	• Government-linked private Russian media conglomerates (e.g., Gazprom Media) broadcast popular channels with diverse programming (e.g., NTV Mir into the Baltics or the First Baltic Channel's local news program Latvian Time)[f]

Page 371 of 3957

Page 372 of 3957

Table 3.1—Continued

Gray Zone Tactics	Example
• False news and disinformation campaign	• Russian media report that NATO was planning to base nuclear weapons in Sweden as part of a broader campaign to discourage movement toward NATO[g]
• Amplify pro-Russian message with trolls and bots	• Russian trolls are used to spread disinformation in Ukraine online (e.g., denying that Russian forces are present)[h]
• Fund trolls and bots to take punitive actions against activists	• Disguised Internet Research Agency trolls and bots manipulate social media sites to get the accounts of Ukrainian activists suspended[i]
• Bribe or pressure journalists to influence content	• Paid Macedonian journalists to promote a common Slavic and Orthodox identity in their content[j]
Cyber operations	
• Hack sensitive or embarrassing information and provide to third parties to make public	• Macron campaign emails were hacked and given to WikiLeaks during the 2017 French presidential election[k]
• Disrupt online communications and commerce through distributed denial of service (DDOS) attacks	• Widespread DDOS attack against Estonian government, media, and financial institutions for two weeks in 2007[l]
• Boost pro-Russian narrative through malware attacks	• The Bedep Trojan Malware infected computers, forcing them to access a variety of pro-Russian content, artificially inflating the popularity of such content in searches[m]
• Disable or destroy infrastructure	• An explosion in Turkey damaged the Baku-Tbilisi-Ceyhan pipeline days before the Russian invasion of Georgia[n]

Page 372 of 3957

Table 3.1—Continued

Gray Zone Tactics	Example
• Disseminate destructive malware to disable governments and industries	• In June 2017, NotPetya malware hit Ukrainian financial, energy, and government institutions on the eve of a national holiday. The virus pretended to be ransomware, but this was deception because it actually aimed to delete and deny access to data and spread quickly to 64 countries[o]
Support for proxies	
• Provide financial support to nongovernmental organizations (NGOs) to further entrench ethnic and social cleavages	• Russian Ministry of Foreign Affairs has provided funding to the Latvian Human Rights Committee, which focuses on the Russian minority in Latvia[p]
• Develop and sustain ties to criminal networks to earn money, gain intelligence, and act as Russian agents	• Russian Federal Security Service (FSB) has ties to international criminal traffickers, including cigarette smugglers in Estonia; these ties allegedly led to the kidnapping of an Estonian intelligence officer who was investigating the illicit activity[q]
• Support paramilitaries and separatists	• In 2016, Russian military and intelligence helped to create the multinational Balkan Cossack Army, a militaristic pan-Slavic association, and tie it with the Night Wolves gang in Montenegro, which was later implicated in an attempted coup plot[r] • Russian Main Intelligence Directorate (GRU) ties with the Hungarian neo-Nazi group Hungarian National Front (MNA) dated back to 2012, and were revealed after an MNA leader murdered a policeman in 2016; the GRU participated in military style exercises with MNA[s]
• Provide financial support and publicity to political parties	• Russia funded the Euroskeptic and nationalist Alternative for Deutschland (AfD) party in Germany and provided positive coverage in Russian media before the 2017 elections[t]

Page 373 of 3957
Page 373 of 3957

Table 3.1—Continued

Gray Zone Tactics	Example
• Organize protests	• Russian diplomats reportedly worked with nationalists and the Orthodox church to help organize protests in the Greek town of Alexandroupolis against an agreement that ended the naming dispute over Macedonia[u]
Economic coercion	
• Secure controlling interest in critical economic sectors	• Russia's Sberbank purchased 40 percent of indebted Croatian food group Agrokor, becoming its largest shareholder[v]
• Disrupt energy flows or complicate access to energy supplies	• Russia raised gas prices for Ukraine by 80 percent in April 2014 because of an alleged export duty[w]
• Embargo goods under false pretenses	• Russian banned European pig meat, allegedly because of fears of African swine fever, during Maiden protests[x] • In 2006 and 2013, Russia banned Moldovan wine imports because of "sanitation concerns"[y]
Violent or military coercion	
• Unacknowledged military harassment	• Russian Su-24 fighters buzzed the USS *Porter* in February 2017, but Moscow denied that the incident occurred[z]
• Create and sustain frozen conflicts as a source of persistent instability	• Russia supported Transnistrian separatists with the 14th Russian Army in 1992 and then deployed "peacekeeping" forces, in addition to providing free gas and other subsidies to the breakaway Moldovan region[aa]
• Fuel civil war	• Russia provided arms, training, and direct military support to Ukrainian separatists fighting in eastern Ukraine during the 2014 conflict[bb]

Table 3.1—Continued

Gray Zone Tactics	Example
• Assassinate politicians, activists, journalists, and former officials opposed to Russian activities outside its borders	• A nerve agent was used to attempt to assassinate a former spy living in the UK in March 2018[cc]
• Attempt to oust uncooperative governments forcibly	• Russia backed a coup attempt to install a pro-Russian president in Montenegro to prevent NATO accession[dd]
• Intimidate or detain journalists	• Journalists in Ukraine were detained, harassed, and denied access by pro-Russian separatists in the Donbass[ee]
• Provide military cover to secession	• Russia supported a referendum on secession in Crimea that violated Ukraine's constitution and occurred under the cover of a Russian military occupation[ff]
• Creeping borders	• Russia incrementally shifts Georgia's internationally recognized border by moving the fence and FSB guards separating it from Russia in South Ossetia[gg]

CHAPTER FOUR

"Everyday" Gray Zone Actions Must Be Differentiated from More Aggressive, Focused Gray Zone Actions

Our research, games, and postgame discussions suggest some critical differences between the types of Russian gray zone tactics. An understanding of these differences is central to developing a clear framework and sense of how gray zone activities fit with other conventional military tactics. A recent U.S. Senate staff report expressed criticism of the U.S. government for not "hav[ing] a coherent, comprehensive and coordinated approach to the Kremlin's malign influence operations."[1] This is undeniably true, but it is in part because of the fact that there are important differences among Russia's gray zone activities that are often overlooked and which necessitate different types of responses. The first key insight emerging from the games and our research is that there are two central variables: the target of the action and whether it involves outright violence or the threat of violence. These variables are important for understanding Russian gray zone tactics because they imply different time horizons, objectives, and stakes. Many of the unconventional tactics that Russia uses to try to gain influence are routine, diffuse, and long-term, although others have very specific short-term objectives. Russian gray zone tactics might also be nonviolent, such as propaganda and disinformation, or involve outright violence or the threat of violence, such as the planned coup in Montenegro. Figure 4.1 shows how these two variables intersect to create four types of gray zone tactics and examples of each.

[1] U.S. Senate, 2018, p. 3.

Page 378 of 3957

Figure 4.1
Types and Examples of Gray Zone Tactics

Page 380 of 3957

The upper left-hand box represents everyday nonviolent gray zone tactics, which often have very general, high-level goals, such as enhancing Russian influence, and an imprecise notion of how specific actions will create a desired effect.[2] The Russian government appears to hope that these routine gray zone actions will benefit Russia and weaken the West in some way, but exactly how, when, and why often is not known when the actions are performed.[3] The everyday gray zone activities include propaganda and disinformation disseminated through traditional media and social media outlets; efforts to promote Russian, Slavic, or Orthodox culture; cultivating allies in politics or business; gathering intelligence on government actions and key individuals; and expanding Russia's economic influence by, for example, purchasing debt or large portions of key business sectors.

Routine gray zone actions are low-cost and low-risk, which is why Russia widely and opportunistically employs them in the hope that some might ultimately pay off. Likewise, Russia also expects many of them to have little or no effect, especially in the short term. One example is the multifaceted Russian effort to promote Russian, Slavic, and Orthodox culture in its near abroad. On their face, these activities might appear benign, but they can create or deepen divisions within other countries, and provide Russia with intermediaries that it can use to further its interests, and a reason to be actively involved abroad.[4] For instance, the Federal Agency for the Commonwealth of Independent

[2] U.S. Senate, *Disinformation: A Primer in Russian Active Measures and Influence Campaigns, Panel II: Hearing Before the Select Committee on Intelligence of the United States Senate*, Washington, D.C.: U.S. Government Publishing Office, March 30, 2017, pp. 1–2, testimony of Thomas Rid. According to Rid, "active measures are semi-covert or covert intelligence operations to shape an adversary's political decisions. Almost always active measures conceal or falsify the source—intelligence operators try to hind behind anonymity, or behind false flags."

Page 380 of 3957

Page 381 of 3957

States, Compatriots Living Abroad, and International Humanitarian Cooperation (commonly known as *Rossotrudnichestvo*) fosters the concept of the Russian World (*Russky Mir)* and has more than 60 centers, mainly in former Soviet states.[5] Although *Rossotrudnichestvo* is an autonomous Russian government agency, the Kremlin also supports such ostensibly independent NGOs as the World Congress of Russian Compatriots and World Without Nazism, which encourage traditional Slavic and Orthodox values and practices. These NGOs use the shared historical experience of fighting fascists during World War II as a reference point to rally opposition to current threats to traditional values, in particular Western institutions, such as the EU and NATO.[6]

Russian gray zone activities also seek to develop relationships with non-Russian partners who have similar agendas to Moscow or can indirectly advance the Kremlin's agenda. For instance, after Marine Le Pen, the president of the French National Front (now National Rally) party, publicly supported Russia's annexation of Crimea and called for the ending of economic sanctions on Russia, the Moscow-based First Czech-Russian Bank provided her party a much-needed €9.4 million loan.[7] Le Pen denied that the loan had anything to do with her stance on sanctions, although it made Le Pen a potential partner for Moscow.

The behavior and decisions of the Russia teams in our games provided some new insights and support for this framework and relationships between gray zone and more conventional activities. Specifically, these teams liberally sprinkled routine gray zone activities across as many targets as possible and then opportunistically adjusted their strategies to capitalize on previous successes. Both in our analysis of actual Russian actions and in our games, the majority of steady-state gray zone activities are long-term ventures that seek to shape public opinion, create or deepen fissures in a society, develop proxies, expand Russian media presence, and enhance Russia's ability to undertake more pointed gray zone operations in the future. Most of these measures are

Page 381 of 3957

Page 382 of 3957

not likely to directly further Russian objectives on their own, but they might cumulatively alter the social, political, and economic fabric of a country in ways that facilitate a subtle or gradual pro-Moscow shift.

However, nonviolent gray zone tactics can also be employed in a concentrated manner to achieve a specific near-term goal, which is captured in the upper right-hand box of Figure 4.1. Examples of such behavior include organizing peaceful protests, cutting off economic exchanges for dubious reasons, and interfering in foreign elections.[8] Targeted actions often rely on mobilizing the contacts or sentiment that Russia had previously cultivated through long-term diffuse gray zone tactics. Similarly, these actions are largely reliant on opportunities and events for Russia to exploit in the target country. For example, Russia appears to have organized and resourced anti-fracking movements in Bulgaria and Romania in an effort to scuttle deals made by American energy corporations that threatened Gazprom's dominance in the region. Russia deployed a media blitz against shale exploration deals and called on a variety of old and new allies to oppose the moves, including socialist parties, the Orthodox Church, sports clubs, environmental NGOs, and business contacts. Moscow allegedly even paid to bus protestors to the demonstrations.[9]

Russia also tries to subvert the democratic processes in other countries by influencing electoral outcomes, as has been alleged in the 2016 Brexit referendum, the 2016 U.S. presidential election, and the 2017 French presidential election. Russia attempted to tilt these votes through sophisticated disinformation campaigns and cyberattacks. Although Moscow's actions might have had a significant, direct impact

---

[8] In 2014, Moscow announced a ban on Polish fruits and vegetable imports for "sanitary reasons," but it was believed to be in retaliation for EU sanctions against Russia. Polina Devitt, "Russia Bans Polish Fruit and Vegetable in Apparent Retaliation for Sanctions," Reuters, July 30, 2014.

Page 382 of 3957

Page 383 of 3957

on the target country's policies, they still fall into the category of nonviolent targeted gray zone actions because Russia acted opportunistically and exclusively used nonmilitary tools in an effort to swing the polls. In our games, Red teams always tried to sway scheduled elections because the risks of doing so were relatively low and, although the probability of obtaining a payoff was also low, the reward was potentially very high.

However, many Russian gray zone tactics have a much sharper edge than those discussed previously because they involve the threat or application of force. The lower-left hand box of Figure 4.1 shows diffuse gray zone tactics that at least implicitly involve the threat of violence, including efforts by Russia to cultivate ties to criminal or paramilitary organizations. The Kremlin and, in particular, Russia's intelligence agencies have extensive ties to the criminal underworld and use these organizations as deniable agents that can carry out such illicit tasks as strongarming opponents, gathering intelligence, and at times having individuals within these organizations act as hitmen. Additionally, criminal organizations can be used to secure cash that can fund other ventures that the Kremlin does not want to traced back to it.[10] For instance, Moscow reportedly began funding the Night Wolves motorcycle gang in 2013, and through these efforts, managed to turn the organization into an ultranationalist government proxy.[11] The Night Wolves go on tours, such as their 2018 trip to the Balkans, to propagate pro-Russian views and to impress and intimidate observers.[12]

Russia also seeks to develop relationships with paramilitary organizations. In Bosnia, for instance, the Kremlin is reportedly helping to develop Serbian Honour, a new militia loyal to Milorad Dodik, the president of the semi-autonomous Republic of Srspka (RS), who is "a

[12] Whether the Night Wolves really intimidate has been questioned. Andrew Higgins, "Russia's Feared 'Night Wolves' Bike Gang Came to Bosnia. Bosnia Giggled," *New York Times*, March 31, 2018.

Page 383 of 3957

Page 384 of 3957

frequent visitor to Moscow."[13] Russian mercenaries with ties to the Kremlin allegedly began training Bosnian Serb recruits at a training center, funded by Moscow, in Serbia.[14] This is exacerbating already tense relations between RS and the Bosniak-Bosnian Croat Federation. RS seeks more autonomy—if not complete independence—from Bosnia, and promotes an ultranationalist Serbian agenda.[15] A Bosnian Serb paramilitary has heightened fears of sectarian violence and deepened divisions within Bosnia, and potentially could be used as a means of destabilizing the state should it seek to move closer to NATO.

Additionally, Russia has undertaken much more aggressive and directed short-term gray zone actions that involved the threat of or actual use of violence, usually when it perceived its vital interests to be at risk, which is displayed in the lower right-hand box. This category includes Russia's 2008 war in Georgia and the 2014 war in the Donbass in eastern Ukraine. From the start, the former was a conventional military offensive disguised as a peacekeeping operation, which included a small number of gray zone tactics, including cyberattacks to interrupt Georgian government communications, and a media campaign to promote the Russian government's narrative in the breakaway region of South Ossetia and to the international community.[16]

The latter operation began principally with gray zone tactics, primarily the use of Ukrainian proxies, such as the Donetsk People's Republic and Luhansk People's Republic militias, which were bolstered by both irregular and regular forces from Russia.[17] The Russian forces

[17] The Ukrainian insurgency was manufactured by the Kremlin, and the Ukrainian separatist organizations were fragmented, weak, and wholly dependent on Russian support to survive. Franklin Holcomb, *The Kremlin's Irregular Army: Ukrainian Separatist Order of*

Page 384 of 3957

Page 385 of 3957

were purported to be sympathetic "volunteers," including the Night Wolves, foreign fighters in the multinational Vostok Brigade, and Russian military personnel who supposedly took a leave of absence to support their Ukrainian allies.[18] Russia's initial strategy, which was heavily reliant on proxy and unmarked forces, failed as the Ukrainian government was able to push the separatists to the brink of defeat.[19] To save its proxies, Russia deployed large numbers of conventional forces beginning in August 2014 and moderated its goals from aiming to undermine the Ukrainian government to consolidating the separatists' foothold in the Donbass region, thereby ensuring that the conflict would continue and providing Moscow with a lever that it could use to dial up or dial down pressure on the Ukrainian government in Kyiv. Although Russian proxies and the GRU continue to be active in Ukraine, the fight is still predominantly conventional combined-arms operations of lower intensity, even though Moscow does not acknowledge its role in the war.

Even the takeover of Crimea, which arguably involved the most successful deployment of gray zone tactics to date—Russia was able to annex the peninsula without going to war—depended heavily on conventional Russian forces. While local pro-Russian self-defense "volunteers" and proxies assisted by, for example, blocking the roads in Sevastopol, the operation was led by Russian special forces (spetsnaz) and unmarked Russian soldiers from the 810th Independent Naval Infantry Brigade (a marine unit). The operation was facilitated by a large snap exercise in the Western and Central Military Districts to cover for troop movements, divert attention from the events in Crimea, and

Page 385 of 3957

Page 386 of 3957

deter the Ukrainian government from intervening.[20] In short, although gray zone tactics were employed in Georgia, Crimea, and the Donbass, all three involved Russian military forces capturing territory, and only in Crimea was conventional combat avoided.[21]

These high-intensity gray zone actions were not opportunistic, but were in reaction to a perceived threat to Russia's vital interests, specifically, the dangers posed by the potential expansion of NATO and EU membership to Georgia and Ukraine, respectively. As a result, Moscow was willing to use more risky tactics that directly involved Russian military forces and therefore had a higher probability of being uncovered and leading to unwanted consequences, as ultimately occurred in the Donbass. These Russian offensives were primarily military in nature, with support provided by diplomatic, economic, information, and cyber gray zone actions. In our games, the Russian players were quite reluctant to use military forces, even "little green men," for fear of inadvertent escalation. This result might be because the games did not present the Red teams with a scenario in which their vital interests were endangered, as they were perceived to be in 2008 and 2014. Additional iterations of the game would help to determine whether the Red teams generally preferred nonviolent gray zone tactics or whether they were willing to take covert violent action and overt military operations when the stakes were high enough, particularly when coupled with further research in this area.

There have also been less militarized—but still coercive and violent—Russian gray zone actions in response to a particular crisis, or intended to achieve a specific objective. In October 2016, Moscow conspired with two members of Montenegro's Democratic Front (DF) party and several Serb nationals to launch a last-ditch effort to derail Montenegro's entry into NATO by trying to overthrow the govern-

Page 386 of 3957

Page 387 of 3957

ment.[22] Russia only resorted to this elaborate scheme, which involved a planned attack on parliament and an assassination attempt on Montenegro's prime minister, after its softer gray zone tactics aimed at undermining Montenegrin support for NATO—including a concerted information operation campaign, funding the anti-NATO DF party, and backing anti-NATO protests—had failed.[23]

Similarly, during the 2007 "bronze soldier" incident, Russia orchestrated protests and riots in Tallinn, a siege of the Estonian embassy in Moscow, and widespread cyberattacks that disabled many Estonian websites for nearly two weeks in response to a decision by the Estonian government to relocate a Soviet World War II memorial.[24] Although the stakes were much lower in this episode, which was a test of Tallinn's resolve and Russia's ability to employ gray zone techniques, Russia was willing to use these varied gray zone tactics, including inciting violence, in an attempt to compel Tallinn to leave the bronze soldier monument in place.

CHAPTER FIVE

NATO and the EU Are Unlikely to Be Able to Compel Russia to Stop Using Nonviolent, Everyday Russian Gray Zone Tactics, but They Might Be Able to Deter Higher-Order Aggression

There is much talk about "deterring" Russian gray zone aggression, but many of these discussions are based on a misunderstanding of the concept. Both deterrence and compellence are types of coercive threats that work by altering a target's expectations about future pain, but deterrent threats aim to persuade the target not to initiate a particular action, and compellent threats aim to convince the target to change its behavior. As one of our players observed, because Russia is *already* engaging in diffuse gray zone actions, NATO and the EU need to *compel* Russia to stop these activities, which is a much harder task than deterrence.[1] To date, NATO and the EU remain focused on deterrence, rather than compellance, making this proposition a shift in these institutions' approach.

To successfully deter, one must credibly threaten painful consequences, which involves demonstrating a capability and willingness to follow through on that threat and waiting to see whether the target complies. In contrast, to successfully compel a target to reverse or halt its ongoing behavior, one must actually inflict pain and couple it with a promise to end the pain if the target relents. It is not clear that NATO

[1] Compellence requires the target to change its ongoing behavior—in which it is invested—at some cost to its reputation. To compel a target, one must alter or reduce the utility of its current course of action compared with the utility of ceasing. Thomas C. Schelling, *Arms and Influence*, New Haven, Conn.: Harvard University Press, 1966, pp. 69–90.

Page 388 of 3957

Page 389 of 3957

and the EU would go beyond the economic sanctions that are already in place to compel Russia to end its use of diffuse gray zone tactics.[2] Both the Green and Blue players in our games struggled to identify actions that they deemed to be sufficiently compellent *and* would be willing to implement. Moreover, the characteristics of routine or everyday gray zone tactics—the fact that they are largely nonmilitary, usually gradual, and difficult to decisively attribute—lowers the stakes and makes it difficult for the West to credibly threaten to punish Russia, even if the actions are conclusively traced back to Moscow.

Because many gray zone tactics are cheap in terms of cost and risk, Russia is willing to liberally use them even when the prospect of success is low. The Red teams in our games mirrored the real Russian government's indifference to having its covert gray zone activities uncovered, in part because of the lack of credible punishment. The Green and Blue players spent considerable time and effort trying to expose Red's clandestine activities, but even when they succeeded, this had little effect on any of the teams' behavior: Red teams continued their covert meddling as if nothing had happened, and the Green and Blue teams still found it hard to come up with credible ways to counter Red's activities or punish Red for engaging in them. Consequently, the Red teams saw nearly no downside to extensively making use of routine gray zone actions in the hopes that some would have an impact.

Even if more assertive and violent efforts—such as destabilizing a country or attempting to forcibly change the government through a coup—failed or were uncovered, there were few negative consequences for the Red teams in our games. This tracks not just with recent experience but also broader Cold War history. The United States was never able to halt Soviet active measures, which were the normal state of affairs during the Cold War: The Soviet Union conducted more than 10,000 individual disinformation operations during this time.[3]

Because of the challenges of attribution, deterrent threats against even targeted, nonviolent gray zone actions are not likely to be highly

---

[2] There are already many people calling for an end to the sanctions, despite Russia's continued use of diffuse and targeted nonviolent gray zone tactics across Europe.

[3] U.S. Senate, 2017, p. 2.

Page 389 of 3957

credible. It stretches the bounds of credulity to believe that a democratic country, which requires the support of its population, would take potentially costly coercive actions when the majority of its public remains unconvinced about who is responsible for a nonviolent attack. The need to convince 29 nations in the alliance makes it even less likely that a NATO threat would be viewed as credible. Although NATO has claimed that its Article V collective security clause applies to cyberattacks against members, it has not clearly articulated what types of cyberattacks would trigger this and what actions it would take in response. Establishing that Moscow is behind a gray zone tactic might put sensitive intelligence sources at risk and is also likely to take a considerable amount of time. For example, although the Federal Bureau of Investigation began to investigate Russian interference in the 2016 U.S. presidential election in June 2016, the investigation was still ongoing as of June 2019. The fact that consequences are not likely to be automatic or quickly implemented poses a further challenge to deterrence. Clandestine forms of retaliation, such as cyberattacks or covert action, might be possible because the public is not consulted, but these options are in and of themselves risky, cannot be threatened publicly, might be limited by the laws of a country, and therefore do not form the basis for a strong deterrent threat. Given these manifold challenges, it seems more effective to focus on improving the resiliency of vulnerable nations and taking other defensive measures to limit the effectiveness of Russian intervention, rather than focusing on deterring most gray zone tactics.

Outright Russian aggression—including gray zone tactics with the aim of territorial expansion—is an entirely different situation, and one that can be deterred. Because NATO did not have a security commitment or forces in place to defend Ukraine or Georgia, any attempts to deter Russia would likely have lacked credibility. In the future the alliance could, however, make it clear that it plans to stop aggression—whether conventional or masked by gray zone tactics—against any of its members. Doing so requires NATO to demonstrate the will and capability to act quickly to stop Russia from achieving its objectives,

Page 391 of 3957

as deterrence by denial would in any situation.[4] NATO military and intelligence services need to be on alert for Russian preparations disguised as gray zone subterfuge that could signal aggressive intentions. At the same time, political leaders need to be prepared for this eventuality and ready to listen to military and intelligence assessments so that they can quickly see through any ambiguity and take the appropriate actions. Both of these steps need to be buttressed by a military posture that would lend credibility to political leaders' warnings or threats about the consequences should Russia persist.

---

[4] Deterrence by punishment, the other alternative mode, does not appear to be a strong approach for dealing with Russian aggression against NATO. See David A. Shlapak, *The Russia Challenge*, Santa Monica, Calif.: RAND Corporation, PE-250-A, 2018; David A. Shlapak and Michael W. Johnson, *Reinforcing Deterrence on NATO's Eastern Flank: Wargaming the Defense of the Baltics*, Santa Monica, Calif.: RAND Corporation, RR-1253-A, 2016; Michael Petersen, "The Perils of Conventional Deterrence by Punishment," *War on the Rocks*, November 11, 2016.

Page 391 of 3957

CHAPTER SIX

Vulnerability to Russian Gray Zone Tactics Varies Significantly Across Europe

Russia employs gray zone tactics across Europe, but its interests vary, and its ability to successfully achieve its objectives through these means largely depends on the vulnerability of the targeted country.[1] This insight emerged from both our games and our analysis of past historical cases. In one of our early games, the Red team drew a map of Europe and defined different regions in which Russia had varied levels of interest and, in the Red team's perception, a different ability to influence because of the strengths and weaknesses of the countries in each area. Gray zone tactics often work best when they exacerbate preexisting tensions. Vulnerabilities fall into two different but not mutually exclusive categories: state fragility and polarization, and characteristics that provide Russia with leverage over the government and society.[2]

Fragile states provide openings because they suffer from pernicious factors, such as corruption; poverty; and political divisions, sectarian divisions, ethnic divisions, or some combination thereof, which can be exploited by Moscow's gray zone tactics to create instability.

[1] Treverton et al., 2018, p. 63.

[2] In the structured Balkans game, these factors affected a country's governance and orientation scores, which were relative, ordinal scales ranking from –2 to +2. Governance was a composite metric based on the Fund for Peace's Fragile States Index and the World Bank Worldwide Governance Indicators, although the orientation score was based on a more qualitative reading of the composition of a country's ethnic makeup, religious beliefs, and culture and its current attitudes toward Russia. As a part of scoring countries, we had regional experts review our initial scores and the justification for them. See Fund for Peace, "Fragile States Index," webpage, 2019; World Bank Group, "Worldwide Governance Indicators," webpage, 2019.

Page 392 of 3957

Page 393 of 3957

The politics in even relatively strong states might become polarized over divisive issues (e.g., immigration), opening avenues for Russian subversive actions. Countries can have cultural, economic, or historic ties to Russia that make it particularly susceptible to Russian gray zone influences. Proximity and, in particular, a shared border with Russia also ease Russian access to a country and concomitantly increase Russia's ability to undertake violent gray zone tactics. Economic dependence, particularly on Russian energy, is also an avenue that Moscow has been willing to exploit.

Although there are significant intraregional differences, one can identify four broad European regions—Russia's near abroad, the Baltics, the Balkans, and Western and Central Europe—where Russia's interests differ. But across these regions, there are roughly similar degrees of vulnerability to gray zone actions. This is depicted in Figure 6.1. Our games suggest that considering these four regions as distinct when preparing and planning to confront Russian gray zone tactics might be valuable, because of Russia's differing interests and the variation in vulnerabilities across these areas. The Red teams in our games emphasized that their interests varied across these areas and developed strategies unique to each region, based on their different objectives. Understanding these differences in interests, objectives, and existing vulnerabilities better enables NATO and the EU to identify the tools best used to counteract Russian gray zone tactics in different regions.

The countries that were identified of greatest importance were in Russia's near abroad: Armenia, Azerbaijan, Belarus, Georgia, and Ukraine.[3] Russia desires influence over these former Soviet states not only because of their shared history and language, but most importantly because these bordering nations provide an important defensive buffer against external attack.[4] Therefore, Russia views the expansion of NATO or the EU into its near abroad as a grave threat that must be stopped. The 2008 and 2014 Russian wars in Georgia and Ukraine

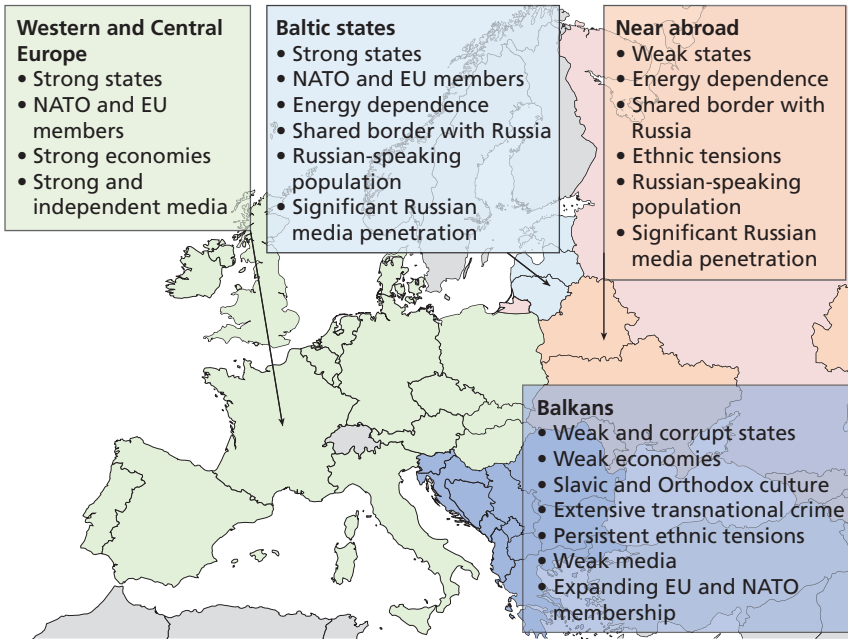
[3] The former Soviet republics in Central Asia are also usually included in the near abroad, but they were not a part these games.

[4] Andrew Radin and Clint Reach, *Russian Views of the International Order*, Santa Monica, Calif.: RAND Corporation, RR-1826-OSD, 2017, pp. 8–12.

Page 393 of 3957

Page 394 of 3957

Figure 6.1
Intra-European Vulnerability to Russian Gray Zone Tactics



were launched to thwart their membership bids by generating a persistent source of instability that would ward off further integration with the West.

Near-abroad nations bordering Russia have relatively weak militaries and poor governance, leaving them with few defenses against a Russian conventional offensive or clandestine infiltration, including land grabs by little green men. All also contain large Russian-speaking minorities that have historical, cultural, and economic links to Russia; these populations are consumers of Russian-controlled media and are potentially sympathetic audiences for gray zone information tactics.

By contrast, the Baltic states of Estonia, Latvia, and Lithuania are also former members of the Soviet Union, are adjacent to Russia, and Estonia and Latvia have sizable Russian-speaking minorities. However, they appear to be less susceptible to gray zone tactics than some other

Page 394 of 3957

Page 395 of 3957

regions.[5] This is due in part to the Baltic nations taking steps to mitigate some of their vulnerabilities. Estonia, for instance, has invested heavily in cyber defenses since the bronze soldier crisis, and all three nations are taking steps to reduce their dependence on Russian energy imports.[6] Additionally, the Baltic nations are relatively prosperous compared with other Eastern European nations and Russia, reducing the level of economic discontent into which the Kremlin can tap. Nevertheless, the Russian minority in the Baltics is less well-off than the rest of the population, in large part because economic opportunities still largely depend on being able to speak the official state language (i.e., not Russian); consequently, the Russian minority potentially could become aggrieved in the future.[7] Moreover, a favorite theme of the Russian media (which is popular among the Estonian and Latvian Russian-speaking populations) is how the Baltic states discriminate against their Russian minorities. To date, however, this message does not seem to resonate, because the benefits of living within the EU members of the Baltics—as opposed to Russia—seem to outweigh the relative disparity between Russian-speakers and the larger Estonian and Latvian populations.

The Baltics' most important defense against Russian gray zone attacks stems from the relative strength of their government institutions, which make them harder targets and better able to respond to covert infiltration than other former Soviet republics.[8] For instance, the Estonian defense chief stated that, if Russian special forces or clandestine agents entered their territory, they would "shoot the first one to appear."[9] All three Baltic nations have amended their laws to enable

---

5 Many argue that despite the fact that the Baltics are former members of the Soviet Union, they are of lesser interest to Russia since 2003.

Page 395 of 3957

Page 396 of 3957

their national militaries to operate in their countries during peacetime, and Estonia and Lithuania have exercised this capability.[10] Additionally, because the Baltics are members of NATO, and the alliance has stationed multinational battlegroups in each country, Russian covert infiltration or outright aggression is much riskier than in its near abroad.

Moreover, unlike Ukraine or Georgia, Russia does not seem to consider the Baltic states to be a critical part of its sphere of influence; instead, it aims to use the Baltics as a lever to destabilize and discredit NATO.[11] Given these factors, it appears that, although Russia could and has sought to destabilize Estonia, Latvia, and Lithuania through everyday gray zone operations, these tactics are likely to have limited effects. The Baltic states are also not particularly susceptible to clandestine land grabs. However, despite the enhanced forward posture, they remain vulnerable to a conventional offensive cloaked in gray zone tactics, especially information operations.[12]

There is considerable variation within the Balkans, but, in general, this region is an inviting target for Russian gray zone actions because of the weak rule of law, ethnic divisions, and relative poverty.[13] Nevertheless, because the Balkans are not contiguous with Russia and do not have significant Russian-speaking populations, Russia's gray zone activities would have a somewhat different character than the actions it takes in the former Soviet states, and are less likely to swing these states in a durably pro-Russian direction.

As a whole, the Balkans suffer from weak government institutions, resulting in autocratic leaders who can run roughshod over feeble

[13] There is no agreed definition of the Balkans. We consider the Balkans to include Albania, Bosnia and Herzegovina, Bulgaria, Croatia, Kosovo, North Macedonia, Montenegro, Romania, Serbia, and Slovenia.

Page 396 of 3957

Page 397 of 3957

civil society, a subservient media, pervasive corruption, and extensive transnational criminal organizations.[14] The Balkans are also the poorest region in Europe with high unemployment rates, which means that there is widespread dissatisfaction and resentment toward Europe as a whole, which can be exploited by Russia.[15] Finally, the Balkans remain afflicted by ethnic tensions, currently being rekindled by a renewed focus on historic grievances and another surge of nationalist sentiment in the region.[16] Ethnic violence and secessionist movements are particularly a problem in the former Yugoslavia (Bosnia and Herzegovina, Croatia, North Macedonia, Montenegro, Serbia, and Slovenia), where Russia has historic, religious, and linguistic ties to several groups.

Opinions about Russia vary significantly in different Balkan nations; in some, such as the Slavic language–speaking nations of Bulgaria and Serbia, a sizable part of the population views Russia positively.[17] But unlike the near abroad, where Russian gray zone activities primarily focus on already sympathetic populations, Russia courts allies on multiple sides in many Balkan nations. This places Moscow in a good position to stoke tensions, provoke sectarian violence, or encourage separatism. Yet because the nearest Russian military forces are stationed in Crimea, this region is less at risk for a covert territorial attack or conventional Russian aggression accompanied by gray zone activities.

In terms of Russia's interests, the Balkans are a lower priority than the near abroad, but remain an area where Moscow desires to at least maintain—if not expand—its sway and curb Western influence.[18]

Page 397 of 3957

Page 398 of 3957

Consequently, Russia aims to prevent any further encroachment of Western multilateral organizations, but their expansion into this region is not seen as an existential threat unless it is tied to particular initiatives, such as missile defense.[19] Russia might also view the region, which includes many of the newest and most vulnerable members of NATO and the EU, as an opportunity for undermining Western consensus by exposing the weaknesses of these new members and testing the West's ability to support them.

Finally, Western and Central European states are the least vulnerable to Russian gray zone tactics and are outside Russia's desired sphere of influence. These states are characterized by strong government institutions, relatively low corruption, general prosperity, and strong and independent media. Nevertheless, Moscow undertakes everyday gray zone actions throughout this region, because although they have the worst odds of succeeding, they also offer the highest potential payoff should they weaken a long-standing NATO or EU member's commitment to European unity. By dividing these organizations, Russia could also undermine the economic sanctions put in place against it after its invasion of Ukraine. Moreover, there are fissures in many Western and Central European states that Russia could potentially exploit—most notably, the immigration crisis, widespread dissatisfaction with the EU, and concerns about terrorism. Moscow has also curried favor with several populist and right-wing parties that promote nationalist, anti-integration agendas, such as Le Pen's National Rally in France.[20]

Page 398 of 3957

CHAPTER SEVEN

Civilian Organizations, Rather Than the Military, Might Be Best Positioned to Counter Most Russian Gray Zone Tactics

NATO and its member states' armed forces have focused considerable attention on countering Russian gray zone actions. Clearly, there is an important role for the military in deterring high-order aggression, whether it is attempted through purely gray zone tactics or through conventional means—which almost surely will be coupled with gray zone activities—but the vast majority of Russian gray zone activities are not geared toward territorial gains, but instead are everyday operations seeking to enhance Russia's influence through nonmilitary means. In short, our research suggests that the fight against gray zone activities is primarily a social, political, and economic fight—not a military one. Our games illuminated this observation. Many of the Blue and Green teams in our games argued that this fight is better waged by civilian agencies and NGOs, whose core competencies lie in these domains. These players observed that the most effective countermeasures available to the Blue and Green teams were not military actions, but rather actions taken by the U.S. Department of State, ministries of foreign affairs or economy, or the United States Agency for International Development to strengthen governments and liberal institutions. These players viewed the military's role in countering Russian gray zone tactics as a supporting one, buttressing and reinforcing civilian activities, and something that needed to be included in a whole-of-government approach.

Page 401 of 3957

Moreover, the West should not simply react to Russian gray zone actions or try directly to counter them. Rather, the United States and Europe need to develop long-term strategies to address the underlying weaknesses in states that Russia's gray zone tactics try to exploit and build more resilient democratic societies that will be able to fend off these actions on their own.[1] This should include efforts to raise awareness about false news, strengthen independent journalism, improve media literacy, fight corruption, bolster the rule of law, and diversify Europe's energy sources to reduce Moscow's economic leverage, especially on less prosperous countries.

The military plays an important but limited role in countering Russian gray zone activities by improving cyber defenses, enhancing intelligence and counterintelligence capabilities, and building partner special forces capacity so that allies can independently and effectively respond to any Russian covert infiltrations. Additionally, to improve responsiveness, the United States should encourage collaboration between law enforcement and the military, so that intelligence can be shared in a timely fashion and to ensure that a country has clearly delineated the roles and responsibilities of different government organizations in the event that Russia employs violent gray zone tactics.[2] In general, however, security force assistance, especially targeting general-purpose forces, should be a lower priority than efforts to strengthen civilian government institutions, the media, and civil society when seeking to counter gray zone tactics. NATO and its member states' armed forces should remain focused on bolstering conventional and nuclear deterrence while enhancing crisis stability, not on Russia's gray zone tactics.

CHAPTER EIGHT

The West Might Be Winning This Competition, but Does Not Recognize It

Although many question whether Russia would ever overtly attack the Baltics or any NATO member, few disagree with the contention that Russia takes gray zone actions against nations in Europe and the United States on a daily basis.[1] These everyday Russian gray zone operations have caused concern verging on the point of panic and defeatism in some parts of Washington and Brussels.[2] These sentiments seem mostly to stem from the idea that the West cannot stop Russia from using gray zone activities; therefore, it is somehow *losing*. These sentiments—echoed by many players in our games—neglect an evaluation of the larger strategic situation. Our games provided important insights on this point.

Generally, players agreed that it is very difficult to decisively prove what effect everyday gray zone tactics have had in a myriad of countries. At this time, the only conclusion we can reach is that Russia has been actively interfering in electoral contests; there is no conclusive

Page 402 of 3957

Page 403 of 3957

evidence, however, that those efforts affected the outcomes.[3] After the French public was alerted to the fact that Russia was backing Le Pen, Moscow's gray zone tactics might have even backfired, contributing to a decisive victory for Emmanuel Macron.

By stepping back and taking a wider look at the situation, it appears that the West might *not* be losing. Russian gray zone tactics are now the normal state of affairs.[4] After one game, a player observed that the West cannot force Russia to desist in these actions, but it is far from clear that they are having much effect. Russia's largest victories—in Crimea and the perhaps Pyrrhic victory in the Donbass—have combined gray zone techniques with more traditional applications of military power, but these outcomes are the exception—not the norm.[5] Moreover, in the Donbass, gray zone tactics alone did not bring victory, and now Moscow is bogged down in an increasingly costly war against a determined Ukrainian resistance. At the same time, the Russian economy is in the midst of an economic crisis exacerbated by the international sanctions put in place after its offensives in Ukraine. More significantly, Russia's offensives in Crimea and the Donbass have unified and galvanized Europe in a way that was unimaginable only four years ago. In that short time span, NATO has gone from shrinking and consolidating its military posture to expanding it, pushing forces farther eastward in an effort to bolster the defenses of the Baltic states. As one of the Blue players observed, Russia's gray zone aggression in Crimea and conventional offensive in eastern Ukraine have succeeded in preventing Ukraine from entering the EU, but have reignited a strategic competition with the West, which Russia is not winning and, in the long term, cannot win.[6]

[5] Mazarr, 2015, p. 121.

[6] Russia has several key weaknesses, most notably its economy, its demographic issues, and its authoritarian kleptocratic regime. Joss Meakins, "Why Russia Is Far Less Threatening Than It Seems," *Washington Post*, March 8, 2017. For a contrary perspective which argues

Page 403 of 3957

Page 404 of 3957

Just because Moscow has not gained a significant advantage with its gray zone activities to date does not mean that the West should ignore these Russian actions. The United States and its European allies need to take steps to strengthen their defenses against gray zone tactics and to improve their ability to identify when Russia is shifting from everyday gray zone tactics to a more targeted campaign. Even the strongest states need to combat "truth decay"—which Russian gray zone tactics contribute to—by expanding awareness about disinformation and teaching how to distinguish facts from fiction.[7] Additionally, they should shore up defenses by addressing critical cyber vulnerabilities. These steps will not entirely stamp out Russian gray zone actions, but by addressing critical vulnerabilities, they will increase the ability of a society to withstand them. The EU and NATO also need to work to strengthen the resiliency of weaker states by building democratic, civilian institutions and an independent media, both of which are the most vulnerable targets of gray zone aggression.[8]

In short, just because the West might be ahead in this competition does not mean that it can ignore gray zone aggression. At the same time, however, the United States and its European allies should not overreact. Russia's greatest tactical successes largely depended on its conventional military forces, not the gray zone tools that supplemented them.[9] High-order aggression is something that can be stopped through conventional deterrence. If Washington and Brussels focus most of their efforts on stopping Russian social media trolls, countering each false news story, and promoting their own strategic narrative,

---

that Russia's strategy of raiding could succeed, see Michael Kofman, "Raiding and International Brigandry: Russia's Strategy for Great Power Competition," *War on the Rocks*, June 14, 2018.

Russian gray zone activities could turn into a cost-imposing strategy that distracts the West from the main competition. If NATO wants to deter Russian aggression, whether it uses gray zone tactics or not, it should put in place sufficient military capabilities to stop Russia from quickly achieving its objectives when the gray zone threatens to turn red.

Russia's gray zone tactics will persist and should be countered by hardening Western societies against Russian propaganda and its disinformation and attempts to undermine democracy. However, overreaction only serves Moscow's purposes. Strong civil societies and robust democratic institutions, not panic at "losing" or attempts to fight Russia blow-by-blow, are the West's best defenses against Russia's gray zone tactics. Russia's gray zone tactics signify its weakness, and the West's stronger political, cultural, and social systems will prevail over them if given the chance.

APPENDIX

Wargaming the Gray Zone

The research documented in this report is drawn from a series of war games developed and conducted to explore a gray zone competition in Europe. These games were held between October 2016 and December 2017 and played by SMEs in Europe, Russia, and the United States.

Three distinct strategic political-military games were designed to conduct this research. The first game was a loosely structured argument-based matrix game and the next two games were card-driven games that differed in structure. All three games allowed players to take actions across different domains, with an emphasis on information, economic, military, and political-social actions. The scope of these games was varied as well, with the first two games allowing for free play within Europe and the last game limited to the Western Balkans. This final game built on the previous two games and incorporated insights derived from the earlier exercises to develop a tightly scoped and structured strategic level card-driven game.

The loose structure and seminar-style nature of the matrix game proved to be ill-suited to representing the nature of a gray zone competition, but helped us to identify key issues that merited further exploration. Because the variety of possible gray zone activities seemed limitless, the players were overwhelmed by the choices. Without a gaming platform to bound and focus the discussion, the players tended to fixate on covert tactical actions instead of the strategic competition. We initially attempted to provide more structure through simply adding cards that served as a menu for Blue, Red, and Green actions, but this proved disappointing as well, because it did not provide the players with the appropriate level of strategic feedback about the outcomes of their decisions. Free play within all of Europe further compounded the

Page 406 of 3957

Page 407 of 3957

problem because unconstrained geography impeded the players' efforts to develop a strategy and resulted in a deluge of unconnected actions that inundated the adjudicators and interfered with learning.

Ultimately, we developed a three-sided card-driven board game focused on Russian, American, and European gray zone actions in the Western Balkans. At first blush, our gray zone game looks similar to commercial games, such as Twilight Struggle.[1] The game consists of two game boards (seen in Figures A.1 and A.2)—a game timeline where players made their short- and long-term actions by laying down their cards, and the other illustrating the state of play in the Balkans, including key country-level information and larger metrics of success, including NATO unity and Russian regime stability.

Cards provide a starting menu of actions that the Russia, Europe, and U.S. teams could play overtly or covertly (i.e., playing the card face-down) on the game timeline board. In spite of this structure, the gray zone game was also constructed to maximize its flexibility so that the players could amend the provided cards, create new cards, and develop their own narrative by expanding on the cards and overtly messaging to partners and adversaries alike. Adjudication of these actions used a simple model that reflected our best understanding of how and why gray zone tactics succeed or fail. To inform the development of this model, we surveyed the empirical record on Russian gray zone tactics and the existing literature on the individual actions that are considered to be a part of gray zone activities (e.g., information warfare, covert action). Based on this literature and SME elicitation, we created combat results tables and probabilistically assigned outcomes to different gray zone tactics. The purpose of the structured adjudication, however, was not to predict what could or will happen in the real world. Rather, it is to focus the discussion and to allow for the systematic exploration of Red gray zone actions and Blue and Green countermeasures. Moreover, with the exception of covert actions, adjudication was done transparently, so the players could understand the outcomes and argue with the control team if the adjudication seemed off. If the white cell, or game adjudicators, were persuaded by these arguments, they would amend the rules in real time.

MEETING THE ESPIONAGE CHALLENGE: A REVIEW OF UNITED STATES COUNTERINTELLIGENCE AND SECURITY PROGRAMS

OCTOBER 3 (legislative day, SEPTEMBER 23), 1986.—Ordered to be printed

Mr. DURENBERGER, from the Select Committee on Intelligence, submitted the following

REPORT

I. INTRODUCTION AND SUMMARY

As espionage is ancient, so is counterintelligence. The Chinese military theorist Sun Tzu stated the principle in the fourth century B.C.: "It is essential to seek out enemy agents who have come to conduct espionage against you. . . ." [1] Today, over two millenia later, the battle is still being waged.

A. BACKGROUND

At the beginning of the 99th Congress, the Select Committee on Intelligence initiated a comprehensive review of the capabilities of U.S. counterintelligence and security programs for dealing with the threat to the United States from Soviet espionage and other hostile intelligence activities. This decision was an outgrowth of eight years of Committee interest in these issues. The review is also consonant with the Committee's mission to "oversee and make continuing studies of the intelligence activities and programs of the United States Government, and to submit to the Senate appropriate proposals for legislation and report to the Senate concerning such intelligence activities and programs." Senate Resolution 400, which established the Committee ten years ago, specifies that intelligence activities include "activities taken to counter similar activities directed against the United States."

The Committee's review had barely begun when the arrests of John Walker and two of his relatives began to make 1985 the "Year of the Spy." In June, 1985, the Committee pledged that it

[1] Sun Tzu, *The Art of War*, trans. by Samuel B. Griffith, Oxford University Press (London: 1963), p. 148.

Page 428 of 3957

would prepare a report to the full Senate at the earliest possible time. In light of this Committee's ongoing efforts, the Senate decided not to create a National Commission on Espionage and Security. On June 20, 1985, the Chairman of the Committee wrote to the President, saying, "You and we share an historic opportunity—both to dramatically improve U.S. counterintelligence and security and to demonstrate how Congress and the Executive can work together to achieve progress in sensitive intelligence areas."

The ensuing fifteen months have generated an amazingly sustained interest in counterintelligence and security on the part of both policymakers and the public. There have been over a dozen arrests for espionage, nearly all leading to guilty pleas or verdicts; Americans and West Germans with sensitive information have defected to the Soviet Union and East Germany; and Soviets with sensitive information have defected to the West, and in one major case then returned to the Soviet Union. Most recently, the Soviet arrest of an innocent American journalist in retaliation for the U.S. arrest of a Soviet U.N. employee has made it clear that counterintelligence, while seemingly a peripheral element in superpower relations, can even become the focus of U.S.-Soviet confrontation.

The "Year of the Spy" was characterized by intensive Executive branch attention to problems of counterintelligence and security. Of particular note were the efforts of the Department of Defense Security Review Commission, chaired by General Richard G. Stilwell, USA (retired), and the Secretary of State's Advisory Panel on Overseas Security, chaired by Admiral Bobby R. Inman, USN (retired) and Executive branch steps to implement their recommendations. The Stilwell Commission led to significant progress in Defense Department personnel and information security policies, and the Inman Panel led to restructuring of State Department security functions and a major embassy rebuilding program around the world.

The Committee's efforts have encouraged, and have greatly benefitted from, this sustained Executive branch attention to counterintelligence and security matters. The Committee received an unprecedented level of cooperation from the President, the National Security Council staff, the Intelligence Community Staff, and the many departments and agencies with counterintelligence or security functions. Executive branch experts and policymakers testified in sixteen closed hearings on specific counterintelligence cases and the current state of U.S. programs to counter hostile intelligence activities. Scores of staff briefings and the provision to the Committee of many sensitive Executive branch studies enabled the Committee to compile the very best ideas and recommendations of those in government, as well as suggestions from security experts in industry. The Committee, in turn, evaluated those ideas and submitted a comprehensive set of recommendations for Executive branch consideration.

The Intelligence Authorization Act for FY 1986 included a statutory requirement that the President submit to the House and Senate Intelligence Committees a report on the capabilities, programs and policies of the United States to protect against, detect, monitor, counter and limit intelligence activities by foreign powers,

Page 430 of 3957

within and outside the United States, directed at the United States Government. The report was to included plans for improvements that the Executive branch has authority to effectuate on its own, and recommendations for improvements that would require legislation. To assist the Senate Intelligence Committee in its work, the conferees on the Act requested an interim report developed in consultation with the Intelligence Committees. This Committee, in turn, prepared its own interim report, which it shared with the Executive branch last winter.

The many good ideas and recommendations that the Committee obtained from Executive branch officials and studies had not yet been implemented for two basic reasons: counterintelligence and security had failed to receive sustained attention; and the ideas frequently challenged established ways of doing things, cut across bureaucratic lines of responsibility, or required substantial changes in resource allocation. External events provided substantial impetus for interagency attention to these issues. The Committee's efforts and the Executive branch's cooperation are producing the interagency decision-making that is required for progress.

The President began, responding to a request from the Committee, by designating the Director of Central Intelligence to represent the Administration at a series of Committee hearings on counterintelligence and security programs and selecting a counterintelligence expert on the NSC staff as liaison to the Committee. An interagency mechanism under the Senior Interdepartmental Group for Intelligence (SIG–I) supplied coordinated Executive branch reactions to the Committee's interim report recommendations. This not only helped the Committee, but also gave the Executive branch itself the opportunity to address and decide these important policy issues. The resulting positions were conveyed to the Committee in the President's interm report and referred to an NSC staff committee for implementation.

The President's interim report and subsequent consultation between Executive branch officials and the Committee were thus of great value in the preparation of the present Report. The Committee looks forward to receipt of the President's final report, which will serve as an important benchmark of the progress achieved thus far to strengthen counterintelligence and security capabilities.

The summary that follows is based upon the Committee's unclassified public Report. The Committee's full Report to the Senate contains substantial additional material, including findings and recommendations that remain classified.

B. ORGANIZATION OF THE U.S. GOVERNMENT TO MEET THE HOSTILE INTELLIGENCE CHALLENGE

The Committee's findings underscore a fundamental challenge to the nation. The hostile intelligence threat is more serious than anyone in the Government has yet acknowledged publicly. The combination of human espionage and sophisticated technical collection has done immense damage to the national security. To respond to the threat, the United States must maintain effective counterintelligence efforts to detect and neutralize hostile intelligence oper-

Page 430 of 3957

ations directly, and defensive security countermeasures to protect sensitive information and activities.

The Committee believes that, as a result of significant improvements in recent years, the nation's counterintelligence structure is fundamentally sound, although particular elements need to be strengthened. The Executive branch and the Committee agree on the importance of developing and implementing a coherent national counterintelligence strategy that integrates the work of the FBI, the CIA and the Departments of State, Defense and Justice. Executive branch agencies are already drafting such a document. The Committee expects this strategy to play a major role in its oversight of Executive branch counterintelligence efforts in the years to come.

By contrast, defensive security programs lack the resources and national policy direction needed to cope with expanding hostile intelligence operations. Personnel security policies remain fragmented despite persistent attempts to develop national standards. Information security reforms are long overdue. America faces vulnerability to hostile intelligence activities in the areas of communications and computer security, where countermeasures must keep pace with increasing technological change. Consequently, in December, 1985, the Committee called for the development of a National Strategic Security Program that would address these issues. The Committee believes that a new and more permanent national policy mechanism is needed to create this program and then to coordinate and foster the protection of information and activities having the greatest strategic importance.

In recent months, the Executive branch has come to understand the sense of urgency with which the Committee views the need for an integrated strategic security program and an improved security policy structure. An effort to develop such a security program is now likely. The Director of Central Intelligence, in his capacity as chairman of the Senior Interdepartmental Group for Intelligence, recently revamped the security committee structure under the SIG–I and called for greater participation in those committees by policymakers, so that decisions could be reached on interagency issues and policy initiatives.

The Committee believes that these changes are insufficient because they fail to bridge the gaps between the various security disciplines. Most Executive branch officials, although opposing further changes at this time, do not dispute the likely need for them in the future. The Committee will continue to push for more effective policy review and formulation, for it believes that the national security cannot afford much more delay. This is especially true if the current Administration is to leave as a legacy a workable security policy system that will not have to be reinvented by each succeeding administration. The Committee recommends that the eventual new security policy structure be one that transcends current politics and policy and is codified in an Executive Order.

C. COUNTERINTELLIGENCE: LEARNING THE LESSONS OF RECENT CASES

The Committee has examined in detail each of the espionage cases that have come to public attention in recent years, as well as

the Yurchenko defection case and cases that remain classified. Although this Report does not discuss individual cases in detail, many of the recommendations in sections III and IV reflect lessons learned through those cases.

The first lesson of these cases is the need for greater counterintelligence and security awareness. The Committee found insufficient tailoring of security awareness material to the needs of particular audiences—defense contractors, workers at government facilities, U.S. personnel stationed overseas, members of ethnic groups known to be targeted by foreign intelligence services, congressional staff and others. The usefulness of such material is illustrated by the fact that once the U.S. Navy began to improve its security awareness briefings after the Walker case, co-workers of Jonathan Pollard noted his unusual pattern of document requests and alerted authorities.

The second lesson is the need for earlier involvement of the FBI and the Department of Justice in cases of suspected espionage. When offices or agencies have held back from bringing in the FBI, events have often gotten out of control. When the FBI has been alerted in time, their investigative resources and interview skills have often led to confessions. When the Justice Department has been involved at an early stage, cases destined for prosecution have been built on more solid ground, resulting in numerous convictions.

The third lesson is the need for more attention and better access to information on the finances, foreign travel and foreign contacts of persons with sensitive information. The Committee found that the FBI sometimes lacked access to financial and telephone records in its counterintelligence investigations; that insufficient attention was given to signs of trouble regarding former employees with sensitive accesses; and that too few people were alerting office security personnel or the FBI when they were approached by possible foreign intelligence officers.

The Chin, Pollard and Scranage cases have taught the clear lesson that espionage services outside the Soviet bloc also engage in illegal activities targeted at the United States, which must not be tolerated. The Bell and Harper cases, among many, underscored the need for controls on the activities of certain Eastern European representatives and of U.S. companies controlled by the Soviet Union or its allies. And the Zakharov case, like the Enger and Chernyayev case eight years ago, reminds us that the KGB is willing to use the United Nations Secretariat for intelligence cover.

The Edward Lee Howard case led to investigations and corrective action in the CIA, just as the Walker case led to formation of the Stilwell Commission and to additional steps by the U.S. Navy. The FBI and the Justice Department are still absorbing the lessons of the Howard case. The Committee will continue to monitor how well all the agencies implement improvements in response to those lessons.

The defection and re-defection of Vitaly Yurchenko, which highlighted both the counterintelligence value of defectors and apparent shortcomings in their handling and resettlement, also led to internal reviews and useful actions by the CIA to improve its handling of defectors. The Committee believes that more must be done, however, to change the basic objectives with which the U.S. Gov-

ernment approaches defectors. We must accept the obligation to help defectors succeed in, and contribute to, American society. Executive branch efforts to analyze and learn from the Yurchenko case continue, and the Committee expects to see more progress in this area.

The CIA has taken significant steps to improve recruitment and career development programs for counterintelligence personnel. The Scranage and Howard cases suggest that there was, and is, substantial need for improvement in CIA counterintelligence, and the Committee will continue to monitor CIA efforts. The military services and the FBI are also beginning to improve their recruitment and career development programs for counterintelligence, but progress is uneven.

The Committee will continue to press Executive branch agencies to incorporate into their operations improved counterintelligence awareness and procedures. While agencies have moved in the last year to remedy problems that were exposed in recent espionage cases, they have been much slower to accept the painful need to confront the implications of hostile intelligence successes. Attentiveness to possible hostile knowledge of classified U.S. operations must be increased, and analysis of the impact of known losses of classified information must extend to the unhappy possibility that operations or weapons systems will require modification. While there is always a need not to let worst-case analyses paralyze our military and intelligence services, the greater current danger appears to be a wishing away of the consequences of hostile intelligence efforts.

D. SECURITY COUNTERMEASURES: DEFENDING ON MANY FRONTS

The National Strategic Security Program that the Committee recommends will have to address a multitude of issues, cutting across both agency and disciplinary lines. Thus, different agencies have failed for years to agree upon the scope and methods to be used in background investigations for Top Secret and Sensitive Compartmented Information clearances; the result has been wasteful duplication of investigations. Military services, in particular, have been permitted to establish far too many special access programs, all in the name of security but sometimes with lower security standards than the regular programs maintain. Technical experts who run our nation's computer security programs have poured additional funds into specially-designed hardware and software to protect sensitive computer systems, while doing little to combat the major personnel problem of assuring the reliability of computer users with access to so much sensitive data. The various agencies that deal with technical security issues have only recently begun to forge effective cooperation on approaches to those issues. And this country has a long way to go in the development of operations security practices to protect sensitive programs against hostile intelligence collection activities.

This Report groups many security issues by discipline, but the Committee feels strongly that many, and perhaps most, of those issues will remain unresolved until a more effective security policy structure is implemented. There is a need to upgrade security

Page 434 of 3957

across the board, with improved recrutiment, improved training of personnel ranging from security clearance adjudicators to polygraphers and technical security personnel, and upgraded job classifications that reflect the increased importance and sophistication of modern security specializations.

In the field of personnel security, the Committee found, as did the Stilwell Commission, that insufficient attention was being paid to the reinvestigation of those who already have security clearances. Both the Defense Department and the intelligence community now understand the importance of reducing the backlog in those reinvestigations, and the Committee has worked to ensure that the needed funds to accomplish this swiftly are provided in legislation. One reason for recommending interagency agreement on a "single scope" background investigation is the hope that funds thus saved could be put to work on the pressing reinvestigation task, as well as on upgrading Secret clearance investigations as recommended by the Stilwell Commission. The Defense Department has reduced the number of cleared personnel by some 900,000 persons—over 20%—thus also easing some of the clearance investigation costs.

There is a crisis of standards in sensitive governmental positions. The Committee found no rigorous standards regarding the hiring of persons who have committed felonies. Follow-up measures after persons with admitted problems like past drug use are granted clearances are poor or nonexistent. Even the most sensitive clearances are granted to virtually anyone whose record does not contain clear disqualifying factors, rather than being based upon a selection process that chooses those persons most able to cope with the pressures of sensitive access and security. In light of this, the Committee has supported Defense Department efforts to develop counterintelligence polygraph programs with the highest quality controls, pursuant to the test program approved by the House and Senate Armed Services Committees.

The Committee has found that the classification system is unduly complicated and that it breeds cynicism and confusion in those who create and use classified information. The Committee believes that a streamlined system, in which the Confidential classification is eliminated and all information is either Secret or the equivalent of Sensitive Compartmented Information, would be much more workable despite the major changes and initial costs that this would entail.

The Committee also found that authorized (but uncontrolled) disclosures and unauthorized leaks of classified information are so commonplace as to imperil many sensitive programs and operations. Recent Executive branch efforts to investigate instances of unauthorized disclosure of classified information and to punish those responsible are a welcome development. The Committee calls on the Executive branch to go further, however, and to adopt procedures governing authorized disclosures, so that there will be a record of such disclosures—thus relieving the FBI of the need to investigate cases that are not real leaks—and so that those who originate classified information will have a chance to argue against its release. There must be both firmness and order in the information security system before it will gain the respect of the millions of people who handle classified information.

Page 434 of 3957

The Committee was pleased to learn of the National Security Agency's many efforts to improve the communications security of the U.S. Government. It supports NSA's plan for the development and licensing for distribution of low-cost secure voice telephone equipment. In addition, the Committee has proposed Fiscal Year 1987 funding to improve communications security by beginning the encryption of many domestic commercial communications satellite links.

The Committee endorses the role of NSA in developing computer security hardware, systems and standards for both the government and segments of the private sector, in cooperation with the National Bureau of Standards. The Committee recommends, however, increased attention to personnel security aspects of protecting computerized information. It supports State Department efforts to place U.S. citizens in charge of the computers in U.S. embassies overseas. The Committee believes that personnel with access to the most sensitive computer systems should be included in personnel reliability programs similar to those now being instituted for persons with sensitive cryptographic access. And it believes that there must be better analysis of information system vulnerabilities before permission is given to put sensitive information in those systems.

The Committee was very concerned over serious deficiencies in the security of U.S. facilities overseas, primarily those managed by the Department of State. The bugging of typewriters in the U.S. Embassy in Moscow graphically demonstrated both Soviet sophistication and U.S. vulnerabilities. Steps are being taken to combat technical penetration efforts, ranging from the embassy rebuilding program proposed by the Inman Panel to an equipment protection program that was funded in the Diplomatic Security Act. The Committee supports these and other efforts, and it has worked to ensure that agencies will work closely with each other to bring the best expertise to bear on technical security problems.

The Committee has also found the industrial security system for classified defense and intelligence contracts to be seriously deficient, to an extent that warrants consideration of major changes. The Committee recommends a pilot program to assign Defense investigative Service personnel to large sensitive contractor facilities on a full-time basis. It proposes changing the Federal Acquisition Regulations to make security a direct cost in contracts, rather than an overhead cost that is inevitably subjected to corner-cutting. It suggests greater incentives in contracts for security performance, as well as a requirement that security officers be trained and government-certified. Many of the Committee's recommendations regarding personnel and information security will also have a direct impact upon industrial security practices.

Attention to security requirements is also needed in Congress itself. The Committee found that there was no centralized registry of Senate personnel with clearances, little or no security awareness material for Congress, and little understanding of how to protect sensitive information that is provided to Member offices and committees. At the request of the Majority Leader, the Committee joined with the Committee on Rules and Administration and the Committee on Governmental Affairs in recommending that a

Senate security office be established to develop and oversee implementation of standards and procedures in these areas. The Committees recommended that the security office be instructed to survey the extent of clearances among Senate staff, to recommend how the number of cleared personnel might be reduced, and to develop a Senate security manual, the provisions of which would be binding on all Members, Officers and employees of the Senate. The Committee continues to work closely with Senate leadership on these efforts, with a goal of creating a security office early in the next session.

E. BUDGETARY IMPACT

The Committee's recommendations will not be cost-free. Some savings would be achieved through streamlining the classification system, adopting common standards for background investigations, and implementing current national policies that lessen the requirement for TEMPEST protection of U.S.-based information-processing equipment. But the Committee believes that the U.S. Government has suffered for years from inadequate investment in security countermeasures.

In the Intelligence Authorization Act for Fiscal Year 1987, the Committee has proposed substantial increases in spending for security in the intelligence community and in related Defense Department programs. Among these initiatives are an additional $129 million for communications security, including the first year of a five-year plan to encrypt sensitive domestic communications satellite channels, and an additional $22 million to improve personnel security in the Defense Department. In 1985, Committee members proposed what became a $35 million supplemental appropriation for improved technical security at U.S. facilities abroad. In 1986, the Congress passed the Diplomatic Security Act and a supplemental appropriation providing funds for a massive program to upgrade security at U.S. missions. This commitment is designed for protection against not only terrorism, but also hostile intelligence penetration.

The additional expenditures recommended by the Committee for FY 1987 would amount to an increase in annual spending for counterintelligence and security of at least $500 million above the funding level in FY 1985. This commitment must continue in the years ahead, when further increases may well be required because of the growing technical, communications and computer security vulnerabilities. From a larger perspective, however, the costs of improved security will be offset by the gains to the United States in the overall U.S.-Soviet balance of military, intelligence, economic and political capabilities. Soviet espionage successes have cost our country or saved our adversaries billions of dollars. Just as our nation's investment in intelligence-gathering programs has a significant payoff for national security, an increased investment in counterintelligence and security programs will help deny comparable advantages to the Soviets.

F. LEGISLATIVE PROPOSALS

The great majority of the Committee's findings and recommendations relate to administrative actions. Some needed actions do require, however, legislative authorization. In these cases, the Committee has either recommended or, often, already introduced the needed legislation.

Members of the Committee have sponsored several pieces of legislation in recent years to bring the hostile intelligence presence in the United States under some control. The Committee recommends that these be implemented so as to maintain a limit of 320 on permanently accredited Soviet embassy and consular personnel. The Committee also found gaps in current legislation and recommended three further steps: a legislated policy of equivalence between the U.S. and Soviet U.N. missions (introduced by Senators Leahy and Cohen as S. 1773); registration of commercial entities controlled by Warsaw Pact governments (introduced by Senator Roth as S. 1900); and extension of the Foreign Missions Act to include commercial and other entities controlled by foreign governments (introduced by Senators Durenberger and Leahy as S. 1947). All three proposals have been attached to the Intelligence Authorization Act for Fiscal Year 1987.

The FBI could benefit greatly from legislation in several areas. The Committee has added provisions to the Intelligence Authorization Act for Fiscal Year 1987 that would require banks and telecommunications companies to comply with FBI requests for access to customer records pursuant to duly authorized full counterintelligence investigations. State privacy laws and fears of civil suits have inhibited some companies from cooperating with the FBI in recent years. The Committee is also prepared to introduce legislation to create a court order system, comparable to that which now exists under the Foreign Intelligence Surveillance Act, to authorize physical searches for couterintelligence purposes. This would avert the need to rely on assertion of inherent Presidential powers in this area and would make it easier to use material thus obtained in eventual prosecutions.

The FBI has a problem in providing sufficient financial incentives to its Agents who must work in New York City, which in turn makes it difficult to retain counterintelligence specialists in that Field Office for substantial periods of time. If the FBI determines that legislation is required to address this problem, the Committee is prepared to work with the FBI to develop a suitable legislative approach.

The Committee recommends that the FBI and the Justice Department develop improved means of prosecuting foreign intelligence officers or agents who enter the United States illegally or under non-official cover and who engage in intelligence support functions without actually passing classified information. This could result in legislative proposals in the next Congress.

Although the Committee has not recommended legislation regarding assistance to defectors, it is quite possible that the Permanent Subcommittee on Investigations of the Committee on Governmental Affairs will make such recommendations when it completes

Page 438 of 3957

its inquiry into that matter. The Intelligence Committee expects to work closely with the Permanent Subcommittee on this issue.

The Committee supports recent Defense Department efforts to develop a counterintelligence polygraph program with strict quality controls, modeled on the Air Force's successful Seven Screens program. The Committee recommends that the Armed Services Committee either propose legislation to establish a permanent authority for this polygraph effort or extend the current test program under which DoD is operating and set a date by which the issue of permanent authority will be decided.

Deficiencies in congressional security have prompted the Committee, in conjunction with the Committees on Governmental Affairs and Rules and Administration, to propose that the Senate establish a Senate security office with responsibilities in the areas of personnel and information security. The office would be established by Senate Resolution.

The Committee has not recommended any legislation at this time to deal with the unauthorized disclosure of classified information. It believes that consideration of this issue should be postponed until appeals are completed in the *Morison* case and the applicability of the federal espionage statutes to leaks and other disclosures has been decided. In addition, the Committee believes that there are significant administrative steps that can and ought to be implemented more quickly, in particular the adoption of procedures to govern the authorized disclosure of classified information.

G. RESPECT FOR INDIVIDUAL RIGHTS

A free society cannot allow the fear of foreign adversaries to undermine the constitutionally protected rights that define the true character of our nation. This principle has guided the Committee in its review of counterintelligence and security programs. As President Reagan stated on June 29, 1985:

> [W]e can counter this hostile threat and still remain true to our values. We don't need to fight repression by becoming repressive ourselves. . . . But we need to put our cleverness and determination to work and we need to deal severely with those who betray our country. We should begin by realizing that spying is a fact of life and that all of us need to be better informed about the unchanging realities of the Soviet system. . . . There is no quick fix to this problem. Without hysteria or finger pointing, let us move calmly and deliberately together to protect freedom.

The Committee's recommendations seek to strengthen U.S. counterintelligence and security measures without violating constitutional rights or upsetting the delicate balance between security and freedom. A broad range of improvements can be made without adversely affecting the rights of individuals, and the additional tools needed for counterintelligence and security purposes can be made subject to reasonable safeguards that minimize intrusion into the privacy of American citizens.

Page 438 of 3957

II. The Hostile Intelligence Threat

The hostile intelligence threat to the United States is severe, and it confronts the Government and the American people with increasingly serious challenges. The threat spans all types of intelligence operations from traditional human espionage to the most sophisticated electronic devices. Every kind of sensitive information is vulnerable, including classified government information, emerging technological breakthroughs and private financial transactions. Foreign intelligence services also sometimes target the political process, seeking both information and influence.

What has made the threat more vivid to the Congress and the public are the many espionage cases that surfaced publicly in the last few years. During 1984–86, twenty-five people have been convicted or have pleaded guilty to charges of spying against the United States. Another person charged with espionage, Edward Lee Howard, has defected to the Soviet Union; a Soviet employee of the United Nations has pleaded "no contest" to espionage charges; and several foreign diplomats have been detained and/or ousted because of their espionage activities. The upsurge in espionage prosecutions began in the late seventies; and FBI Director William H. Webster said in 1984 that the espionage cases that came to public attention were "merely the tip of the iceberg." The Committee believes it is vital for the Senate and the public to be aware of the full dimensions of the threat, technical as well as human.

A. Damage to National Security

National policymakers must recognize as clearly as possible the extent and gravity of the damage to national security interests caused by hostile intelligence operations. Based on the public and classified record, the Committee has found the aggregate damage in recent years to be far greater than anyone in the U.S. Government has yet acknowledged publicly. The Committee has reviewed the actual and probable injury resulting from recent espionage cases, technical security compromises and technology transfer. The inescapable conclusion is that the damage was immense:

U.S. military plans and capabilities have been seriously compromised;

U.S. intelligence operations were gravely impaired;

U.S. technological advantages have been overcome in some areas;

U.S. diplomatic secrets were exposed to the scrutiny of our adversaries; and

Sensitive aspects of U.S. economic life were subject to constant Soviet monitoring.

Foreign intelligence services have exploited human and technical vulnerabilities to penetrate some of the most vital parts of our defense, intelligence and foreign policy structure, including many Executive branch agencies and the Congress. A sober examination of the damage is essential to make rational decisions on policy initiatives and resources allocation for counterintelligence and security programs.

In assessing the military damage, the Committee agrees with an estimate by a senior FBI official that the espionage cases over the

Page 440 of 3957

past several years have involved billions of dollars of actual and potential damage to U.S. military programs. The cases primarily include John Walker and Jerry Whitworth, James Harper, William Holden Bell, Thomas Cavanagh, Christopher Cooke and Ernest Forbrich.

Walker-Whitworth

Although the assessment in the Walker and Whitworth cases is still incomplete, their information may have enabled the Soviets to read some of the U.S. Navy's most secret messages to the fleet from the 1960's to the time of their arrests in 1985 and also possibly reduced the U.S. lead in anti-submarine warfare. The cryptographic material passed by John Walker and Jerry Whitworth was exceptionally harmful, because the Soviets could use it to decipher encrypted U.S. Naval communications. Vitaly Yurchenko, the Soviet KGB defector who later returned to the Soviet Union, told U.S. authorities that the Soviets read over a million coded messages as a result.

(An official assessment of the damage, prepared by the Director of Naval Intelligence and a senior Justice Department official, is provided in Appendix A.)

Harper

In 1979–81 James Harper passed to Polish intelligence a huge array of materials pertaining to the survivability of the Minuteman missile system and to U.S. defenses against ballastic missile attack. He obtained the information from a private firm doing contract research for the U.S. Army Ballistic Missile Defense Advanced Technology Center in Huntsville, Alabama. Harper received approximately $250,000 for documents whose loss Army experts have rated as "beyond calculation." He also provided computer data-base tape available through his contacts in Silicon Valley. Harper's largest single delivery occurred in 1980, when he took some 100 pounds of classified reports to Warsaw, where a team of 20 KGB experts flown in from Moscow declared them to be extremely valuable. KGB Chairman Yuri Andropov commended the Polish intelligence unit handling Harper for its efforts. (An account of the Harper case prepared by the Defense Security Institute is provided in Appendix B.)

Bell

William Holden Bell was recruited by a Polish intelligence officer operating under commercial cover. As a project manager in the Advanced Systems Division, Radar Systems Group at Hughes International Corporation, Bell was responsible for development and promotion of the radar fire control product line of tank vehicles. From 1978 to 1981, Bell supplied Polish (and presumably Soviet) intelligence extensive classified documents on the Covert All-Weather Gun System [CAWGS], a proposed tank gun using Low Probability of Intercept Radar [LPIR] or "quite radar." LPIR uses a disguised radar signal that is difficult for enemy targets to identify as radar; an enemy is thus prevented from taking evasive action or using the radar signal for directing return fire. (An account of the

Page 440 of 3957

Bell-Zacharski case prepared by the Defense Security Institute is provided in Appendix C.)

Cavanagh

The defense contractor case with the greatest potential for devastating harm involved Thomas Cavanagh, an engineer at Northrop Corporation. He was arrested in December, 1984, for attempting to sell classified documents on Stealth technology to the Soviets. The FBI intercepted his attempt, and FBI agents posing as KGB officers made the arrest after giving him $25,000 for the documents. While no serious compromise actually occurred, FBI Director Webster has said that Cavanagh's documents contained "the core of the Stealth technology" which had "cost this country over $1 million an hour to develop." (An account of the Cavanagh case prepared by the Defense Security Institute is provided in Appendix D.)

Cooke

Lt. Christoper Cooke, deputy commander of an Air Force Titan missile crew, was charged with passing classified information to the Soviets on U.S. strategic missile capabilities in 1980-81. While the damage was serious, the charge was dismissed because Air Force prosecutors had offered him immunity to find out if he was a part of a larger spy ring (which he apparently was not).

Forbrich

Ernest Forbrich, a West German auto mechanic, was arrested in 1984 in Florida after buying a classified military document from an undercover agent posing as an Army officer. Forbrich appears to have been a conduit who passed U.S. military secrets to East German intelligence, and he admitted selling documents to the East Germans for 17 years. Forbrich traveled frequently to the United States, contacting former U.S. military personnel who had served in West Germany. Although he was convicted of espionage, none of the former U.S. military personnel whom Forbrich contacted was charged.

The espionage damage to U.S. intelligence over the past decade has been as great as the harm to military programs. The cases that surfaced in 1985—Howard, Pelton, Chin and Pollard—represent a severe blow to U.S. intelligence, with Howard, and Pelton doing the greatest harm because they compromised collection efforts directed at high-priority targets in the Soviet Union. Other recent cases involved FBI Agent Richard Miller, Army counterintelligence specialist Richard Craig Smith, and CIA employees Sharon Scranage and Karl Koecher.

Howard

Edward Lee Howard, a former case officer dismissed by the CIA, was accused of selling intelligence secrets to the Soviets and subsequently defected to Moscow. Howard probably gave the Soviets information on sensitive CIA operations in Moscow.

Pelton

Ronald Pelton, a former communications specialist with the National Security Agency from 1965 to 1979, was convicted in 1986 of selling the Soviets information about a highly classified U.S. intelligence collection project targeted at the Soviet Union. Other aspects of the damage caused by Pelton that did not surface at the trial have not yet been completely evaluated.

Chin

Larry Wu-tai Chin gave the Chinese an inside view of U.S. intelligence reporting on China and related topics for decades, first as a translator for the U.S. Army and then as a translator and foreign media analyst for the CIA. Chin was a "plant" who received intelligence training before his employment by the Army in 1943. His reporting was highly praised by Chinese officials.

Pollard

Jonathan Jay Pollard, a civilian intelligence analyst with the Naval Investigative Service, pleaded guilty in 1986 to the charge of illegally passing classified documents to Israel. Pollard obtained a wide array of intelligence reports on the Middle East for his Israeli contacts.

Miller

FBI Agent Richard Miller injured the entire intelligence community, not just the FBI, when he provided the Soviets in 1984 (through his Russian emigre lover Svetlana Ogorodnikova) a document outlining overall U.S. foreign intelligence collection priorities.

Smith

Richard Craig Smith, a former Army counterintelligence agent, was charged in 1984 with selling information to Soviet agents in Tokyo identifying U.S. double agents being operated against Soviet intelligence. Smith was acquitted in 1986 after asserting as his defense that be had been working under the direction of CIA operatives in Honolulu.

Koecher

Karl Koecher, a naturalized U.S. citizen of Czech origin, worked as a translator for the CIA in the 1970s. He and his wife were arrested in 1984 as they prepared to fly to Switzerland. By then, the FBI had sufficient information to establish that Koecher was trained and sent to the United States in the 1960s to work as a Czech "illegal" and penetrate U.S. intelligence. Koecher was able to give Czech intelligence everything he knew about such sensitive CIA information as he was provided in his job as a translator.

Scranage

Sharon Scranage, a CIA operations support assistant in Ghana, was convicted in 1985 of turning over classified information, including the identities of CIA case officers and clandestine sources, to Ghanaian intelligence officials.

In addition to the damage to classified U.S. military and intelligence programs, hostile intelligence services have acquired sensitive technological data in the United States, Western Europe, Japan and elsewhere. Soviet acquisition of U.S. technology has significantly reduced the time it took the Soviets to develop new weapons systems and field countermeasures to U.S. systems. A recent example is the case of Manfred Rotsch, a Director of Planning for a prominent West German aerospace company, who was arrested as a Soviet agent. Rotsch was in a position to transfer detailed manufacturing information on Western weapon systems to the KGB, and the case points up the vulnerability of U.S. advanced technology released in coproduction or licensing programs. The research and development cost savings to the Soviet Union from illegal Western technology acquisition are believed to be enormous. The Ministries of Defense Industry and Aviation Industry alone are estimated to have saved half a billion rubles (roughly $700 million at official conversion rates) between 1976 and 1980, although that figure probably reflects operating cost savings as well as R&D.

In the diplomatic field the recent discovery of bugged typewriters in the U.S. embassy in Moscow exposed an operation of some duration. For years, the Soviets were reading some of our most sensitive diplomatic correspondence, economic and political analyses, and other communications.

More difficult to assess, yet with enormous danger to the United States, is the Soviet interception of U.S. communications from collection facilities throughout the world, including Soviet diplomatic establishments in the United States and an extensive site at Lourdes, Cuba. The Soviets could monitor many U.S. domestic telecommunications channels, including most satellite links and certain ground-to-ground transmissions. While the risk to military secrets from poor communications security is widely understood, the U.S. business community is also highly vulnerable.

Taken together, the damage to national security from espionage, technology theft and electronic surveillance amounts to a staggering loss of sensitive information to hostile intelligence services. As an open society, the United States already allows its adversaries unfettered access to vast amounts of information that must be shared widely so that our political system can function democratically and the process of free scientific inquiry can be most productive. Our openness gives hostile intelligence services the ability to focus their efforts on those few areas of our government and society where confidentiality is required.

The following discussion of the hostile intelligence threat to the United States is designed to give the Senate and the American people a better appreciation of the challenges we will continue to face in the future. It is based upon an assessment prepared by the intelligence community at the Committee's request. By understanding the nature and scope of ongoing hostile intelligence efforts, public officials and private citizens alike can better understand why the Committee recommends increased emphasis on counterintelligence and security programs. There is much that the ordinary citizen can do to strengthen the nation's defenses, especially if the individual works for the federal government, a government con-

Page 444 of 3957

tractor, or a high-tech industry or research program. The key requirement is knowledge of the dangers.

B. SOURCES OF THE THREAT

Among foreign intelligence services, those of the Soviet Union represent by far the most significant intelligence threat in terms of size, ability and intent to act against U.S. interests. In fact, the activities of the Warsaw Pact country and Cuban intelligence services are primarily significant to the degree that they support the objectives of the Soviets. The threat from intelligence activities by the People's Republic of China (PRC) is significant but of a different character, as explained below. The intelligence activities of North Korea, Vietnam and Nicaragua pose a lesser, but still significant, threat to U.S. foreign policy interests, although these countries have only a limited official presence in the United States.

Many other countries—hostile, allied, friendly and neutral—engage in intelligence operations against the United States. While these activities cannot be ignored, they do not represent a comparable threat. Nonetheless, in 1985, arrests for espionage included U.S. Government employees who had passed classified information to Israel and to Ghana.

1. Soviet Union

The KGB and the GRU are the two principal Soviet intelligence organizations. The KGB (or Committee for State Security) maintains internal security in the USSR and, as a secret intelligence service, collects intelligence and conducts covert political influence operations (termed "active measures") abroad. The GRU (or Chief Directorate for Intelligence) is the Soviet military intelligence organization and engages only in foreign intelligence activities.

In no other country in the modern world have intelligence and security services played such a crucial, long-term role in sustaining a government and controlling its citizens. In recent years, the KGB has become a vital tool for protecting the Communist Party at home and implementing its policies worldwide, especially through energetic espionage and covert action operations both against Western governments and in the Third World. (Covert action efforts are coordinated with the International Department of the Communist Party, which has lead responsibility for worldwide Soviet "active measures," including propaganda and political influence operations.) Soviet military intelligence came into its own during and just before World War II, and the GRU aggressively supplements the KGB with espionage and massive technical surveillance operations. The GRU coordinates and supports Soviet SIGINT and overhead photography and trains foreign revolutionary cadres and insurgents. In the operational Soviet military, "Spetsnaz" (Special Forces) units have an overseas role as special-purpose commando forces capable of covert infiltration, sabotage and assassination operations.

The highest Soviet collection priority is accorded to policy and actions associated with U.S. strategic nuclear forces. Other high priority subjects are key foreign policy matters, congressional intentions, defense information, advanced dual-use technology, and

Page 444 of 3957

U.S. intelligence sources and methods. The Soviets also target NATO intensively, partly as a means to obtain U.S. foreign policy and military information; recent arrests in West Germany and Greece are indicative of the successes of the USSR in targeting U.S. and NATO classified weapons systems.[2] The Soviets heavily influence the collection activity of the Cuban and Warsaw Pact services, in effect expanding their own collection resources through exploitation of the ethnic ties that other services can use in their recruitment efforts, as well as the normally less stringent U.S. controls on the activity of non-Soviet visitors and representatives.

The Soviets acquire much of the information they need through non-clandestine means—diplomatic activities, trade representatives, visitors, students, and other open inquiry. They carefully select participants in exchange programs to maximize access to information of intelligence interest. The Soviet government also has access to computerized U.S. and other Western reference systems, to U.S. Government programs designed to facilitate legitimate dissemination of information, and to open literature ranging from technical journals and industry publications to the news media. Soviet collection efforts are further aided by the absence of effective U.S. Government controls over foreign visitors and indirect exports.

The Soviets aggressively screen information on Western technology to avoid technological surprise and to improve their economy and weapons systems. The methods used to acquire technology will depend largely on the cost and the risk involved. It is likely that increased controls on trade with the Soviets and on Soviet visitors and official personnel will cause changes in Soviet collection techniques. Thus, more use of clandestine methods to acquire technology is likely when it cannot be obtained in other ways.

2. Warsaw Pact and Cuba

The intelligence services of Poland, East Germany, Czechoslovakia, Bulgaria, Hungary and Cuba not only serve their own national interests, but also act as surrogates for Soviet intelligence. While a member of the Warsaw Pact, Romania has looser ties to the Soviets in the intelligence arena. Recent cases demonstrate the aggressiveness of the Warsaw Pact services. In 1983, an employee of the Bulgarian trade office in New York was arrested for espionage based on evidence that he bought a secret document on security procedures for American nuclear weapons. The Bell and Harper cases illustrated the effectiveness of Polish intelligence in penetrating U.S. defense industry. East German agents arrested in the United States over the past three years include a women courier in a KGB espionage network and a prominent scientist attempting to recruit American scientists.

The recent interagency report on Soviet Acquisition of Militarily Significant Western Technology documents fully the relationship between Soviet intelligence and the Warsaw Pact services. The

[2] This Report concentrates upon the direct hostile intelligence threat to the United States and does not include the counterintelligence and security implications for the United States of hostile intelligence activities that target U.S. allies or alliances. The Committee will examine these matters in its continuing oversight of U.S. counterintelligence and security programs.

Page 446 of 3957

KGB, more than the GRU, relies on the collection capabilities of the East German, Polish, Bulgarian and Czech services. The success of the East European services can be attributed partly to the Western misperception that their countries are less of a threat than the USSR. East European nationals operating in most Western countries have fewer (or no) travel restrictions and, in some cases, find it easier to work in a Western cultural and commercial environment. At the same time, however, the West also has easier access to Warsaw Pact countries than to the Soviet Union. Reciprocity considerations limit the West's ability to impose extreme controls on East Europeans.

The Cuban DGI has long been under the direct influence of Soviet intelligence. While in recent years the Cubans have emphasized operations against anti-Castro emigre groups and illegal acquisition of embargoed U.S. technology and equipment, Cuban intelligence also targets U.S. Government plans and intentions, especially regarding Latin America. There are indications, dating back many years, of Cuban support and training for Puerto Rican terrorists and of propaganda operations to influence segments of American public opinion.

3. People's Republic of China

The PRC has several intelligence services whose personnel are represented among the approximately 1,500 Chinese diplomats and commercial representatives located at some 70 PRC establishments and offices in the United States. They also have some access to the approximately 15,000 Chinese students and 10,000 individuals arriving in 2,700 delegations each year. PRC intelligence also seeks to exploit the large ethnic Chinese community.

The implications of PRC intelligence activities are markedly different from those of the Soviet Union and its surrogates. The forces of the Warsaw Pact are arrayed against those of NATO; and the Soviet Union's expansionist policy poses a current and continuing global challenge to the United States and its allies. The PRC is not now in strategic competition with the United States. Indeed, the United States has fundamental interests in maintaining friendly relations with the PRC and promoting its modernization, to include selective upgrade of its military defensive capabilities. Intelligence collection priorities of the two major communist powers reflect their respective foreign policies. The Soviet intelligence services have urgent requirements with respect to U.S. plans, intentions and capabilities, as well as technology; the PRC services concentrate primarily on advanced technology not approved for release so as to further PRC military and economic modernization in the 1990s and beyond.

Despite these differences, the PRC intelligence threat continues to be significant. The evidence of PRC espionage in the Chin case and from other counterintelligence sources justifies alerting American citizens to the current risks. The recent detention of a British national employed by the New York Times as a reporter in China reflects an increased emphasis by PRC intelligence and security services on surveillence of foreign visitors. PRC efforts to cultivate Chinese-Americans in scientific and technical fields should be recognized as including potential intelligence approaches, as long as

Page 446 of 3957

the PRC continues to mount espionage operations against classified U.S. programs and embargoed technology.

4. Other Countries

Other countries also conduct human intelligence operations in the United States, both overt and covert. Their targets include largely the same range of interests as those of the Soviets and the PRC, including high technology and political, military and economic policies and intentions that might affect the particular country.

Among the common activities of foreign intelligence services in this country are attempts to penetrate emigre communities. A large number of expatriate political and emigre groups in the United States are viewed as a threat by authorities in the former homelands. From a national security viewpoint, these activities are less significant than those of the USSR and its allies, although they are clearly in violation of U.S. sovereignty and may have an effect on the U.S. political system. Foreign intelligence services also target ethnic groups in the United States, directly or through front organizations, to influence U.S. decisions on foreign aid, trade agreements and other issues where foreign governments have strong interests.

Two recent incidents illustrate the threat from non-communist governments. In 1984, a vocal opponent of the current regime in Taiwan was murdered in California, and the Taiwanese government later admitted that officials of its intelligence service were implicated. Also in 1984, the South African military attache was expelled from the United States for activities incompatible with his diplomatic status. In 1978, the Committee issued a public report on Activities of "Friendly" Foreign Intelligence Services in the United States which examined, as a case study, South Korean operations in the early-to-mid 1970s. The Pollard case has raised questions as to whether the Israeli government, or significant elements thereof, have engaged in more extensive espionage operations in the United States. While the strategic threat in such cases in less than from Soviet bloc or PRC operations, the harm to specific U.S. foreign policy interests and legal safeguards is still substantial and unacceptable.

C. HUMAN INTELLIGENCE TECHNIQUES

The hostile intelligence threat can be divided roughly between the human side and the wide array of technical collection operations. The human dimension begins with the trained intelligence officer, dispatched under official or nonofficial cover to operate abroad. Intelligence officers recruit and handle agents employed by foreign governments, industries, or political organizations; and they "co-opt" other members of their own government and citizenry for particular assignments. In general, hostile intelligence HUMINT operations fall into the following categories:

"Legal" operations are conducted by intelligence officers under official cover. The term does not mean "lawful," because case officers recruit and handle espionage agents. The FBI estimates that at least 30% of the 1,500 Soviet officials in the U.S. are KGB or GRU staff officers. Reportedly, over 3,000 KGB of-

Page 448 of 3957

ficers and approximately 1,500 GRU officers are posted outside the Soviet Union.

"Illegals" are trained intelligence officers sent abroad, often with false identities, who maintain no overt contact with their government. The number of Soviet illegals and their activities are very difficult to estimate.

"Co-optees" are officials or visitors tasked to do particular tasks, such as spotting potential recruits or servicing drops. Many Soviet officials are co-opted, as are many official visitors and some emigres.

"Agents" are American or third-country nationals recruited for current operational purposes or, in some cases, as "sleepers" to be activated at a later date. Apart from the agents surfaced publicly in espionage or illegal export cases, the FBI has numerous other suspected agents under investigation.

Despite the development of increasingly sophisticated technical means of collection, the human agent continues to be the most important key to satisfying a nation's intelligence needs. An intelligence community study summarized the human threat in the following terms:

> The Communist countries depend to a large degree on their human collection networks throughout the world to satisfy their U.S.-related intelligence requirements—requirements ranging from acquisition of advanced technology, location and determination of the quality of strategic and conventional military forces, and assessment of U.S. reaction to international political incidents, to discovery of techniques used by U.S. counterintelligence.

An analysis of hostile human intelligence operations against the United States must address the role of the Soviet-bloc official presence in the United States; the non-official United Nations and "illegal" hostile presence; the recruitment of agents; the Soviet Union's systematic technology acquisition program; and covert political action operations (or "active measures").

1. Official Presence

The spearhead of the Soviet, other Warsaw Pact and Cuban intelligence collection effort is their official presence in the United States. In 1985, there were about 4,250 diplomats, commercial officials and other representatives from Communist countries in the United States, 2,100 of whom were from the Soviet Union and the other Warsaw Pact countries. The Soviet Missions to the United Nations in New York have approximately 275 accredited diplomats; the Department of State has recently mandated a reduction in this number to 170 by April 1988. The Soviets have 320 accredited personnel at their Embassy in Washington and Consulate General in San Francisco, in comparison to the approximately 200 American diplomatic personnel assigned to the Soviet Union. Additional Soviets come to the United States on temporary assignment, as do American personnel to the USSR.

The FBI estimates that at least 30 percent of the Soviet bloc officials and representatives in the United States are professional intelligence officers of the Soviet KGB and GRU or one of the other

Page 448 of 3957

East European intelligence services. Under diplomatic cover, Soviet bloc diplomatic personnel accredited to the United States and to the U.N. missions in New York have complete immunity from criminal prosecution for espionage. (By contrast, Soviet nationals employed by the U.N. Secretariat, such as Gennadiy Zakharov, do not have such diplomatic immunity.)

Soviet bloc use of official representatives for espionage purposes is well documented. In the Walker and Miller cases, Soviet officials involved with handling American agents left the country shortly after their agents were arrested. In other instances, successful U.S. counterintelligence operations have led to the exposure of Soviet officials engaged in clandestine communications with agents, such as by servicing "drops." Soviet bloc intelligence officers under diplomatic cover also seek to use overt contacts with Americans as an opportunity to develop long-term relationships providing an opportunity to assess and exploit vulnerabilities for espionage recruitment purposes. In one case in the early 1980s, a Soviet official who attempted to recruit a Congressional staff member was expelled from the country. The staff member had reported the approach and cooperated with the FBI's investigation, which led to exposure of the Soviet official's intelligence recruitment efforts.

The sheer volume of intelligence activity is increased by the number of officials from other Communist countries in the United States as well as the large number of establishments from which they can operate. Soviet bloc and PRC establishments—government offices and U.N. missions—are located in seventeen different cities. The largest numbers are in New York (92), Washington (34), Chicago (11), San Francisco (9), Houston (9), and Newark (9). While most officials are concentrated in New York and Washington, all but the Soviets are allowed to travel almost anywhere they wish in the country, subject to notice requirements and certain other conditions under the Foreign Missions Act in the case of most Warsaw Pact countries.

Within the Soviet services, GRU personnel are targeted primarily against military and scientific and technical information, while KGB personnel in its First Chief Directorate (foreign intelligence) are assigned to one of four operational departments or "lines"—Scientific and Technical (Line X), Political (Line PR), Counterintelligence (Line KR), or Illegals Support (Line N). S&T personnel specifically target U.S. advanced technology. Often, clandestine collection of S&T information is preferred over buying or developing technology because it is cheaper and provides the best short-term results, although there is a risk factor in theft. KGB Line PR officers target governmental policy information and, frequently, seek to advance Soviet objectives via contacts with persons of influence or through covert activities. Certain Line PR officers focus specifically on the Congress. Line KR officers have the security responsibility for preventing defections of Soviet personnel and particular concern for penetration of the U.S. intelligence community, although all lines are tasked with this important function as a matter of general concern. "Illegals" support personnel comprise a small group that helps maintain those networks.

2. Other Aspects of the Hostile Intelligence Presence

The Soviet Union is effectively using U.N. organizations, particularly the Secretariat, in the conduct of its foreign relations and as a cover for the activities of Soviet intelligence officers and co-optees. The United Nations employs, worldwide, approximately 800 Soviet nationals as international civil servants, with about 300 of them in New York. Approximately one-fourth of the Soviets in the Secretariat in New York are considered to be intelligence officers, and many others are co-optees who have been told to respond to KGB and GRU requests for assistance. The Soviet intelligence services also use their developed agents in the United Nations to collect information on U.N. activities; to spot, assess and recruit American and foreign-national agents; to support worldwide intelligence operations; and to collect scientific and technical information on the United States.

The KGB has succeeded in infiltrating its officers into the U.N. bureaucracy, with some reaching positions of authority. The KGB has held the position of Assistant to the Secretary General since Viktor Lesiovskiy held the post under U Thant. The current Assistant is a KGB China expert. The Soviets take full advantage of U.N. personnel procedures such as liberal sick leave. This permits KGB U.N. employees to be absent as often as they desire, enabling them to carry out intelligence activities further abetted by the comparative freedom of movement enjoyed by U.N. employees.

While the State Department has recently required Soviet U.N. employees to give notice of unofficial travel outside the New York area, they are not subject to the geographical off-limits restrictions placed on Soviet diplomats in response to equivalent restrictions placed on travel by U.S. diplomats in the Soviet Union. Little can be done about the number of Soviets employed by the United Nations in view of the large number of Americans similarly employed.[3]

There have also been reports of the U.N. Secretariat being used for clandestine activity by Warsaw Pack officials. Currently, State Department conditions for travel in the United States by U.N. Secretariat employees from the Soviet Union still do not apply to U.N. employees from other Warsaw Pact countries.

The hostile intelligence threat is further expanded by the number of Soviet bloc commercial entities in the United States that can be used as cover for clandestine collection activities. These commercial establishments include the USSR's AMTORG and INTOURIST, the Polish-American Machinery Company (Polamco), and similar East German, Czechoslovak and other East European entities. Through their legitimate business activities, intelligence officers in those firms have access to Americans in business, industry and government who are potential targets for agent recruitment. A Czech, Pole or other East European is frequently able to contact U.S. companies without arousing the suspicion that contact by a Soviet official would occasion. The primary interests of hostile collectors operating under commercial cover are economic data and

[3] For a more detailed discussion of the Soviets at the United Nations, see the Committee's report on *Soviet Presence in the U.N. Secretariat*, S.Rpt. 99-52 (May, 1985).

advanced technology. Altogether, nearly 70 U.S.-chartered corporations, although owned by Warsaw Pack countries, function legally as U.S. corporations and thus are subject to few restrictions on acquiring technologies. East Europeans employed by these firms are subject to no travel controls or notice requirements.

In addition to the threat posed by their official establishments, U.N. employees and front companies, hostile intelligence services have infiltrated intelligence collectors into the United States among the thousands of exchange students, commercial and cultural visitors, tourists and ship crewmen who enter this country each year. Some 2,000 Soviets come to the United States each year under the auspices of the Soviet Academy of Sciences, the Ministry of Trade, the State Committee for Foreign Economic Relations, and other Soviet agencies. They collect not only overt information for non-defense industries, but also classified and proprietary data, in response to intelligence tasking on behalf of military research projects. The number of U.S. universities and institutes subject to focused Soviet efforts reportedly increased from 20 to over 60 from the late 1970s to the early 1980s.

Soviet trade or scientific representatives travel to California about four times a month in delegations ranging from two to ten people, supplementing the 41-person staff of the Soviet San Francisco Consulate. It is reasonable to assume that, just as 30–40 percent of the personnel in each Soviet establishment are intelligence officers, the same percent of the personnel in a Soviet visiting delegation are intelligence officers and/or co-optees. Thus, the Soviets are able to target more intensively the 1,500 high-technology companies in the area known as "Silicon Valley," which constitute the largest collection of electronics and computer manufacturers in the United States.

In recent years, a number of intelligence agents of the USSR, Cuba and other countries have been uncovered among the flood of immigrants into the United States from Communist countries. While not all of these agents are considered classic "illegals," investigations have determined that many have been sent with intelligence missions.

The deep-cover "illegals" dispatched to the United States in the emigre flow and through other means by Soviet bloc and PRC intelligence services represent a particularly perplexing problem because of their completely clandestine manner of operation. They generally enter the United States under false identities with forged or stolen documents. They often acquire U.S. citizenship, and they have attempted to assume the appearance of ordinary Americans having no connection with their home country and intelligence service.

An example of a KGB illegal agent was disclosed publicly by the FBI in 1981. Col. Rudolf Hermann (a pseudonym) had earlier been identified and recruited to work as a U.S.-controlled double agent. Hermann's 25-year career with the KGB had begun in the 1950s while he was serving in the military of a Soviet-bloc country. His initial training in espionage techniques such as secret writing and cipher systems took place in East Germany. More advanced training was received in the Soviet Union.

Page 452 of 3957

Before coming to the United States, Col. Hermann practiced his intelligence skills in West Germany and Canada. He and his family entered the United States illegally in 1968, and he established a home and found work as a free-lance photographer. He did not directly collect classified information, but performed support functions such as locating drop sites for other agents and spotting potential recruits. He was also prepared to conduct more active collection operations in the event of the expulsion of Soviet officials in time of crisis or war. Col. Hermann's son had enrolled in an American college, under KGB orders, and was preparing to seek U.S. Government employment, possibly in a sensitive position.

3. Recruited Agents

Visitors and emigres are no substitute for recruited agents inside sensitive U.S. programs. The spy of the 1980s has been described as a new breed, motivated more by greed than by ideology. However, the cases uncovered in 1985 suggest more complex motivations; political beliefs, intrigue, and job dissatisfaction or alienation also appear to have been reasons for engaging in espionage. Most Americans arrested for espionage in recent years actually volunteered their services to the other side.

Soviet intelligence efforts include active programs outside the United States against U.S. Government personnel and businessmen. Even those recruited agents who live in the United States are frequently met in third countries to avoid U.S. domestic counterintelligence. Vienna, Austria, was used as the meeting place for John Walker, Ronald Pelton and Edward Howard.

KGB residencies abroad target principally American embassy employees with access to classified information. Other targets include American journalists, businessmen, and scientists who can furnish sensitive technological information, as well as students with job prospects in sensitive positions for long-range development.

The widespread use of foreign nationals in U.S. embassies and consulates compounds the problems faced by U.S. intelligence in most hostile countries. Over 9,800 foreign nationals are so employed for a number of reasons, including cost considerations. Despite their value in dealing with local government organizations because of their language fluency and understanding of local customs and regulations, their threat to the security of U.S. operations must be recognized.

The employment of foreign nationals in U.S. establishments in the Soviet Union and other Eastern European countries, as well as in numerous other countries where the Soviet bloc has influence, affords hostile security services the opportunity to conduct a variety of observations of U.S. personnel and technical penetrations of U.S. facilities. The foreign nationals' personal observations are used by the KGB to assess possible recruitment targets among the American personnel (e.g., those with financial, family, alcohol, or drug problems), as well as to identify U.S. intelligence personnel. The U.S. Embassy in Moscow faces particular problems in this regard. Soviet nationals operate the carpool, including making mechanical repairs and, until recently, operated the telephones, cleaned the offices, and performed all the maintenance tasks in the

Page 452 of 3957

embassy compound. Approximately 200 Soviets are employed at the embassy, contrasted to fewer than a dozen Americans in the Soviet establishments in Washington. The Soviets strictly limit the use of local hires in their own embassies—apparently concerned that if they can succeed, so could U.S. intelligence.

U.S. military installations and personnel abroad continue to attract major Soviet intelligence interest, both to gain potential access to military plans and to acquire sensitive technical data. It is probable that third-country nationals are used to target U.S. bases, just as they are at embassies. There are over 120,000 third-country nationals employed at such installations; and 930 of these have accesses, of which 371 are at the Secret level, to see certain classified material.

4. Soviet Methods of Recruitment

A study by the Defense Security Institute outlines some of the most common Soviet methods of recruiting and handling agents. The agents who steal most of the U.S. classified information lost through human espionage are not foreign nationals, legal or illegal, but Americans already employed in sensitive positions who are recruited, or who volunteer, to provide information to hostile intelligence services.

Social occasions and situations are a favorite hunting ground for Soviet bloc intelligence officers, such as diplomats or U.N. employees, on the look-out for potential recruits. So are restaurants, bars and clubs in the vicinity of defense contractor facilities. The intelligence officer looks for a combination of access to desired information and some motivating factor or factors that might be exploited for drawing a person into espionage. Ideological affinity is not frequently encountered, although it is a desired inducement. Blackmail is a last resort. The most common motivation is financial gain, often combined with conscious or unconscious anger at the employer.

In typical fashion, an intelligence officer proceeds with his cultivation of a prospect by stages, attempting to establish a pattern of payment for seemingly harmless services. The aim is to avoid scaring off the prospect with premature demands for classified information. After classified material is passed, the officer may shift the mode of communication from personal meetings to more secure methods such as "dead drops"—that is, the placement of a package in an inconspicuous agreed location where it can be picked up by the recipient at a later time.

Recruitment of this sort is a process of salesmanship, almost of seduction. Soviet intelligence officers vary in their skill, but some possess the finesse to do an effective job of cultivation without rushing the potential agent. Most of our information concerns the least successful recruitment attempts, such as those reported by persons who become FBI-controlled double agents. KGB training documents, however, describe instances of successful recruitment involving bribery of employees with sensitive access.

In one case cited in KGB training materials, an intelligence officer spotted a possible recruit while serving as interpreter for a Soviet scientist visiting the laboratory of a private U.S. company. The KGB account states that the scientist was aware of his inter-

preter's intelligence function and actively assisted him in that role. The intelligence officer's attention was drawn during the visit to a young lab assistant who seemed poorly dressed. When the Soviet scientist offered to provide copies of a number of his writings to the head of the laboratory, it was revealed that this assistant was studying Russian and could assist in translating the material.

On this basis the Soviet intelligence officer was able to cement an acquaintance with the young worker during the deliberately prolonged process of delivering the documents to the laboratory. As suspected, the lab assistant was having financial difficulties. He was married and attending graduate school and his job was a low-paying one. The KGB officer developed a friendship with him over the course of three months and then began requests for unclassified information in return for payment. Ultimately he persuaded the lab employee to join him in the formation of a consulting firm for the sale of scientific data, which the lab assistant would obtain and the KGB officer would market. In furtherance of this business venture, the lab assistant was persuaded to provide secret as well as unclassified information.

This recruitment approach reflects both subtlety and ingenuity. The prospective agent was never confronted with a stark proposal to spy for the KGB, but was gradually drawn into such activity through apparent friendship and an ostensibly legitimate business arrangement. Similar techniques apparently were used by Gennadiy Zakharov, the Soviet physicist employed at the United Nations who was arrested on August 23, 1986, for buying classified documents from an FBI-controlled double agent whom he had attempted to recruit. See Appendix E for the indictment and an FBI affidavit filed in this case. The recruitment of William Bell, which also used a consulting ploy, is described in Appendix C. The finesse with which a good intelligence officer can draw a person into espionage is a strong argument for informing the FBI when one is approached by foreign officials, as this Report recommends later. Advice from counterintelligence experts can help to prevent tragedies.

Recruitment is more commonly accomplished on the basis of positive inducement than by coercive approaches such as blackmail, which are the last resort for the hostile intelligence service. Blackmail produces the least satisfactory, because least willing, sort of agent. But such methods are nonetheless used with some frequency when preferable methods fail or are unavailable. This is particularly true outside the United States, and especially in Communist countries where hostile intelligence services control the total environment. Entrapment through contrived circumstances can easily be arranged. Sexual entanglements, currency exchange violations and black market involvement are favorite recruitment ploys. U.S. diplomatic personnel, among others, have been targets of hostile intelligence services using these techniques.

Visitors with intelligence value are routinely approached by provocateurs with proposals of this kind, and ensuing arrests or threats of arrest or exposure serve as leverage for enlistment in espionage. For example, employees of U.S. firms with defense contracts who visit the Soviet Union or Eastern Europe will be given special attention and assessment for possible intelligence exploita-

tion. Visa applications reveal where an American works, and falsification of such information is itself an offense that can be used against an American visitor. Whether active recruitment is attempted depends upon whether the American provides indications of susceptibility to inducement or coercion. While travel to Eastern Europe is not, for the most part, discouraged, those who go can reduce their vulnerability by not doing or saying anything that could be recorded or photographed for future reference in the archives of the KGB.

In the final analysis, however, the most dangerous agents of all, who account for the greatest losses of the most highly classified information, are not those who are laboriously recruited, but those who walk in the door of a Soviet embassy somewhere and volunteer information for sale. For the "walk-in" as for the recruited agent, the motivating factors are usually greed or indebtedness plus an additional element of grievance or disgruntlement. The individual usually is dissatisfied with his or her job or harbors some grudge against his organization or both.

Some characteristic signs that may betray an agent at work, if security people and co-workers are sufficiently alert, include:

Attempts to obtain information when there is no need to know and excessive curiosity about what others are doing;

Unauthorized removal of classified material from work areas or introduction of cameras or recorders into work areas;

Repeated overtime or unusual work hours not required by the job; and

Unexplained affluence.

Indicators of espionage are, unfortunately, generally much more noticeable in retrospect than during the course of the crime. In many cases, it is difficult to distinguish the spy from an exceptionally hard worker. But suspicious activities such as those listed, combined with job dissatisfaction or other disgruntlement, would certainly provide grounds for heightened attention to an individual's actions. It was sensitivity to such behavior, after receiving a security awareness briefing in the wake of the Walker-Whitworth arrests, that led Jonathan Pollard's co-workers to alert the FBI, resulting in his arrest and conviction for espionage. This Report later recommends both improved security awareness programs and, in some areas, personnel reliability programs that incorporate peer-group cooperation.

5. Technology Transfer

The Soviet drive to achieve technological equality with the United States and other Western countries has led the USSR to commit enormous resources to the acquisition of open-source information, unclassified but proprietary information, and high-technology equipment that the West has agreed not to export to the Soviet bloc. Soviet intelligence services actively engage in these efforts in addition to their pursuit of U.S. secrets. As a result, the Western lead in many key technological areas has been reduced, with serious economic and military consequences for the United States.

Moscow has devised two programs to obtain Western technology. The first, under the Military Industrial Commission (VPK) of the Presidium of the Council of Ministers, seeks to obtain military and

Page 456 of 3957

dual-use hardware, blueprints, product samples and test equipment to improve the technical levels and performance of Soviet weapons and defense manufacturing equipment. By adapting design concepts from the acquired hardware and documents, the Soviets reduce their own research and development costs. In the early 1980s, more than 3,500 requirements were levied by the VPK each year, with about one-third being satisfied. Some 60 percent of the most significant acquisitions were of U.S. origin, although not necessarily collected in the United States. Nearly half of the up to 10,000 pieces of military hardware and 20 percent of the 100,000 engineering and research documents the USSR acquires annually worldwide are used by the Soviets to incorporate Western technology into their military research projects. Most of the documents, about 90 percent of which are unclassified, contain patented or copyrighted proprietary information and are illicitly obtained.

The GRU is believed to have satisfied considerably more VPK requirements than the KGB. This success is attributed partly to the GRU's greater scientific orientation and its wider variety of technology-related cover positions. The approximately 1,500 GRU officers serving outside the USSR have scientific and technological collection as an integral part of their responsibilities. The KGB S&T unit, Line X, has nearly 300 officers on foreign assignment operating under cover of Soviet embassies, trade and commercial organizations, as members of exchange groups, and as employees of international organizations (the United Nations Secretariat, for instance, as in the case of Gennadiy Zakharov).

The second program, managed by the Ministry of Foreign Trade and the KGB/GRU, seeks, through trade diversions, to acquire relatively large amounts of dual-use manufacturing and test equipment for direct use on production lines. This program attempts to obtain export-controlled microelectronic, computer, telecommunication, machine-tool, robotic, diagnostic and other sophisticated equipment. This program also utilizes both legal and illegal means.

Major Soviet collection efforts are targeted at microelectronics fabrication equipment and computers; nearly one-half of detected trade diversions fall into these categories. The acquisition of much of the information concerning these high-technology areas is not particularly difficult. Information is often available to the public (and, therefore, accessible to the Soviets and their surrogates) from U.S. Government agencies.

The Soviets and their allied intelligence services have for many years been regular attendees of scientific, technical and industrial conferences in the United States and abroad. The Soviets considered some of the information obtained from these conferences to be among the most significant contributions to their military projects. The VPK identifies those having the most potential; in recent years, these have included conferences assembled by several well-known professional engineering societies.

In addition, the Soviet Ministry of Foreign Trade and academic-related collectors contribute to Soviet exploitation of open-source Western information. The Ministry of Foreign Trade has hundreds of trade organizations and companies around the world. KGB and GRU officers operating under cover of these establishments collect large quantities of data openly, in addition to that derived from

64-268 O - 86 - 2

Page 456 of 3957

their covert operations. The Ministry, as an independent collector, helped meet about 15 percent of all fully satisfied VPK requirements during the late 1970s and early 1980s. It specializes in acquiring microelectronics, manufacturing equipment and communications dual-use products.

Equipment is obtained through the use of dummy firms, false end-user certificates and falsifications of export licenses by the Soviets and professional trade diverters whom they hire. Many advances in Soviet microelectronics have been made possible by the illegal acquisition of equipment from the West. The result, according to U.S. Government estimates, has been a marked reduction in the Western technological lead from about 10–12 years a decade ago to about half that today.

Richard Mueller, a West German citizen, has been involved in illegal technology acquisitions for the Soviets for more than a decade. Using dummy and front firms, he has diverted advanced computers and microelectronics equipment of significant value to the Soviets. Mueller was the moving force in the 1983 attempted diversion to the USSR of several Digital Equipment Corporation VAX super mini-computers that would have assisted the Soviets in computer-aided design applications for microelectronics fabrication.

6. Active Measures and Disinformation

"Active measures" and "disinformation" are terms for Soviet covert action operations designed to implement Soviet policy goals by attacking U.S. policy and by promoting a positive image of the Soviet Union. They are significant weapons in the Soviet strategy to discredit and deceive the United States and its allies. The Soviets' principal techniques include the use of front groups, agents of influence, media manipulation and forgeries. The nature and scope of Soviet "active measures" was spelled out in detail in published hearings before the House Permanent Select Committee on Intelligence in 1982 and before the Senate Foreign Relations Subcommittee on European Affairs in 1985.[4] Deputy Director of Central Intelligence John McMahon testified that the Soviets have a $3–4 billion program to influence public opinion in countries throughout the world. It combines all forms of overt propaganda and covert political action, including systematic disinformation efforts.

"Disinformation" is a convenient label to describe a variety of techniques. The classic example is forged documents used to discredit the United States or to supply proof of Soviet propaganda claims. Another method is to recruit and pay agents in foreign news media to slant their reporting and plant false stories. The Soviets also secretly fund and control front organizations and individual agents to promote pro-Soviet or anti-U.S. positions. The Soviets themselves use the term "active measures" to describe their covert disinformation and political influence operations.

---

[4] *Soviet Active Measures*, Hearings before the Permanent Select Committee on Intelligence, House of Representatives, July 13–14, 1982, U.S. Government Printing Office (Washington: 1982).

Soviet Active Measures, Hearing before the Subcommittee on European Affairs, Committee on Foreign Relations, United States Senate, September 12–13, 1985, U.S. Government Printing Office (Washington: 1985).

It is also fair to say that most overt Soviet propaganda is also a form of disinformation because of its systematic distortion of reality to advance Soviet interests. Whenever a prominent Soviet citizen addresses a foreign audience, his or her remarks are likely to reflect a calculated effort to influence the audience. The same is true of Soviet print and electronic media.

Every country tries to sell its viewpoint. What distinguishes the Soviet effort are the immense resources and systematic controls that are employed. Two organizations develop and implement the Soviet "active measures" strategy: (1) the International Department of the Communist Party of the Soviet Union, which coordinates foreign policy and propaganda objectives and now includes most of the work of the Party's former International Information Department; and (2) Service A of the KGB's First Chief Directorate, which conducts covert political influence and forgery operations. The CIA has estimated that if the United States were to undertake a campaign the size of the Soviet "neutron bomb campaign" of the 1970s, it would cost over $100 million.

Currently, there is evidence of a major Soviet active measures campaign against U.S. development of the Strategic Defense Initiative (SDI). The Soviets are making every effort to convince a world audience that SDI will destabilize an already precarious superpower armaments balance. In addition, Soviet active measures directed at U.S. allies, such as in West Germany and Japan, are designed to sow distrust of American policies and to intensify financial and commercial rivalries with the United States by holding out the promise of favorable terms to the business communities in both countries. Such techniques are more subtle than blatant forgeries, which may be less effective in furthering Soviet objectives in sophisticated Western countries.

Soviet active measures efforts are focused primarily on Third World countries. The Soviets appear to employ massive active measures currently in South Asia, in an effort to depict the United States as interfering in the affairs of India, Pakistan and Bangladesh. The media in all three countries have consistently carried stories to this effect. One long-running disinformation ploy concerns alleged attempts by CIA to aid separatist movements in India, thereby splitting the country, supposedly to America's economic advantage. Another frequent theme is accusations of CIA biological warefare efforts in the region. Discrediting U.S. intelligence agencies, particularly the CIA, has long been an important objective of Soviet active measures.

In some cases Soviet active measures directly involve domestic U.S. matters. During July, 1984, for example, the Soviets began a widespread disinformation campaign to discredit the Los Angeles Olympic Games and booster worldwide support for their boycott of them. This campaign featured three forged documents purportedly from racist groups, threatening Third World athletes with bodily harm if they participated in the Olympic Games. Shortly after their discovery, then-Attorney General William French Smith announced that the letters were KGB forgeries and part of a major Soviet disinformation effort. It has been determined that these documents fit the pattern of other Soviet forgery operations and were

part of the overall Soviet active measures campaign to discredit the Reagan administration and its handling of U.S.-USSR relations.

A very recent forgery sought to implicate the Chairman of this Committee. In August, 1986, U.S. news media received copies of a forged letter purportedly from an official of the United States Information Agency to Senator Dave Durenberger, purporting to discuss a proposed plan to exploit the Chernobyl nuclear power plant disaster for propaganda purposes. Analysis of the forged letter revealed that the letterhead and signature had been taken from a copy of an entirely different letter from the USIA official to the President of the Inter-American Defense Board. Ironically, the USIA official's letter had alerted the President of the Inter-American Defense Board to an earlier forged letter, in Spanish, purportedly from the Board President to Chilean President Pinochet. The circumstances of the earlier forgery indicated Cuban-Nicaraguan involvment. (See Appendix F for copies of the forged letters and the true letter.)

According to the CIA's 1982 assessment, it is sometimes hard to judge the success of Soviet active measures because they "tend to capitalize on and manipulate existing sentiments that are parallel to or promote Soviet foreign policy objectives. Whenever a political movement supports policies that coincide with the goals or objectives of Soviet foreign policy, the exact contribution of Soviet active measures to that movement is difficult to determine objectively." The CIA cites evidence that the Soviets themselves believe that their efforts are worthwhile. They appear to consider the "neutron bomb campaign" in Europe to be one of the most successful. On the other hand, the more recent campaign against Pershing and cruise missile deployment in Europe had much less impact. The FBI has described Soviet operations in the United States, moreover, as "often transparent and sometimes clumsily implemented." The FBI also states, "The American media is sophisticated, and generally recognizes Soviet influence attempts."

As noted later in this Report, the U.S. Government has stepped up efforts to expose Soviet disinformation and covert manipulation worldwide. The State Department now regularly publicizes the facts about Soviet forgeries and Soviet control of political organizations such as the World Peace Council, the Christian Peace Conference, and the 12th World Youth Festival.

The most sensitive aspect of the disinformation threat is Soviet deception of U.S. intelligence as part of an attempt to confuse or to manipulate the perceptions of U.S. policymakers. The Soviet military doctrine of *maskirovka* and the KGB concept of *dezinformatsiya* both emphasize the need for measures to mislead opposition intelligence services and to create false perceptions that will influence Western policy and undermine strategic capabilities.

The U.S. intelligence community recognizes the danger of deception and has a community-wide program to assess systematically the possibilities of successful Soviet efforts. The deception threat has been a focus of the Committee's oversight in recent years, and the Committee continues to support intelligence community efforts to maintain vigilance in this area.

One major means of countering any Soviet deception efforts is to leave our adversaries uncertain regarding the full extent of U.S. in-

telligence collection capabilities. Steps to maintain the security of U.S. human and technical intelligence capabilities make it much more difficult for the Soviets to engage confidently or successfully in deception efforts.

D. TECHNICAL COLLECTION OPERATIONS

Hostile intelligence services use the full range of intelligence-gathering technologies to collect sensitive information from the United States and our allies. Public discussion of technical collection methods is more difficult than the explanation of human intelligence techniques, because we do not want to tell the Soviets just how much we know about their operations. Countermeasures against technical threats work best when the hostile service does not recognize U.S. defenses and continues to conduct operations that can be substantially neutralized. At the same time, however, wider knowledge of the technical collection threat is essential to develop better security awareness and to explain the need for major resource investments. Technical threats include the interception of communications, other forms of electronic surveillance, collection of emanations from equipment, penetration of computer systems, and photoreconnaissance.

1. Interception of Communications

The interception of electronic communications and deciphering of machine-generated codes played a vital role in Allied intelligence during World War II—although the methods of collection were so sensitive that many aspects of these operations remained secret for thirty years after the war. An Anglo-American team of top mathematicians and cryptologists provided Allied commanders with vital realtime intelligence on German and Japanese intentions and plans. The interception of electronic communications and the computer-assisted assault on crytographic systems remains a central part of present-day signals intelligence.

The Soviet electronic monitoring effort represents a significant worldwide threat to U.S. military and civil telecommunications. This threat derives from large collection facilities that are operated in the Soviet Union, as well as in other countries around the world, such as Cuba. The Soviets also maintain a fleet of intelligence collection vessels that operate worldwide—including off both coasts of the United States. The latest of these vessels has been built from the keel up specifically for this role, unlike earlier ships that were reconfigured trawlers or other types of vessels. The Soviets also use merchant ships and possibly commercial aircraft to perform collection operations against targets of opportunity.

A serious threat is posed by the Soviet intelligence collection facility located at Lourdes near Havana, Cuba. Established in the mid 1960s, the site has steadily grown to its present size of about 2,000 technicians and is the most sophisticated collection facility outside the Soviet Union.

Evidence of the seriousness of the threat to electronic communications was emphasized by the issuance in 1984 of National Security Decision Directive No. 145, which concluded that "the compromise of U.S. information, especially to hostile intelligence services,

does serious damage to the United States and its national security interests."

The technology to exploit U.S. electronic communications is widespread, and many foreign countries use it extensively. Currently, more than half of all telephone calls in the United States made over any distance are vulnerable to interception. Calls that the caller believes to be on less vulnerable circuits may be automatically switched to more vulnerable ones. The Soviet diplomatic facilities at their Riverdale complex in New York City, at their consulate in San Francisco and at their new Mt. Alto embassy in Washington all occupy high ground, thus providing superior opportunities for communications intercept. The "Silicon Valley" concentration of high technology centers and the government's sensitive facilities in Washington and New York are at risk of intercept because of these Soviet sites.

It is especially important for civilian agencies and the private sector to understand the nature of the risk from Soviet interception of their communications. The Defense Department and the CIA have elaborate programs to inculcate communications security awareness and to protect classified communications links. The massive Soviet surveillance efforts from Cuba and elsewhere demonstrate, however, that the Soviet intelligence payoff from interception of unsecured communications is immense. One reason is that too many government officials and contractor employees discuss classified matters on unsecure lines because of the difficulty and expense of using currently available secure communications equipment. Another significant problem is the Soviet ability to exploit unclassified pieces of information that are relatively harmless in isolation, but in the aggregate provide highly damaging insights into U.S. capabilities. The Committee's classified Report contains several examples of how both industrial and national security can be harmed by such intercepts.

Public awareness of the hostile intelligence threat to domestic communications is essential, because there are real limits to what the U.S. Government can do to provide secure communications for the private sector. Although this Report later discusses some government initiatives, the protection must depend on the willingness of private organizations to invest in secure communications, not only for their immediate self-interest, but for the larger interests of the nation as a whole.

2. Other Forms of Electronic Surveillance

The Soviets have a long history of electronic attacks on the U.S. Embassy in Moscow, dating back to the 1950s when a replica of the Great Seal of the United States in the embassy was found to contain an audio device. In the late 1970s, a Soviet antenna was found in the chimney of the chancery. Additionally, Soviet and other hostile intelligence services try to gain access to office or communications equipment in order to "read our mail."

The vulnerability of the U.S. Embassy in Moscow was dramatized vividly by the recent discovery of the technical compromise of embassy typewriters. The typewriters were shipped to the Soviet Union by unaccompanied commercial means, thus affording the Soviets access to them. The compromised typewriters were used in

Page 462 of 3957

the embassy for a significant period. What made this incident especially astonishing was that it occurred despite a similar discovery in 1978, when security officers found that a shipment of IBM Selectric typewriters destined for the U.S. Embassy had been shipped from Antwerp to Moscow by a Soviet trucking line. The potentially compromised equipment identified in 1978 was returned to the United States before being placed in service. Unfortunately, the Soviets again gained access to several similar IBM machines that were not recognized for a substantial time as being compromised.

As noted earlier, foreign nationals with access to U.S. embassies and other establishments abroad provide a means for hostile intelligence services to make other electronic penetrations. Offices, residences and cars are all vulnerable to the planting of audio or video devices by foreign nationals with access, legitimate or otherwise, to the U.S. target.

Although all high technical threat U.S. diplomatic posts have eliminated the authorized access of foreign nationals to the vicinity of classified work areas, there remains a serious problem of common walls with uncontrolled adjacent areas from which technical attacks and even physical entries can be mounted. Offices and residences are also vulnerable to planted devices when access by foreign nationals is not properly monitored and technical countermeasures are not routinely employed.

In 1985, the Secretary of State's Advisory Panel on Overseas Security, chaired by Admiral Bobby R. Inman, provided to the Intelligence Committees of the House and Senate a classified annex to its report, covering, electronic and physical penetration of U.S. diplomatic facilities. The Inman Panel described the Soviet technical surveillance effort as "a technologically advanced and sophisticated program obviously supported by tremendous resources." The report went on to describe scores of discoveries of Soviet and Soviet-bloc technical exploitation of U.S. diplomatic premises. Noncommunist host nationals have also been detected mounting technical penetrations of U.S. missions.

The threat to office and communication equipment from the exploitation of unintended emissions is greater at U.S. facilities abroad than in the domestic environment, where the risks and costs of detection are considerably higher. Consequently, as noted by the Stilwell Commission on DoD Security Policies and Practices, the previously rigid requirements for expensive equipment shielding have been modified to prescribe shielding only when inspection verifies that a threat exists. There is, however, no question that such a potential threat does exist at especially sensitive locations in this country.

3. Penetration of Computer Systems

The hostile intelligence threat to U.S. computer systems is magnified by the enormous growth in the number and power of computers and the vast amount of data contained in them. The General Services Administration has estimated that the number of U.S. Government computers has increased from 22,000 in 1983 to over 100,000 in 1985. The increase in the number of computers in use in industry, business and other private sectors has been equally stag-

Page 462 of 3957

gering. Computers multiply enormously the information to which a single individual may obtain access.

There is a real possibility that the Soviets may exploit these vulnerabilities. Computers and computer software are high-priority items of both the VPK's and the Ministry of Foreign Trade's technology acquisition programs by legal or illegal means. The Soviet and other Warsaw Pact intelligence services have also obtained information concerning the methods used in the West to provide computer security, and constantly seek more knowledge. Over the past decade, the Soviets have acquired over 300 different types of U.S. and other Western computer hardware and software, which has enabled them to develop the technical ability to penetrate at least some U.S. automated systems. The Soviets are making a concerted effort to access state-of-the-art computers, including supercomputers.

The first Annual Report of the National Telecommunications and Information Systems Security Committee, completed in September, 1985, emphasized the challenge of computer security in both government and the private sector:

> Future technologies, particularly the growth of desktop computers, the increased local storage of data and the widespread networking, will exacerbate existing security vulnerabilities as well as create new ones. As this technology has grown, the resources and awareness needed to allow security technology to grow with it have not kept pace. The use of traditional COMSEC, physical security, personnel security, and administrative security protection techniques does not sufficiently protect the type of information-sharing that is becoming increasingly common in new automated information systems, especially distributed processing and networked systems.
>
> As storage costs decrease, the amount of data stored at the mainframes increases, creating more appealing targets. As the uses of networks and remote access expand, more and more users will have potential access to a broader range of information. As end-users of computers continue to increase their technical competence and computer literacy, the technical and management automated systems security task of protecting data and controlling users has fallen even further behind.

The NTISSC Annual Report admitted that "the full extent of the threat to and vulnerabilitis of automated information systems is unknown." Specific cases of unauthorized access to government computer systems have been detected and reported widely, including cases of access to and manipulation of Defense Department data in order to divert military equipment and weapons. There is no reason to believe that hostile intelligence services or their agents will ignore similar opportunities.

4. Imagery

The final category of technical intelligence collection is photographic or imagery intelligence—collection by means of overhead vehicles against adversary installations. The history of this disci-

pline dates to the use of observation balloons as platforms for photography during the Civil War and then use of aircraft for the same purpose during the two World Wars. The use of U-2 aircraft for imagery collection was extensively publicized in the 1960s. Today U.S. and Soviet imagery intelligence is collected primarily by satellite. The use of photographic satellites by both sides has gained wide recognition in the context of verification of compliance with arms control limitations.

Intelligence collection against the United States and U.S. interests worldwide using photographic means, or imagery, is carried out principally by the Soviet Union (with some assistance from its Warsaw Pact allies and Cuba). The Soviet imagery effort is mainly conducted from spaceborne and airborne platforms. The continued proliferation of Soviet satellites has given the USSR the concomitant capability for increased photoreconnaissance of its most obvious targets—U.S. and NATO strategic and tactical military forces, and crisis situations any place in the world. In addition to these uses of photoreconnaissance, the Soviets employ it to conduct earth resource surveys for economic and agricultural data.

Soviet spaceborne satellite reconnaissance capabilities are supported by the capability of military and civilian aircraft to collect photographic intelligence. The potential value of airborne reconnaissance conducted by the Soviet airline Aeroflot, which, in April, 1986, resumed operations to the United States, and by other Warsaw Pact national airlines' flights remains of concern. These Communist country overflights in the United States are under the jurisdiction of an FAA committee.

The Soviets continue to pursue intelligence-related manned space programs. In February, 1986, they launched a new type of modular space station, the MIR, replacing the older SALYUT-type modules. The MIR, as did the SALYUT, gives the Soviets the capability to perform a number of functions in space, including the use of cosmonauts to augment their other reconnaissance and surveillance efforts. The apparent military usefulness of their manned space program has been indicated in the Soviet announcement that "earth surface surveys" have been conducted; however, no photographs were ever published.

The seriousness of the imagery collection threat posed by Soviet and Bloc overflights in the NATO area can be illustrated by two examples. In March 1985, Norway banned or restricted Soviet and Bloc passenger airplanes from several airports on the basis that they were conducting electronic surveillance. Bulgarian aircraft were specifically mentioned as having departed from scheduled routes to overfly sensitive areas. In West Germany, some 1,500 Soviet Bloc overflights occurred in a three-month period in 1985, offering a tremendous opportunity for both electronic and photographic reconnaissance.

E. SUMMARY

Until the espionage arrests and disclosures of technical security compromises in 1985, the American people and most Government officials did not fully appreciate the magnitude and intensity of the hostile intelligence threat, despite previous espionage prosecutions

and knowledge of the vulnerability of U.S. communications to Soviet intercept operations. The barrage of revelations in 1985–86 has changed these perceptions, so that today there is a better recognition in Government and in the private sector of the continuing efforts by hostile intelligence services to collect sensitive information by human and technical means. There is also a greater awareness of Soviet efforts to influence the political process through "active measures" directed at countries throughout the world.

The Committee intends that this description and analysis of the hostile intelligence threat serve as a benchmark against which to measure further evolution of the threat in the years ahead and the effectiveness of counterintelligence and security programs. It is also important that the American people—especially responsible officials of private organizations in business and industry, science and technology, and international affairs—remain aware of the changing threat from foreign intelligence services. Such awareness does not mean exaggerating the dangers or engendering an atmosphere of suspicion. Rather, it is part of a mature understanding of the reality of U.S. relations with other countries in the world of competing national interests. The political and military rivalry between the Soviet bloc and the West is a fact of life that requires constant attention to ongoing and emerging Soviet bloc intelligence operations.

The hostile intelligence threat is, of course, only half the equation. On the other side are U.S. activities to counter this threat: counterintelligence, to uncover and to neutralize hostile intelligence activities; and security, to protect against both known and undiscovered hostile efforts by setting obstacles in the path of anyone seeking unauthorized access to sensitive information, activities, equipment or facilities. The rest of this Report examines the nature and effectiveness of those critical U.S. programs.

III. Counterintelligence

An effective response to the foreign intelligence threat requires a combination of counterintelligence and security measures. The Committee believes it is important to distinguish between counterintelligence efforts and security programs, while ensuring that both are part of a national policy framework that takes account of all aspects of the threat. The best way to explain the difference is to say that counterintelligence measures deal directly with foreign intelligence service activities, while security programs are the indirect defensive actions that minimize vulnerabilities. The FBI, CIA, and the counterintelligence components of the Defense Department have primary responsibility for operations and analysis dealing directly with foreign intelligence services. In addition, the Committee and the Executive branch have included within the national counterintelligence policy structure those diplomatic and regulatory policies that control the numbers and movements of particular countries' foreign intelligence service officers and co-opted agents in the United States and at U.S. facilities abroad.

Page 466 of 3957

A. NEED FOR A COUNTERINTELLIGENCE STRATEGY

By statute and executive order, counterintelligence functions are divided among the FBI, CIA, and components of the Defense Department. The FBI has the lead within the United States, while the CIA is in charge abroad. The Defense Department, which deals with threats to classified defense information worldwide, divides its counterintelligence functions among the military services, DIA, and NSA. No single official is responsible for the full range of counterintelligence activities below the level of the President and his National Security Adviser. Given these circumstances, there is a constant risk of fragmentation and conflict among organizations with different methods and priorities.

The Committee has found that communication and cooperation among U.S. counterintelligence agencies have improved greatly in recent years and are probably better today than at any time since World War II. Nevertheless, more needs to be done to ensure that agencies learn from each other's experiences and that progress achieved in one area can have benefits for others. The issue is not just communication and operational coordination to bridge jurisdictional boundaries. Better long-range planning is also needed to make optimal use of limited resources worldwide against well-organized and sophisticated adversaries.

Soviet bloc and PRC intelligence operations do not respect geographic boundaries. Thus, in many recent cases Americans who committed espionage in the United States met their foreign intelligence service contacts abroad. The targets and techniques needed for counterintelligence success transcend agency jurisdictions. For these and other reasons, the Chairman and Vice Chairman of the Committee stated in October, 1985, that the Executive branch should develop a national counterintelligence strategy that establishes national objectives and integrates the planning and resources of each agency to achieve these objectives. The President's interim report to the Intelligence Committees indicated agreement with this proposal, and in fact the Executive branch is now preparing such a document.

The organizational structure is already in place, fortunately, to develop a national counterintelligence strategy. Under the National Security Council, there is a Senior Interdepartmental Group for Intelligence (SIG–I) chaired by the Director of Central Intelligence. Within that framework, an Interagency Group for Counterintelligence (IG–CI), chaired by the FBI Director, develops national policy recommendations and provides a forum for agreement on new initiatives. A small secretariat for the IG–CI has expert personnel drawn from the FBI, CIA, and Defense Department. This staff evaluates the threat and recommends policy initiatives for counterintelligence and countermeasures improvements.

The IG–CI, assisted by its secretariat, is the proper place to develop a national counterintelligence strategy. This structure ensures joint participation by the FBI, CIA and Defense Department; and other interested departments and agencies (such as the State and Justice Departments) are also represented on the IG-CI. Ultimate responsibility for resolution of policy issues rests with the Na-

Page 466 of 3957

tional Security Council, which has recently brought onto its staff an experienced FBI counterintelligence specialist.

The President's interim report to the Intelligence Committees indicates that the IG-CI has, in fact, been tasked to frame strategic guidance of the sort proposed by this Committee. As noted earlier, member agencies are now engaged in the drafting process.

Findings and Recommendations

1. Findings.—The IG-CI has been chartered to frame national counterintelligence objectives and an associated strategy (or master plan) to further those objectives, and to submit the objectives and plan for consideration by the SIG–I and thence the NSC. The Committee is pleased to learn that Executive branch agencies are actively drafting this document. This is a positive response to proposals presented by the Chairman and Vice Chairman in testimony before the Permanent Subcommittee on Investigations in October, 1985.

2. Recommendation.—The National Security Council should approve a statement of major counterintelligence objectives and a strategy, i.e., a time-phased master plan, to attain those objectives. The House and Senate Intelligence Committees should receive this document. An effective oversight mechanism should be established to ensure that major programs and associated budgets, legislative proposals, and other key actions are validated against the master plan, constitute judicious and operationally efficient allocation of resources, and achieve all feasible synergism. There should also be a process for continuing review and evaluation.

3. Recommendation.—The National Foreign Intelligence Program should provide for, and Congress should authorize, augmentation of the staff that assists the IG–CI to ensure effective performance of its expanded responsibilities regarding the development and implementation of the national counterintelligence strategy.

B. HOSTILE PRESENCE LIMITS

An effective national counterintelligence strategy should include diplomatic and regulatory policies that control the numbers and movements of hostile intelligence service officers and co-opted agents in the United States and at U.S. facilities abroad. Each year, in the formal classified justification for funds for its Foreign Counterintelligence Program, the FBI advises Congress that, even with increased resources, the FBI cannot cope with the hostile intelligence threat unless measures are also taken to reduce the number of potential intelligence officers in this country. Where the numbers cannot be reduced, controls on their movements can assist the FBI in making better use of limited resources.

The Foreign Missions Act of 1982, which created a new Office of Foreign Missions in the State Department, provided the authority to exercise greater control over the activities of foreign officials in this country. Although such control is normally exercised within the framework of diplomatic reciprocity, the Act also facilitates actions to enhance U.S. security and counterintelligence interests. Limits on numbers of foreign representatives allowed into the United States are usually left to Executive branch discretion, but

the Leahy-Cohen amendment in 1985 established a policy of equivalence between the number of Soviet embassy and consular personnel in the United States and the number of U.S. embassy and consular personnel in the Soviet Union. The 1985 Roth amendment provided for regulation of travel by U.N. Secretariat personnel from countries whose diplomats are subject to such regulations under the Foreign Missions Act.

National Security Decision Directive (NSDD) 196, signed by the President on November 1, 1985, established national policy objectives for restricting and controlling the hostile intelligence presence and travel in the United States. In addition to implementing the Leahy-Cohen and Roth amendments, the Administration has imposed Foreign Missions Act travel regulations on representatives of Warsaw Pact countries whose intelligence services act as Soviet surrogates, has begun reducing the number of Soviet representatives in the United States, and has supported extension of Foreign Missions Act controls to commercial and other entities used by hostile intelligence services in this country. Consistent with these Presidential objectives, Committee Members introduced legislation to establish a policy of equivalence for the size of the U.S. and Soviet Missions to the United Nations (Leahy-Cohen), to broaden the scope of the Foreign Missions Act to cover commercial and other entities controlled by foreign governments (Durenberger-Leahy), to require registration by commercial entities controlled by Warsaw Pact governments (Roth–Nunn), and to require imposition of Foreign Missions Act travel regulations on representatives of Warsaw Pact countries (Roth–Nunn).

The 1985 Roth amendment has been implemented by imposing travel restrictions on U.N Secretariat representatives/employees from the Soviet Union, Afghanistan, Vietnam, Libya, Iran and Cuba. The State Department's Office of Foreign Missions Travel Bureau Service has been required for use by U.N. Secretariat personnel from East Germany, Czechoslovakia, Bulgaria, and Poland. Most recently, it was publicly announced that effective October 1, 1986, the Soviet Missions to the United Nations will be required gradually to decrease their size from 275 to 170, to be accomplished by April, 1988.

In 1986, the Committee received three reports on Executive branch efforts to control the hostile intelligence presence. The first was a report on the respective numbers and treatment of officials from countries that conduct intelligence activities in the United States contrary to U.S. interests and the numbers and treatment of U.S. officials in those countries. Under the Leahy-Huddleston amendment of 1984, this requirement covers the Soviet bloc, Cuba, China, and any other nation designated on the basis of the threat posed by its intelligence or terrorist activities. The second was a report from the Secretary of State and the Attorney General on plans for implementation of the policy of substantial equivalence between U.S. and Soviet embassy and consular personnel pursuant to the Leahy-Cohen amendment of 1985. The third was the annual report of the State Department's Office of Foreign Missions, which regulates many aspects of the treatment of foreign government establishments and officials in the United States.

These reports reflect uneven progress in limiting the hostile intelligence presence in the United States. While the planned reduction in the size of the Soviet U.N. mission is an important step forward, the intent of the Committee in recommending the Leahy-Cohen amendment was also to reduce the number of Soviet embassy and consular personnel in the United States. The plan for implementation of diplomatic equivalence does not achieve that objective. Instead, there is a potential for actually increasing the number of Soviet embassy and consular personnel in the United States if the State Department carries out its plan for a Soviet consulate in New York and permitting a U.S. consulate in Kiev. According to the plan received by the Committee, the number of Soviet diplomatic and consular officials will increase from 320 to as many as 350, depending on the number of Americans sent to Kiev. Current plans call for thirty U.S. officials in Kiev. Apart from the merits of the need for so large an establishment in Kiev, the Committee believes that at a minimum the Soviets should be required to staff their New York consulate within the 320 ceiling on overall representation in the United States. The State Department should plan accordingly to staff the U.S. embassy and consulates in the Soviet Union within a comparable 320 ceiling.

The Committee supports the State Department's plan to reduce the Soviet work force at the U.S. Embassy in Moscow. This plan would also allow the staffing of a small consulate in Kiev within the 320 ceiling and still permit some reduction in Soviet embassy and consular positions in the United States. Such reductions could be made, for example, by refusing to allow the Soviets to replace officials expelled from the United States for espionage-related activity. Further reductions should be possible as the Americans who replace Soviet employees learn to do their jobs more efficiently.

Apart from issues of numerical equivalence, the State Department through the Office of Foreign Missions has made considerable progress in imposing more effective controls. In addition to regulating the travel of Soviet bloc representatives and U.N. Secretariat personnel, the Office of Foreign Missions (OFM) is requiring Soviet bloc embassies to secure prior OFM approval of purchases or leases of property for housing as well as business purposes. A Soviet request to construct a new apartment building in their existing compound in Riverdale, New York, has been denied because it is deemed excessive to Soviet housing needs. On May 28, 1985, the Soviets were advised that their procurement within the United States of building equipment, materials, or services for the remaining construction work at their Mt. Alto site in Washington, D.C., must be arranged through OFM. In response to a Soviet request to expand its recreational facilities at Pioneer Point, Maryland, OFM has told the Soviets they must abide by the same terms and conditions applied to construction on the site of U.S. Embassy recreational property in Moscow.

The Committee believes the OFM program is one of the most important recent counterintelligence initiatives, and is recommending legislation to broaden OFM's authority to impose travel controls on certain Soviet bloc-controlled businesses located in the United States. The Committee also supports OFM's plans to require Soviet bloc missions to lease residential units from OFM, to purchase tele-

Page 470 of 3957

communications goods and services through OFM, and to use OFM banking services. OFM's effectiveness will be enhanced by the Administration's decision to give Ambassador status to its current Director. (By law, his successor will have such status.) The Committee supports the decision to make this appointment, so as to strengthen the Director's ability to deal with foreign representatives.

The need to combat the hostile intelligence presence must also be taken into account in developing policies and regulations for exchange programs. There is clear evidence that some exchange visitors are used for clandestine intelligence purposes. While foreign policy considerations may dictate greater openness between the United States and certain countries, they must be balanced against the counterintelligence risks. The President's interim report to the Intelligence Committees states that efforts are made to do this.

Overseas, the hostile presence problem has three separate dimensions. The first is employment of Foreign Service Nationals (FSNs) at U.S. diplomatic missions. While most attention has been focused on the large number of Soviet nationals employed at our Embassy in Moscow, similar concerns arise in other countries. The Inman Panel on Overseas Security recommended reducing the number of FSNs at embassies in other Warsaw Pact countries and segregating them from sensitive areas and positions in other missions. The State Department has developed a plan to reduce the number of FSNs in Moscow to 95 and to begin such reductions elsewhere.

The Committee supports both the Moscow effort and the modest FSN reductions planned in Eastern Europe. The Administration requested $6.3 million for FY 1986 and $28.3 million for FY 1987 to meet the costs of such staffing changes; the urgent supplemental appropriations bill met $12.0 million of that need. The Committee urges the State Department to reprogram the remaining needed funds, especially if construction funds appropriated in the urgent supplemental cannot be fully expended in FY 1987.

A second aspect of the problem is the employment of over 120,000 foreign nationals at U.S. military installations. Close to 1,000 of these personnel have access to some classified information; roughly 370 have access to some Secret material. The Stilwell Commission recommended stricter personnel security safeguards in such cases, and consideration should also be given to reducing the military's reliance on foreign nationals, who are much more likely to be recruited by a foreign intelligence service than are U.S. personnel. The Committee recognizes that status of forces agreements limit the hiring of U.S. citizens to perform unclassified work at overseas bases, but the number of foreign national employees with authorized or unauthorized access to classified information can and should be reduced to the minimum feasible level. The Committee supports the tighter investigation requirements for foreign employees that have been recommended by the Stilwell Commission.

The State Department plays a key role in developing and implementing these policies and in ensuring that they take into account other U.S. foreign policy objectives. Components of the State Department vary in their understanding and appreciation of counterintelligence concerns. It is important to provide better training and other information on the foreign intelligence threat to State Department officials. While the State Department is not a counterin-

Page 470 of 3957

telligence agency, its officials should be kept fully apprised of the threat so they can be better prepared to support Foreign Missions Office and other policies designed to implement a national counterintelligence strategy.

Findings and Recommendations

4. Recommendation.—Recent Administration initiatives and legislation (Leahy-Cohen amendment, Roth amendment) should be implemented in a manner that places effective limitations on the numbers and activities of hostile intelligence service personnel in the United States and takes into account our foreign policy and intelligence collection efforts. The limit of 320 on permanently accredited. Soviet embassy and consular personnel should not be increased, and the State Department should plan to staff the U.S. embassy and consulates in the Soviet Union so as to require some reduction in Soviet embassy and consular personnel in the United States.

5. Recommendation.—Congress should enact legislation establishing a policy of substantial equivalence between the size of the Soviet and U.S. missions to the United Nations in line with the Administration's plan to reduce the size of the Soviet U.N. Mission.

6. Recommendation.—Congress should strengthen the authority of the Office of Foreign Missions to regulate commercial and other entities controlled by foreign governments and require registration of commercial entities controlled by Warsaw Pact governments.

7. Recommendation.—The Committee supports efforts through the Office of Foreign Missions to enhance U.S. counterintelligence effectiveness, including new initiatives to require Soviet bloc missions to acquire residential property, telecommunications services and equipment, and banking services through OFM. The Committee also supports the granting of Ambassador status to the current OFM Director.

8. Recommendation.—Policies and regulations for exchange programs with other countries should take counterintelligence concerns into account.

9. Recommendation.—The State Department should reprogram whatever funds are needed to supplement the $12.0 million appropriated through FY 1987 to implement plans to replace a substantial number of Foreign Service Nationals with Americans at U.S. missions in the Soviet Union and other high-risk countries. The Defense Department should reduce the use of foreign nationals with access to classified information at DoD installations abroad, and Congress should appropriate sufficient funds to replace them with Americans. Funds for this purpose should be requested in the FY 1988 budget, and DoD should determine what changes may be required in mandated military ceilings overseas.

10. Finding.—In conjunction with the CIA, FBI and DoD counterintelligence components, the State Department should have a program of formal training sessions, briefings and intelligence reporting arrangements to provide more and better information to State Department officials on the foreign intelligence threat and U.S. counterintelligence requirements. The Committee notes with pleasure that progress is being made in this area.

C. COUNTERINTELLIGENCE AWARENESS PROGRAMS

One key to a successful counterintelligence strategy is thorough analysis of the hostile intelligence threat and communication of the results to those who need to take countermeasures. Current efforts range from the FBI's Development of Counterintelligence Awareness (DECA) program for briefing defense contractors to the improved assessment of Soviet deception, disinformation and active measures. Informing the public, industry and other government agencies can have a direct payoff, as in the case where a student at Columbia University contacted the FBI about a Bulgarian exchange visitor after seeing a TV documentary on espionage that described conduct similar to that of the Bulgarian. The student's report led to an FBI offensive double agent operation resulting in the arrest of a Bulgarian intelligence officer. At a classified level, U.S. counterintelligence agencies must work with a great variety of government programs and security officials to provide tailored information and analysis.

On November 1, 1985, the President issued NSDD-197 requiring each U.S. Government agency to establish a security awareness program for its employees, including periodic formal briefings on the threat posed by hostile intelligence services, and to provide for the reporting of employee contacts with nationals of certain foreign powers. These programs are to be tailored to the sensitivities of particular work and designed so as not to intrude into employees' privacy or freedom of association.

According to the NSC staff, department and agency heads have responded positively and have given high priority to this enterprise. The State Department contact reporting directive, which has been provided to the Committee, serves as a good model because it specifies reporting procedures clearly and identifies those countries that require the greatest attention. Civilian agencies without extensive national security responsibilities also appear to be taking this policy initiative seriously.

The Committee strongly supports this policy and is recommending that a similar security awareness program be established for the U.S. Senate. The Committee has used the State Department's new program as its model.

The Larry Wu-tai Chin case highlighted the threat posed by Chinese intelligence operations. As indicated in section II of this Report, however, the PRC intelligence threat differs greatly from the Soviet one. These differences require development of new counterintelligence approaches geared to the special characteristics of the PRC threat. In particular, the FBI should develop specialized threat awareness briefings geared to the unique problems posed by PRC operations. At the same time, FBI threat awareness programs do not—and should not—leave the implication that lawful association with or assistance to Chinese technical and scientific researchers is a sign of disloyalty to the United States.

Another aspect of counterintelligence awareness is the knowledge by agency security officials of when to bring a matter to the attention of a U.S. counterintelligence agency. In the Edward Lee Howard case, CIA security officials failed to alert and involve the FBI in a timely fashion. The CIA has taken steps recently to guard

against a recurrence of this problem. The FBI should continue to work closely with security officials of all U.S. Government agencies to ensure that they understand its requirements and guidelines. A good example is the Pollard case, where the Naval Investigative Service Command brought in the FBI at an early stage. The Committee is pleased that the Navy has given a commendation and a monetary award to the official who was responsible for bringing the FBI into the Pollard case promptly when certain questionable behavior was observed.

The lessons of the Howard and Pollard cases should be extended to all departments and agencies that handle highly sensitive information. Interagency procedures for reporting suspicious conduct to the FBI should be strengthened. Moreover, the Howard and Pelton cases demonstrate that former employees with grievances or financial problems can compromise our most sensitive national security programs. Individuals who choose to work in positions as sensitive as those occupied by a Howard or a Pelton should expect to be held to a higher security obligation than personnel with access to less sensitive information. Therefore, the FBI should be informed when employees with access to extremely sensitive information resign or are dismissed under circumstances indicating potential motivations for espionage. The decision as to whether the circumstances justify investigation in varying degrees should be made by the FBI, in light of its counterintelligence experience, not by the employing agency. Interagency procedures should be established to address borderline cases.

Threat analysis functions are shared among U.S. counterintelligence, foreign intelligence and security agencies. Development of an effective national counterintelligence strategy, as well as a comprehensive and balanced set of security measures, requires centralized assessment of the threat posed by all forms of collection—technical as well as human. Since 1981, an interagency staff has compiled assessments of the hostile intelligence services threat and U.S. countermeasures, based on inputs from throughout the Government. The Committee has found these assessments to be increasingly valuable and is pleased that they continue to have high priority.

National assessments are no substitute, however, for high-quality threat assessments tailored to meet more specific needs. The Committee is pleased to learn that progress is being made regarding one such need for tailored material that was highlighted in the most recent interagency assessment.

DoD counterintelligence agencies have taken the lead in analyzing the threat to particular military installations and activities. The Committee supports increased efforts in this area, especially to assess the threat to highly sensitive research and development projects and to make the findings available to the officials responsible for security countermeasures. In recognition of the importance of this function, the Stilwell Commission has recommended, and the Secretary of Defense has directed, that the Defense Intelligence Agency establish a Multidisciplinary Counterintelligence Analysis Center as a service of common concern for DoD to meet the counterintelligence analytic requirements of the Defense Counterintelligence Board and the various DoD components. DIA should have

the task of ensuring that other agencies' threat assessments are responsive to security and program management needs of DoD components. Efficient allocation of limited security resources depends on careful evaluation of the threat.

Special attention is required for two aspects of the hostile intelligence threat that directly relate to U.S. foreign intelligence analysis: deception; and "active measures," including disinformation, forgeries and other political influence operations. Hostile intelligence services conduct these operations in addition to their collection efforts.

An interagency committee and a community-wide intelligence analysis office are both active in the analysis of deception efforts. Pursuant to the Committee's classified reports accompanying the Intelligence Authorization Acts for FY 1985 and FY 1986, a small interagency staff has been assigned to the analysis office.

In recent years, with the help of the intelligence community, the State Department has stepped up efforts to expose Soviet "active measures," such as forgeries and Soviet control of political organizations and conferences abroad. The Committee supports recent initiatives to improve intelligence support for U.S. efforts to counter these Soviet activities.

The State Department and other appropriate agencies should do more to disseminate the results of such analyses to opinion leaders and policymakers worldwide. Recent steps to increase the effectiveness of the Active Measures Working Group, which is chaired by State/INR, are welcomed by the Committee. The Working Group has briefed U.S. embassies on its role, encouraged the formation of embassy committees to monitor and combat Soviet active measures, and arranged for both classified and unclassified guidance to be provided to the field on specific cases. These efforts should be supported and fully staffed by the relevant agencies, especially the State Department. The Committee is pleased that a new office has been established recently in State/INR for this purpose.

The FBI prepares reports and testifies before Congress on efforts in the United States by the Soviets and other designated countries to influence public opinion and government policy through "front" organizations and other covert operations. For example, in 1986 the Committee received a classified FBI report on "Trends and Developments in Soviet Active Measures in the United States," which updated a previous study prepared in 1982. The FBI report reviews covert Soviet political influence operations directed at U.S. public opinion and policymakers. The Committee regularly requests further counterintelligence information from the FBI on such operations. The Bureau should continue to report these assessments in a manner that provides the necessary facts about hostile intelligence activities and that fully respects First Amendment rights.

Findings and Recommendations

11. Recommendation.—All elements of the U.S. Government should give high priority to implementation of the policy requiring security awareness briefings and the reporting of contacts with nationals of designated countries. A similar procedure should be adopted for U.S. Senate personnel.

12. Recommendation.—The Howard case demonstrates the need for strengthening interagency procedures for bringing possible espionage cases to the FBI's attention in a timely manner. The FBI should also be informed when employees with access to extremely sensitive information, such as Howard and Pelton, resign or are dismissed under circumstances indicating potential motivations for espionage.

13. Recommendation.—The FBI should develop threat awareness briefings tailored to the special characteristics of the PRC espionage threat. Such briefings should alert American citizens to the risks of giving assistance to PRC nationals who may have espionage assignments, while respecting the freedom to associate with lawful scientific and technical research.

14. Finding.—Significant efforts are underway to improve counterintelligence threat analysis, including publication of regular interagency assessments of the hostile intelligence services threat and U.S. countermeasures and the establishment in DIA of a Multidisciplinary CI Analysis Center to meet DoD threat analysis requirements in conjunction with other DoD components. The Committee is also pleased to note that there has been progress in the effort to provide tailored analyses of the hostile intelligence threat.

15. Recommendation.—The relevant interagency intelligence analysis office should coordinate and sponsor analytic efforts on Soviet deception, disinformation and active measures. The State Department and other agencies should increase dissemination of information about Soviet active measures abroad. The FBI should continue to be responsible for reports on active measures in the United States by hostile intelligence services and should cooperate with interagency analytic efforts. Reports on active measures in the United States that are prepared by agencies other than the FBI should be prepared in coordination with the FBI and/or the Attorney General.

D. DOMESTIC OPERATIONS

Counterintelligence operations in the United States differ from such operations abroad, because the environment is generally more favorable. U.S. counterintelligence has greater resources, easier access to the target, and public attitudes favorable to citizen cooperation. While legal requirements place constraints on surveillance techniques and investigative methods, those limits are vital for maintaining our free society and (with exceptions discussed below) do not inhibit necessary counterintelligence efforts.

Domestic operations can be divided into the following categories: surveillance coverage of foreign government establishments and officials; offensive operations to recruit agents-in-place and defectors or to control double agents; and espionage investigations and prosecutions. Many of the strategic requirements for domestic operations are unique, especially with respect to surveillance of establishments and officials and the investigation and prosecution of espionage cases. Other requirements have more in common with overseas operations, particularly with regard to penetration of hostile services, handling of defectors and double agents, and analysis of the *bona fides* of sources. Unique features of overseas operations,

as well as personnel management and training programs that cross geographic divisions, are treated in later sections of this Report.

1. Coverage of Establishments and Officers

The foundation for domestic counterintelligence is systematic collection on a foreign country's official representatives in the United States. Such collection may be technical or human.

Recent cases have shown the vital importance of comprehensive coverage of Soviet bloc embassies and consulates as a means of detecting offers to sell U.S. secrets. Pelton, Cavanagh, Jeffries and others made their initial contacts with the Soviets by contacting an establishment. Skilled counterintelligence work is required in such cases, and frustrations may be unavoidable. The Pelton case is an example in which it took years to achieve a positive identification.

The stratgegic importance of covering certain foreign establishments and their employees justifies continuing resource investments to upgrade the FBI's surveillance capabilities. The Committee has supported such investments over the years and continues to do so.

In this connection, the importance of the contact reports discussed earlier in this Report cannot be overemphasized. While government regulations can require federal employees to report contacts with possible foreign intelligence officers, a free society must rely on the voluntary cooperation of private citizens to advise the FBI of approaches and other contacts by such officials. Frequently the FBI requests citizens to report this information about particular individuals, based on surveillance of a contact. The FBI's DECA briefings, which are designed to encourage such contact reports from defense contractors and their employees, have now reached over 15,000 contractor employees. FBI and other intelligence community officials have used speeches and public appearances to emphasize the importance of public cooperation.

The American people have a legitimate concern that their government should not intrude upon their lawful associations with foreign officials and their First Amendment right to exchange ideas with visitors from abroad. For that reason, the FBI operates under guidelines established by the Attorney General and internal FBI policies overseen by the Committee that are designed to respect the free exercise of constitutional rights. As Director Webster stated in a recent speech:

> We certainly don't have enough Agents to keep track of every citizen of this country nor do we want to investigate the activities of lawful organizations without predication for doing so. Rather, our focus—indeed our strategy—must be on the intelligence operatives themselves and the identification of those who have come here with intelligence commissions. By building a spiderweb throughout the United States that focuses on them rather than on our own citizens, we make it much more difficult for those who would betray our country by surreptitiously supplying national secrets to foreign intelligence officers. I believe that in a free society this is the only way we can function without turning ourselves into a police state.

The existence of those safeguards should give the public confidence that cooperation with FBI counterintelligence not only serves the national interest, but is consistent with respect for constitutional rights.

Findings and Recommendations

16. Recommendation.—Congress should continue to fund increases in FBI surveillance capabilities.

17. Recommendation.—American citizens in all walks of life should be encouraged to assist U.S. counterintelligence efforts by providing information to the FBI, either upon request or when they are approached by possible foreign intelligence officers.

2. Offensive Operations

A major element in counterintelligence is offensive operations, especially efforts to recruit agents-in-place within hostile intelligence services and to induce defections from those services. The strategic payoff of agents and defectors can be immense, as demonstrated by the exposure of Edward Lee Howard and the successful prosecution of Ronald Pelton.

The greatest area of concern is the handling of defectors, as dramatized by the Yurchenko case. According to a CIA survey, most of the defectors resettled in the United States with CIA assistance are basically satisfied with their treatment. Nevertheless, a significant minority have problems that require special attention on a continuing basis.

In the aftermath of the Yurchenko re-defection, the CIA has undertaken a comprehensive review of its practices for handling defectors. Deputy Director of Central Intelligence Robert M. Gates summarized the CIA's conclusions and corrective actions at his confirmation hearing on April 10, 1986:

> There were organizational deficiencies. We have made organizational changes so that a single individual and a single organization are accountable and are in charge of the entire process for defectors. Another element that we have changed . . . is to ensure that the same person is basically the principal case officer for a defector with continuity, so that a defector isn't facing a whole new set of people all the time and there is somebody there that he gets to know and that he can depend upon and that understands him and understands his concerns, and can identify when he is going through a particular psychological crisis. . . .

Mr. Gates also called it "imperative" to assign individuals who speak the same language as a defector so that someone is available to talk in his or her own language; he did not know, however, whether the CIA has actually been able to implement this approach.

The actions taken and under consideration by the CIA reflect a constructive effort to upgrade the defector program and respond to the lessons of the Yurchenko case. They need continuing high-level support, both in the CIA and in other agencies. The Committee will

continue to assess the CIA improvements along with other approaches.

The Executive branch continues to examine the broad question of how defectors might best be welcomed, assisted and utilized. A private organization formed to assist defectors, the Jamestown Foundation, has recommended major changes in the defector handling program. The Committee intends to follow this issue closely in the coming year and looks forward with great interest to seeing the results of Executive branch deliberations.

The Committee considers it of the utmost importance that our nation's goals in welcoming and assisting defectors be more clearly enunciated and boldly implemented. Too often, the only operative goals have been the national security benefits that result from debriefing a defector; the defector's personal security against attacks by his or her country's security services; and enabling the defector to survive without continuing U.S. Government intervention. Other goals must be added to that list: to encourage achievement in American society consonant with the defector's talents and accomplishments; and to assist the defector in making a continuing contribution to the United States. While the Executive branch has taken steps to administer its current defector program more effectively, it must also effect this important change in attitude and commitment.

The Permanent Subcommittee on Investigations of the Senate Committee on Governmental Affairs has begun a major study of the U.S. Government's handling of defectors and other refugees from the Soviet Bloc. This study will focus particular attention on the contributions that defectors can and do make to American society and on the need to encourage that process. The Intelligence Committee supports this PSI study and is cooperating with the Subcommittee in its effort to inform the public regarding the needs of defectors and of the agencies that assist them.

Perhaps the greatest risk in a strategy of penetrating hostile services is that the agent-in-place or defector may be a double agent, pretending to be recruited by or escaping to the United States but actually controlled by a hostile counterintelligence service. Disputes over the *bona fides* of sources have plagued the U.S. intelligence community in the past. Such differences are sometimes unavoidable, but they should not disrupt interagency cooperation. Counterintelligence is not an exact science. The important thing is not to rely on a single source without careful testing and corroboration of his information. In this regard, the Committee has sought and received assurances that intelligence officials are alert to the risk of over-reliance on the polygraph.

The FBI, CIA, and DoD counterintelligence components have made extensive use of double agents, as evidenced in the recent Izmaylov and Zakharov cases. Last June, the Soviet air attache, Col. Vladimir Izmaylov, was expelled after being apprehended by the FBI. On August 23, Gennadiy Zakharov, a Soviet physicist working for the United Nations, was arrested and charged with espionage. Both Soviets had been maintaining clandestine contact with individuals who were cooperating with the FBI.

There is a clear need for these operations to be carefully managed. Counterintelligence managers must also review operations to

ensure that they have not been compromised. The Committee found Executive branch officials sensitive to these and other issues raised by double-agent operations.

The most difficult counterintelligence task is countering the use of "illegals," that is, hostile intelligence service officers who operate under deep cover rather than official cover. Some "illegals" may be used primarily for performing espionage support functions (e.g., clearing drops). The FBI and the Justice Department should consider improved ways to prosecute "illegals" for such espionage support activity.

Findings and Recommendations

18. Finding.—In the aftermath of the Yurchenko re-defection, the CIA has made improvements in its procedures for handling defectors. The Committee will continue to review the implementation of those procedures to ensure that needed resources and personnel, as well as continuing high-level support, are provided. The Administration has commissioned an independent assessment of the CIA defector resettlement program, and the results will be provided to the Committee.

19. Recommendation.—Objectives for the defector resettlement program must include encouraging the fullest possible achievement in American society and assisting defectors to make a continuing contribution to the United States. The Committee strongly supports the efforts of the Permanent Subcommittee on Investigations of the Senate Governmental Affairs Committee to focus public attention on the contributions that defectors can make to American society and on the need to enhance their ability to make such contributions.

20. Finding.—The Executive branch has reassured the Committee regarding the risk of over-reliance on the polygraph in testing sources and defectors and has demonstrated sensitivity to issues concerning the mangement of U.S.-controlled double-agent operations.

21. Recommendation.—The Justice Department and the FBI should work together to develop improved ways to prosecute "illegals" who perform espionage support functions. If further legislation is needed, the Justice Department should so inform the Congress.

3. Espionage Investigations and Prosecutions

Espionage investigations that may lead to criminal prosecution raise delicate issues of interagency cooperation and balancing of interests. Some senior officials support impostition of the most severe penalties on an individual found to have engaged in espionage on behalf of a hostile foreign power. Law enforcement objectives may conflict, however, with counterintelligence requirements and other national security interests.

Espionage cases involving non-Soviet bloc countries raise foreign policy issues, because of the desire of the United States to maintain good relations with particular governments. In the recent Pollard and Chin cases, however, the Executive branch has demonstrated its willingness and ability to investigate and prosecute espionage by agents acting on behalf of friendly countries—in these cases,

Israel and China. The Committee fully supports enforcement of the espionage laws, without regard to the foreign country involved. This policy does not necessarily conflict with other U.S. objectives requiring good relations with such countries, so long as it is applied even-handedly. The United States should make clear to every country that it will not tolerate violation of our espionage laws and that it will investigate the intelligence operations of countries that control or permit the commission of espionage in or against the United States on their behalf. The Committee is pleased with recent assurances of State Department cooperation with enforcement action whenever evidence of espionage is presented.

For many years U.S. counterintelligence officials assumed that information acquired by intelligence techniques could not be used for law enforcement purposes because of legal obstacles and the need to protect sources and methods. The Foreign Intelligence Surveillance Act and the Classified Information Procedures Act have made espionage prosecutions somewhat easier, although other difficulties still remain. These problems include the use of certain investigative techniques, the need for more expertise in handling sensitive espionage matters, and requirements for better cooperation among and within agencies.

One of the principal differences between espionage investigations and other criminal cases is the overriding need for secrecy to protect counterintelligence sources and methods. That is why Presidents have asserted claims of "inherent constitutional power" to authorize the use of intrusive techniques with Attorney General approval rather than a judicial warrant. That is also why Congress has established a special secure court order procedure under the Foreign Intelligence Surveillence Act and exempted counterintelligence from the law enforcement procedures for access to bank records in the Right to Financial Privacy Act. U.S. counterintelligence officials have consistently contended that ordinary judicial procedures do not provide adequate security in dealing with hostile intelligence services. In normal criminal cases the objective—either immediate or long-term—is always prosecution in open court. Counterintelligence operations have other objectives that may be more strategically important, such as learning the methods of the hostile service.

Federal law does not adequately take account of such differences in several areas. The FBI has found that the counterintelligence exemption in the Right to Financial Privacy Act is insufficient to obtain access to bank records when financial institutions refuse to cooperate on a voluntary basis. Consequently, the FBI is requesting legislation to give U.S. intelligence agencies the authority to require financial institutions to provide access to records. Unlike the law enforcement procedures under the Right to Financial Privacy Act, neither a court order nor notice to the subject of the records would be required. The FBI has a strong case for replacing the current voluntary system with a law that provides mandatory access for counterintelligence purposes within a framework of Attorney General guidelines and congressional oversight to provide safeguards against abuses. The Committee, therefore, has included legislation to address this need in the Intelligence Authorization Act for Fiscal Year 1987.

There is a similar problem with access to telephone and other telecommunications records. Paradoxically, it is easier in some states to wiretap an individual than to get the phone company to provide access to his or her billing records. For security reasons, the law enforcement alternative of a grand jury subpoena is usually impractical; and the Foreign Intelligence Surveillance Act does not cover access to records. As with bank records, the FBI is asking for legislation that provides mandatory access for counterintelligence purposes to such telecommunications records as telephone billing records. The Committee has incorporated such legislation in the Intelligence Authorization Act for Fiscal Year 1987.

A third gap in federal law concerns physical searches. The Foreign Intelligence Surveillance Act (FISA) authorizes a special court composed of Federal District Judges to grant orders for electronic surveillance to meet counterintelligence requirements, but the Act does not apply to physical search. The FBI supported broadening the Act to cover searches as part of the intelligence charter legislation considered by the Committee in 1980, but the only provisions of the charter to be enacted were the congressional oversight authorities. Pursuant to Executive Order 12333, the Attorney General authorizes warrantless searches for counterintelligence purposes.

The absence of a statutory court order procedure creates at least two problems. First, as with bank and telephone records, there is no authority to require cooperation from private parties. Second, the Federal appeals court in the *Truong* case ruled that evidence derived from a warrantless counterintelligence search may not be used in court if the search occurs after the Government decides to prosecute. Neither problem exists for wiretaps and other forms of electronic surveillance under the Foreign Intelligence Surveillance Act, which provides a court order procedure to secure the cooperation of private parties and permits the use of information for law enforcement purposes with appropriate security.

In light of this situation, the Committee recommended in 1984 that legislation be developed to establish statutory procedures comparable to FISA for physical search. The Committee is prepared to develop and introduce such legislation in cooperation with the Executive branch.

The President's interim report to the Intelligence Committees comments, "It is imperative that FISA be retained as it now exists." The Committee similarly endorsed FISA in 1984, finding that it has resulted in "enhancement of U.S. intelligence capabilities" and also "contributed directly to the protection of the constitutional rights and privacy interests of U.S. persons." The Committee believes that physical search legislation can be achieved, with Executive branch support, without endangering FISA.

Espionage investigations and prosecutions would also be more successful if greater expertise and resources were brought to bear in certain areas. Since 1985 the Army has reorganized its counterintelligence efforts and instituted a specialized training program to develop greater expertise at the field level in espionage investigations.

The espionage prosecutions in 1985 and 1986 demonstrated the importance of early consultation with Justice Department attorneys in developing tactics that reconcile intelligence and law en-

forcement interests. In the Pelton case, close cooperation between NSA, and the FBI, and the Justice Department resulted in a conviction with minimal disclosure of sensitive information. In the Sharon Scranage case, the combined efforts of the CIA, the FBI, the Justice Department, and the State Department produced a strategy that successfully led both to two convictions and to the exchange of the Ghanaian official convicted in the case for several prisoners in Ghana and their families.

The Committee understands that such consultation is now being instituted in a more timely manner than often occurred in the past. This welcome coordination requires that the Justice Department, in turn, have a sufficient number of attorneys trained and experienced in handling the unique problems in these cases. The Committee is especially concerned that those attorneys learn how to maintain controls on the release of sensitive information. Department attorneys should also work with U.S. counterintelligence agencies in potential espionage cases to ensure that their methods are as consistent as possible with successful prosecution. In this regard, the Justice Department's Criminal Division has begun to build a cadre of experienced personnel and to provide additional training to United States Attorneys.

The Howard case, which is discussed in some detail in the Committee's classified Report, revealed serious shortcomings in CIA performance relating to espionage investigations. The Committee is pleased to learn that the CIA has taken steps to correct problems pinpointed in investigations by its Inspector General and an interagency group. The Committee will monitor the implementation of those changes.

Issues relating to the handling of the Howard case by the FBI and the Justice Department have also been pinpointed and are the subject of continuing consideration. The Committee expects remedial actions to be taken, as appropriate, and will continue to follow this matter.

Findings and Recommendations

22. Recommendation.—The United States should not tolerate violation of our espionage laws by any country and should investigate the intelligence operations of countries that control or permit the commission of espionage in or against the United States on their behalf. The Committee is pleased to learn on their behalf. The Committee is pleased to learn that the State Department has pledged to cooperate with enforcement action whenever evidence of espionage is presented, and the Committee supports efforts to set up a mechanism for regulatory interagency consultation on cases that might warrant action.

23. Finding.—The Foreign Intelligence Surveillance Act continues to be considered by U.S. counterintelligence agencies to be highly beneficial to their efforts. They strongly favor retention of FISA as it now exists.

24. Recommendation.—Congress should enact legislation to give the FBI the authority to require financial institutions and telecommunications carriers to provide access to records, with notice restrictions comparable to FISA. Any such authority should be limited to counterintelligence matters, governed by the current Attor-

ney General's guidelines, and accompanied by improved provisions for congressional oversight.

25. Recommendation.—Congress should enact legislation comparable to FISA to authorize physical search for intelligence purposes, so as to reduce legal uncertainties in counterintelligence investigations that have prosecution as one of their objectives.

26. Recommendation.—U.S. counterintelligence agencies should continue to emphasize, as standard procedure, consultation with the Justice Department at an early stage in potential espionage cases. The Justice Department should provide increased training to Criminal Division attorneys and U.S. Attorneys concerning the prosecution of espionage cases, including the need to protect sensitive information relating to such cases.

27. Finding.—The CIA has taken some steps that are likely to improve counterintelligence investigations and prosecutions, in the wake of investigations of the Howard case. The Committee will monitor implementaton of those improvements.

28. Recommendation.—The FBI and the Justice Department should take actions, as appropriate, to remedy shortcomings exposed by the Howard case.

E. OVERSEAS OPERATIONS

Strategic counterintelligence objectives abroad differ from those in the United States not only because of the different environment, but also because of the added requirements for counterintelligence support in intelligence collection programs. The Committee welcomes recent CIA initiatives to improve both its counterintelligence efforts and its career opportunities in counterintelligence.

The Committee's classified Report discusses further issues regarding CIA and Department of Defense counterintelligence activities overseas.

The investigation of espionage by U.S. civilian and contractor personnel abroad raises jurisdictional questions. The Committee believes that the FBI should be called in and should work closely with agency security officials from the outset.

Findings and Recommendations

29. Finding.—The CIA has begun initiatives to improve its counterintelligence efforts.

30. Recommendation.—U.S. agencies abroad should continue to obtain the timely advice and assistance of the FBI in cases of possible espionage by civilian and contractor personnel.

F. PERSONNEL MANAGEMENT AND TRAINING

Counterintelligence is not the main function of any of the organizations responsible for U.S. counterintelligence programs. The CIA's primary task is collection and analysis of political, economic and military intelligence; the FBI is a law enforcement organization; and each of the service counterintelligence organizations is part of a larger criminal investigative or intelligence agency. This is one reason why there have been less specialized training and fewer incentives for careers in counterintelligence. Personnel are recruited for law enforcement or intelligence positions generally

and are usually not assigned to counterintelligence until they have experience in other fields. The advantage of this practice is that personnel can develop their basic investigative or intelligence skills in less sensitive areas before taking on more important counterintelligence duties. The disadvantage is that specialization and career advancement in counterintelligence may be discouraged because of the organization's emphasis on other functions.

Every agency is taking steps to upgrade counterintelligence training, but the results thus far have been uneven. More should be done to encourage agencies to share their experience with successful methods. While each agency operates in a different environment and with different internal regulations, joint discussion of such topics as the nature of the threat from particular hostile services and the techniques for offensive operations and counter-espionage investigations could be very useful. This would also make more efficient use of expert personnel who assist in other agencies' training. In the CIA and the military services, better training in agency guidelines is also needed.

In the aftermath of the Miller case, the Committee has taken a close look at FBI personnel management policies for counterintelligence. At the Committee's request, the FBI prepared a study reviewing the impact of FBI personnel policies on the Foreign Counterintelligence (FCI) Program in order to determine how the FBI may more effectively recruit, select, assign, train, promote, and retain Special Agents for counterintelligence matters. The FBI study indicated a need for improvements in several areas.

The FBI confronts unusual personnel management problems because of the large hostile intelligence presence in New York City, where the cost of living has discouraged FBI Agents from seeking assignments or pursuing careers. Unlike State Department personnel, FBI Agents in New York do not have a special housing allowance to defray the cost of living in town. The Committee believes that action is needed to improve benefits and incentives in New York and is prepared to develop legislation that may be needed for this purpose.

Another manpower issue is the limited number of FBI senior grade positions in the counterintelligence field, as compared to positions as Special Agent in Charge of a field office and comparable headquarters positions with primarily law enforcement duties. The Committee supports efforts to change this situation, including funds requested in the FY 1987 budget to increase the number of senior grade counterintelligence positions at FBI Headquarters. The Committee also supports the FBI policy requiring that all new Special Agents in Charge of field officers who have not previously served in a full-time counterintelligence position must receive FCI training.

The Committee intends to continue its review of FBI counterintelligence personnel policies as part of a broader ongoing study of intelligence community personnel issues.

DoD counterintelligence components have similar problems and should develop appropriate revisions in personnel policy to encourage specialized counterintelligence career development. In all the DoD counterintelligence units, as well as the FBI, greater efforts are needed to recruit and retain the best possible personnel.

Findings and Recommendations

31. Recommendation.—More should be done to encourage agencies to share their experience with successful CI methods and to make more efficient use of expert training personnel.

32. Recommendation.—Additional measures should be taken to improve benefits and incentives for FBI Agents in New York City, including any legislation needed to give the FBI comparable authority to the State Department.

33. Finding.—The FBI is planning to increase the number of senior grade counterintelligence positions at FBI Headquarters. The Committee supports these efforts.

34. Recommendation.—While each counterintelligence agency must recruit to satisfy its unique needs, greater attention should be given to determining specialized qualifications required for personnel to meet each agency's CI needs as distinct from law enforcement or foreign intelligence needs.

35. Recommendation.—DoD counterintelligence components should continue to develop appropriate revisions in personnel policy to encourage specialized counterintelligence career development.

IV. Security Countermeasures

In 1984–85 the Executive branch conducted seven in-depth studies of security policies and practices for protecting classified information and activities against hostile intelligence collection. The Committee has reviewed findings and recommendations from all of these studies, as well as observations and proposals made by other Congressional committees, by witnesses at the Committee's closed hearings, and by experts inside and outside the Government. Taken together, these reports and recommendations raise grave questions regarding U.S. security programs to protect sensitive information from our adversaries.

The Walker case disaster and the bugging of typewriters in our Moscow embassy were compromises that waited years to be uncovered and that illuminated significant weaknesses in the nation's security. There have been wide disparities in policies and standards for personnel, information, technical and other security measures. Serious imbalances in resource allocation have existed, and in some areas inadequate resources have led to serious gaps in protection. Research and development to improve security has been haphazard at best.

Since the late 1970s, the Committee has worked with the Executive branch and the intelligence community to strengthen counterintelligence throughout the Government, so that the FBI, CIA and DoD counterintelligence components could deal more effectively with the hostile intelligence threat. Until 1985, however, neither this Committee nor any other congressional body had taken a similarly comprehensive look at the defensive security countermeasures that surround the core of classified information and that are supported by counterintelligence. The Committee's closed hearings in the fall of 1985 were the first systematic Congressional review of security programs since the 1957 report of the Commission on Government Security established by Congress (with Senator John Sten-

nis as its Vice Chairman). Although the Committee is encouraged by many of the steps now being taken to remedy serious deficiencies, the continuing fragmentation of security planning and policy requires a substantial reorganization of the way the Government handles its many security programs. Congress has a similar duty to put its own house in order; and the Committee has specific recommendations for that purpose as well.

The Committee has addressed security countermeasures at two levels. First is the national policy level, where government-wide initiatives and programs are developed, approved and overseen. Many of the most serious security weaknesses result from the lack of an effective, national policy that gives high priority to security programs and ensures comprehensive and balanced planning. The second level is the numerous separate security disciplines, which each have their own problems that must be solved within a coherent national policy framework. These disciplines include information security, personnel security, communications security, computer security, emanations security (TEMPEST), technical surveillance countermeasures, physical security, industrial security and operations security. Their variety itself clearly indicates how difficult it is to pull together the necessary expertise and reconcile the interests of different agencies and programs—intelligence, military, diplomatic, industrial, research and budgetary. Nevertheless, the effort must be made if we are to reduce the likelihood of future compromises that repeat the multi-billion dollar damage of the Walker, Pelton, Howard, Harper and Bell cases or the incalculable harm from interception of our communicatins and technical penetration of U.S. facilities.

We would not wish to mislead; in any foreseeable environment, U.S. security countermeasures programs can provide no absolute guarantees against compromises and losses. Our goal is a significant improvement in security, a further limiting of the damage that is wreaked by those compromises and losses. Our belief is that more effective, but not unduly intrusive measures can accomplish this objective.

A. A NATIONAL STRATEGIC SECURITY PROGRAM

In December, 1985, the Committee recommended to the National Security Council that the Excutive branch develop a comprehensive and integrated National Strategic Security Program to coordinate and foster the protection of sensitive information and activities from the efforts of hostile intelligence services. The purpose is three-fold.

First, such a program would give greater visibility, higher priority and increased attention of senior officials to security countermesures. Frequently, security programs have neither an influential voice in government departments and agencies nor adequate funding and career opportunities. Security must be recognized by the Executive branch and Congress as a crucial underpinning to the other basic functions—military, intelligence and diplomatic—that safeguard national security.

Second, the reason for such a program is to provide a coherent structure to address and overcome security deficiencies. As dis-

cussed in the following sections, these problems include underfunding of essential programs, significant gaps in research, inadequate training and career development, insufficient management accountability, uneven national policy guidance, interagency conflicts over new initiatives, and failure to ensure necessary linkages among security disciplines.

Third, the establishment of such a program and structure should provide long-term continuity and consistency through succeeding Administrations. The changing of NSC structures from one Administration to the next does not fill the pressing need for continuity and consistency of policy. When a National Strategic Security Program has taken shape, therefore, the essential features should be promulgated by the President in a formal Executive Order.

At the Committee's closed hearings in late 1985, senior officials were asked to discuss how U.S. counterintelligence and security countermeasures policies are established and coordinated at the national level. The answer for counterintelligence was clear: responsibility is focused on a single NSC committee process (the Interagency Group for Counterintelligence (IG–CI) and the Senior Interdepartmental Group for Intelligence (SIG–I)), with support from an interagency staff which assists the NSC staff in coordinating policy initiatives and overseeing their implementation. Much progress has been made in developing a coherent process for counterintelligence policy. The same cannot be said for security countermeasures, where responsibilities have been widely diffused and the Executive branch has only begun to develop a coherent policy review structure.

The DCI testsified that the SIG–I is "the principal forum where the national perspective can be brought to CI [counterintelligence] and CM [countermeasures] policy," with countermeasures handled by an Interagency Group (IG–CM) chaired by the Deputy Undersecretary of Defense for Policy. At the same time, however, the DCI acknowledged the existence of "other Executive branch policy recommending and implementing entities such as the DCI Security Committee, the National Telecommunications and Information Systems Security Committee, the SIG for Technology Transfer, etc." While the DCI said the SIG–I system has " the capability for and mission for ensuring proper national-level coordination of all CI and CM matters," this has not in fact been the case for security countermeasures.

Recently, the DCI, acting in his capacity as Chairman of the SIG–I divided the Interagency Group for Countermeasures into separate groups for Technical matters (IG–CM(T)) and for Policy and other non-technical issues (IG–CM(P)). The new IG–CM(T), headed by the Assistant Secretary of Defense for Command, Control, Communications and Intelligence, is intended in part to serve as a bridge between the intelligence world of the SIG–I and the world of the National Telecommunications and Information Systems Security Committee (NTISSC). The NTISSC is chaired by the same Assistant Secretary and has a presidential mandate under NSDD–145 to develop communications, computer and emanations security policy for the whole government.

The DCI also abolished the DCI's Security Committee (SECOM), which had been a working-level intelligence community group out-

Page 488 of 3957

side the IG–CM but covering some of the same issues. The two new IG–CMs are to have subcommittees that will handle many of the former SECOM functions, but with more senior members than was the case with SECOM, so that subcommittee members can actually commit their agencies to act upon group recommendations. Staffing is to be achieved through an up-graded interagency staff.

These structural changes are very welcome signs of the seriousness with which the Executive branch is approaching the need to improve the security policy process. The Committee does not believe, however, that they go far enough in establishing a forum in which all the many security interests can be surfaced and reconciled. It is uncertain, moreover, whether the IG–CM subcommittee will be sufficient improvements on the SECOM structure to overcome the bottlenecks that too often have stifled progress on security issues. The Committee continues to believe, therefore, that a comprehensive National Strategic Security Program must be developed, through whatever structures the Executive branch finds best suited to that task.

In recommending establishment of a comprehensive National Strategic Security Program, a Committee does not intend to create a "czar" or to take from individual agencies their responsibility for implementing national policies that affect their work. If there is no national policy, however, there is no standard against which to hold each department accountable. If national policies are fragmented, outdated or unbalanced, security becomes subordinated to other departmental priorities and interagency disputes. This has occured far too often in recent years. Later sections of this Report give examples: the inability to reach agreement on a "single scope" background investigation for Top Secret and SCI clearances; the proliferation of special access programs without sufficient controls and standards; the imbalance in resources between expensive technical safeguards and the personnel and information security measures needed for effective computer security; and, at least until very recently, interagency conflicts over how to deal with some technical security issues.

As important as it is to remedy these problems, the greatest value of a National Strategic Security Program should be to promote innovative solutions to new and emerging hostile intelligence threats. This requires collaboration with counterintelligence agencies to identify such threats, as well as recruitment and training of top-quality security specialists with wide-ranging operational, technical, analytical, and managerial skills. At the core must be a commitment at top management levels within each department and agency to setting clear security objectives, providing adequate resources, and devising effective oversight and inspection procedures for holding managers and commanders accountable for their performance. This commitment will be forthcoming only if Congress and the President make clear they expect it and establish their own systematic means to assess government-wide progress in meeting national goals.

A National Strategic Security Program should provide policy direction and oversee implementation for all security disciplines:

Personnel security;
Information security;

64-268 O - 86 - 3

Page 488 of 3957

Communications, computer and emanations security;
Technical surveillance countermeasures;
Physical security;
Industrial security;
Operations security.

To assist the NSC, a single body shoud be assinged responsibility for policy planning and analysis of all aspects of security countermeasures for protection of sensitive information against hostile intelligence efforts. It should ensure effective coordination among the other interagency forums that address particular problems. It should have the task of putting together for the NSC and the Congress a fully balanced and coordinated government-wide program. A senior official should be designated to testify on the National Strategic Security Program before the appropriate Congressional committees.

During 1985, the CIA and the State Department took significant steps to achieve the same objectives on a departmental level. The CIA reorganized and expanded its Office of Security to integrate all its security functions. Similarly, as recommended by the Inman Panel on Overseas Security, the State Department established a new Diplomatic Security Service with higher status and wider responsibilities, including a high-priority effort to upgrade technical security. The Stilwell Commission has recommended a similar action by the Defense Department, stressing "that all security disciplines have as their fundamental purpose the protection of classified information and must be applied in a fully balanced and coordinated way." The Committee urges that resources be allocated to enhance security policy and oversight in the Office of the Secretary of Defense (OSD), so as to make the policy-level integration of the various security programs in DoD a viable option.

A significant aspect of the National Strategic Security Program should be to assist the NSC on resource priorities. The current budgetary arrangements are fragmented and inadequate. To consider ways to improve the resource allocation process, the Committee held a closed hearing on June 4, 1986, on principal security programs outside the NFIP, as well as those in the CIA Office of Security. The ultimate goal of the Committee is to have each department and agency identify its security resources by function and program and include these resources in their congressional budget justification submissions. The National Strategic Security Program should give the NSC and Office of Management and Budget a similar opportunity to evaluate the resource priorities of these and other security countermeasures programs.

Another high priority for the National Strategic Security Program should be an assessment of requirements for research and analysis, especially on personnel security and the interfaces between personnel, communications and computer security. The greatest imbalance in security resources is between costly projects on technical safeguards and the meager efforts to look into personnel security issues. Not until January, 1986, was DoD able to get the necessary concurrences for a modest personnel security research program in DoD to be administered by the Navy. Current arrangements for intergency assessment of security research needs have been insufficient to identify and promote aggressive and bal-

Page 490 of 3957

anced government-wide efforts, even though particular agencies have taken valuable initiatives in areas of concern to themselves.

Special emphasis should also be placed on commander and manager responsiblity for security within their respective organizations. The recent action of the Deputy Secretary of Defense ordering the incorporation of security management as a criterion in military and civilian performance and fitness reports is a step in right direction. Such a requirement should be extended government-wide and apply to all contractors as a condition for inclusion on a bidders list. Other realistic sanctions are needed, as well as greater consistency in the government and among contractors on the severity and application of such sanctions as fines, relief for cause, debarment and suspension, for knowing or negligent security violations both by managers and by subordinates. The National Strategic Security Program should supply the necessary policy direction.

Security normally ranks well below other careers in most agencies; the National Strategic Security Program must change the status of the security profession. Security specialists should match other professionals in terms of their qualifications, training, compensation and career opportunities. There should be an independent evaluation of the recruitment, training, pay, status, professional development and retention of federal security officers in all departments and agencies. As recommended by the Information Security Oversight Office and the Stilwell Commission, the OPM job classification standards for security should be revised immediately to ensure comprehensive and accurately graded descriptions of modern security disciplines.

One of the common themes in all recent studies of security countermeasures—the Information Security Oversight Office (ISOO) task force, the Stilwell Commission, and the Inman Panel—is the need for better training not only for security professionals, but also for managers and other officials having security responsibilities. In the near-term, the quality of training for new security personnel must have special attention. Through the government, security initiatives are providing funds for new personnel. Agencies should be held accountable for ensuring that the most qualified personnel are recruited and that their training meets high standards.

The National Strategic Security Program should establish government-wide security training objectives for managers, security professionals, personnel security clearance adjudicators, and industrial security officiers. Minimum levels of training and certification should be established for industrial security personnel, clearance adjudicators, and other positions requiring consistent standards. Because the Defense Investigative Service and the Defense Security Institute (DSI) have crucial roles in the development and implementation of security training programs and industrial security generally, an expanded government-wide training role for DSI should be considered. The Information Security Oversight Office has made a similar recommendation. DSI could serve as a national security training and education center serving all federal departments and agencies. Consideration should also be given to forming under DSI an interagency group, with counterintelligence agency participation, to develop and review effective security awareness

Page 490 of 3957

educational material and techniques. Given the concentration of sensitive facilities on the West Coast, establishment of a permanent West Coast security training facility for government and contractor personnel should be considered.

One of the most challenging and difficult tasks that a National Strategic Security Program must address is the development of coherent and effective policy for operations security (OPSEC). OPSEC has many definitions amoung the various departments and agencies. It can include the implementation and assessment of U.S. efforts to frustrate hostile intelligence collection. Another element is the careful design of particular unclassified activities or information to keep hostile intelligence services from putting together bits and pieces of information to detect classified missions or the presence of sensitive installations.

Equally important is the assessment of government practices outside the national security field that could help or hinder hostile intelligence collection efforts. The recently established National Operations Security Advisory Committee of the IG-CM(P) has taken several valuable initiatives in restricting public availability of sensitive data.

A 1985 interagency assessment identified serious OPSEC weaknesses. The National Strategic Security Program should develop government-wide OPSEC objectives and ensure that relevant agencies have the necessary resources and programs to achieve these goals. Just as sensitive military units take care to ensure that changes in routine activity will not provide our enemies indications and warning of their operations, so must agencies and contractors involved with sensitive agencies or programs incorporate OPSEC in their overall security philosophy and programs.

These are some of the government-wide security issues that should be addressed by a National Strategic Security Program. Others are detailed in the sections below on personnel security; information security; communications, computer and emanations security; technical and physical security; and industrial security.

Findings and Recommendations

36. Recommendation.—The Executive branch should develop and implement a comprehensive National Strategic Security Program which would provide:

a. NSC-approved objectives and policy direction;

b. A broad master plan faithful to the objectives and policies, and both based upon and prioritized in light of the threat;

c. Close coordination of implementing programs;

d. Assessment and allocation of resource requirements for all areas of common concern—such as, but not limited to: R&D; computer security; TEMPEST and personnel security; and core training for technical security countermeasures;

e. Oversight of implementation of national policy; and

f. A review of total resources planning.

This program, although within the NSC, should be structured so as to provide long-term continuity and consistency through succeeding Administrations. Accordingly the program and the essential structure for its maintenance should be promulgated by the President in an Executive Order.

37. Finding.—Recent IG-CM changes promulgated by the DCI, although not sufficient, in the Committee's view, to solve the problem, are a welcome sign of the seriousness with which officials are addressing the need to improve the security process.

38. Recommendation.—The Defense Department should enhance its security policy and oversight capabilities in the Office of the Secretary of Defense so as to ensure integration of policies for the various DoD security programs

39. Recommendation.—The National Strategic Security Program should evaluate security countermeasures resource priorities for the NSC and OMB on an annual basis. Security resources should be identified by function and program in departmental and agency budget justifications. The Administration and the Congress should consider additional ways to implement a more coherent budget process for security programs.

40. Recommendation.—The National Strategic Security Program should assess requirements for research and analysis on security countermeasures to promote aggressive and balanced efforts government-wide, especially on personnel security.

41. Recommendation.—The National Strategic Security Program should emphasize commander and manager responsibility for security, including government-wide application of the recent DoD action to incorporate security into performance evaluations and development of more realistic and consistent policies for disciplinary sanctions.

42. Recommendation.—The National Strategic Security Program should commission an independent evaluation of the recruitment, training, pay, status, professional development and retention of federal security personnel. Relevant OPM job classifications should be revised and modernized.

43. Recommendation.—The National Strategic Security Program should establish government-wide security training objectives and should require minimum levels of training and certification for industrial security officers, clearance adjudicators, and other positions requiring consistent standards.

44. Recommendation.—The National Strategic Security Program should consider phased assignment of national responsibilities for security training to the Defense Security Institute (DSI), with an interagency group including representation from U.S. counterintelligence agencies to develop security awareness materials. DSI should establish a West Coast annex.

45. Recommendation.—The National Strategic Security Program should develop government-wide operations security (OPSEC) objectives and ensure that relevant agencies have the necessary resources and programs to achieve those goals.

B. PERSONNEL SECURITY

The most important barrier to the hostile intelligence threat and the growing willingness of Americans to divulge classified information for financial gain is a sound personnel security program. Unfortunately, recent Executive branch and congressional studies have identified significant weaknesses in U.S. Government personnel security practices. Many of the issues raised by the Report of

the Commission on Government Security in 1957 remain unresolved today, particularly the need for national policy guidance and oversight. The Stilwell Commission, the DoD Industrial Security Review Committee (formed after the Harper espionage case), the Permanent Subcommittee on Investigations of the Senate Governmental Affairs Committee, other interagency assessments, and investigations of agency performance prompted by recent espionage cases have all addressed deficiencies, inconsistencies and ineffectiveness in the administration of personnel security policies and programs. Development of a more coherent and effective personnel security policy should have the highest priority in a National Strategic Security Program.

The Stilwell Commission, while finding the DoD security program "reasonably effective," made the following critique:

> Clearly there is room for improvement. Many people are cleared who do not need access to classified information. Background investigations yield relatively little derogatory information on those being cleared, and under the existing adjudication process, far fewer still are actually denied a clearance. Once cleared, very little reevaluation or reinvestigation actually occurs, and relatively few indications of security problems are surfaced. The principle that a cleared individual is authorized access only to that information he "needs to know" is generally not enforced.

The Commission attributed these problems to insufficient resources and the desire not to let security interfere with mission accomplishment.

The Committee endorses vigorous implementation of most of the Stilwell Commission's recommendations on gaining and maintaining access to classified information and on detecting and investigating security violations. They should be reviewed at the NSC level and adopted for government-wide application. In summary, the Commission proposes:

For Secret clearances, better background checks, an eventual reinvestigation system, and better workplace controls (document logs and briefcase searches).

For Top Secret information, many more reinvestigations, more polygraphs primarily for reinvestigations, better workplace controls (a personal reliability program and a ban on one-man access), and a special crypto-access compartment.

More inspections and management responsibility.

Not issuing clearances for information to personnel who require only access to the workplace.

Measures to reduce the number of clearances and streamline security requirements for contractors, including a billet system to cut the number of Top Secret clearances, justification for each contractor clearance (with periodic rejustification for overseas positions), and a single scope for Top Secret and SCI background investigations.

To free resources to cover other costs, the easing of reinstatement procedures for contractors whose clearances lapse for a short time and the routine granting of interim Secret clearances while initial investigations are conducted.

These recommendations reflect the most comprehensive and detailed analysis of DoD personnel security requirements that has been conducted in decades. Nevertheless, in some respects they fall short of meeting current needs.

The first requirement is resources. Personnel security is seriously underfunded, especially in comparison to the technical programs for communications and computer hardware and software. Redressing this imbalance should be one of the highest priorities for a National Strategic Security Program. Congress added $25 million for the Defense Department in FY 1986 to reduce the backlog of investigations and, especially, of reinvestigations of persons with Top Secret clearances. The Committee has recommended, and the Senate has passed, an additional $22 million authorization and 358 positions for FY 1987 to accelerate implementation of Stilwell Commission recommendations, primarily regarding more detailed investigations for Secret clearances. Intelligence elements have also regularly fallen short of meeting periodic reinvestigation goals because of inadequate funding. This is true as well for the FY 1987 budget. The basic problem is that personnel security has had relatively low priority in the Executive branch budget process. The Committee welcomes recent testimony by the DDCI that the CIA will give much higher priority to reinvestigations.

Nowhere is the adage "penny wise, pound foolish" more apt, yet even the Stilwell Commission had to confront serious resource constraints. Its goal is to reduce the DoD backlog of reinvestigations for persons holding Top Secret clearances to manageable levels within four years and to conduct periodic reinvestigations of all persons holding Secret clearances and above by 1995. Efforts to reduce the number of positions requiring background investigations can alleviate some of the pressure, but the technological sophistication of modern military systems and the need for widespread access to intelligence products requires that large numbers of DoD personnel have at least Secret-level clearances. On the civilian side, the work of Departments such as State, Energy, Justice and Treasury will continue to require that many employees have background investigations and reinvestigations.

Over the years, resource constraints have prevented any serious consideration of field investigations for Secret clearances, which have been based on name and fingerprint checks of law enforcement and counterintelligence files. Some of the most sensitive information in the U.S. Government is classified at the Secret level, and sustained passage of Secret information to hostile countries would do grave damage to national security in many areas. The Harper case is a good example where compromise of a substantial amount of Secret information from a defense contractor's office did great harm. The current requirements for Secret clearance investigations are too low, and the proposals for wider checks are too modest.

At a minimum, the investigative requirements for a Secret clearance should include, in addition to file checks: a credit check; inquires to present and past employers; more documentation of identity; other field inquiries on recent life history; and a subject interview. The key is the interview, to surface issues that may merit further investigation. This recommendation requires a substantial

increase in manpower and funds, but the cost is reasonable in light of the Soviet bloc intelligence emphasis on acquisition of Secret-level technological data.

Overall, the Stilwell Commission goal of eliminating the reinvestigation backlog within four years should be extended government-wide and to contractor employees. In addition, a government-wide plan for Secret clearances should be developed and submitted to the Committee, with a target of implementation in less than the ten years proposed by the Stilwell Commission. A government-wide funding plan to achieve all these objectives should be submitted to Congress as soon as possible.

Another resource problem results from the resistance of some authorities to modification of Top Secret and SCI background investigation requirements that Defense Department officials have concluded are not cost-effective. Because the Defense Investigative Service, CIA and OPM have different policies on the scope of those investigations, it is not unusual for individuals, particularly in industry, to have two or more background investigations in the same year for Top Secret and SCI access. Moreover, some agencies appear unwilling to simplify their background investigation procedures in the light of cost-effectiveness studies. While the Committee has not attempted to evaluate alternative procedures in detail, it strongly recommends that a uniform policy be established to achieve less costly and more timely background investigations and clearances and to eliminate redundant investigations.

Another factor that should guide development of a "single scope" investigation is the high priority for reinvestigations. Recent espionage investigations indicate that none of the current approaches to initial clearance is infallible. Espionage-related issues rarely surface during initial background checks. Streamlining the procedures for initial investigations would release manpower for use in meeting the five-year reinvestigation requirement that all agencies agree should apply to Top Secret and SCI Clearances.

The Committee also believes that a "single scope" background investigation for Top Secret and SCI clearance should include an in-depth interview of each subject by a trained and experienced security officer. The record indicates that such interviews are often effective in surfacing issues not uncovered by a field investigation that bear on the ability of an individual to handle sensitive information.

Several Stilwell Commission proposals deserve special emphasis. A reliability clearance for persons needing access to a site, but not to classified information, would underscore the importance of "need to know." There are no figures on the number of people with clearances where the intent is solely to determine their reliability. Included in this category are guards, char force, maintenance personnel, etc. Implementation of this measure would set the stage for carrying out such other measures as a "billet control system" describing which positions require access to classified information. This action will help revive the need-to-know rule by drawing a clear distinction between clearance for one purpose and clearance for other purposes.

The Committee shares a concern, expressed initially by the Permanent Subcommittee on Investigations, about the potentially seri-

ous risks in issuing security clearances to foreign-born individuals whose background cannot be verified adequately. The Stilwell Commission's proposal for use of the polygraph in such cases is comparable to the FBI's policy of polygraphing foreign nationals employed for specialized purposes. Agencies must guard against overreliance on the polygraph, of course, especially when independent corroboration is so difficult to obtain. Other approaches tailored to particular agency needs should also be considered. A government-wide minimum standard is needed, however, in order to ensure cross-agency acceptance of clearances.

One Stilwell Commission recommendation that should be reconsidered is the proposal for one-time, short duration (read on, read off) access by cleared personnel to the next higher level of classified information when necessary to meet operational or contractual exigencies. Given the vast differences between investigative standards for Secret and Top Secret, there is too great a risk in giving an individual with only a Secret clearance access to Top Secret information. If the requirements for Secret clearances are substantially upgraded, this proposal could be reconsidered as a means to conserve security resources. As the Stilwell Commission recognized, administrative oversight is essential to ensure that repeated read on, read off access does not become a loophole for semipermanent access.

Several areas of concern not mentioned by the Stilwell Commission deserves serious consideration. One is the need for relevant data on persons who leave positions with Top Secret or sensitive compartmented accesses. Pelton, Howard and, for the most part, Walker committed espionage after each had lost his clearances.

Walker's greed and his aberrant conduct as a private investigator could have alerted a Navy system tasked to continue oversight of individuals with previous high clearances. No such system effectively exists. Pelton's bankruptcy should have served as the indicator for further NSA review, particularly in view of Pelton's access to very sensitive information. Had Howard's travels and finances been known, the FBI might have been brought into that case much sooner.

The Executive branch should consider requiring as a precondition for clearance, that those who receive access to the most sensitive information agree to permit, for a period of years after their clearance ends, access to relevant financial and foreign travel records. In practice, for example, this would mean that agency security officials could access credit bureau information on former employees, as DoD agencies are now doing on background investigations and reinvestigations pursuant to the Stilwell Commission's recommendation.

Such a system could be abused if not clearly limited to persons with access to especially sensitive information and properly administered under stringent safeguards for privacy and civil liberties. It would be important to establish clearly, for example, that the examination of these records would not imply suspicion regarding a person. Another useful safeguard might be to limit the information gained from these records to an employee's security file unless the Director of Security certified that it warranted the attention of another office or the FBI. Other minimization procedures, perhaps based upon those in the Foreign Intelligence Surveillance Act,

could also be applied. In addition to providing better means to detect suspicious behavior, records access procedures could enable security offices to respond in a timely and helpful fashion to evidence of financial problems among personnel whose recent sensitive accesses would make them lucrative intelligence targets.

The Committee recommends that the Executive branch study the possibility, in consultation with appropriate congressional committee and civil liberties experts, of a program of expanded post-access foreign travel reporting obligations and/or agency access to relevant financial and travel records. The Committee believes that such a program, if combined with proper safeguards and limited to those persons whose access to the most sensitive information clearly warrants special measures, might be acceptable from a civil liberties standpoint. A similar view has been expressed by a ranking ACLU official at a recent conference sponsored by the Congressional Research Service of the Library of Congress.

Another initiative, relevant to the role of a National Strategic Security Program in fostering and coordinating research, is examination of the value of psychological testing in the security clearance process. Some authorities contend that such testing can help identify persons disposed to disregard their obligations for the sake of self-gratification. Any use of psychological testing, however, should take full account of the need for test reliability, trained personnel to interpret results, and protection of individual rights. Psychological testing can supplement, but not replace other screening devices.

The Stilwell Commission urged the Secretary of Defense, although not in a formal recommendation, to press for revival of the interagency effort chaired by the Justice Department in 1983–84 to draft a new Executive Order on personnel security. While drafting such an order may be a lengthy process and must not be an excuse for inaction on the specific national policy issues discussed above, a new Executive Order would make an important contribution to better personnel security. Such an order should provide a formal Presidential mandate for minimum government-wide standards and procedures that incorporate the essential elements of national policy on key topics, with details to be spelled out in an implementing directive that can be updated periodically in light of experience and research. Second, it should establish an office similar to the Information Security Oversight Office to provide the kind of policy guidance and oversight of implementation that ISOO has supplied for information security. The absence of such an office makes it extremely difficult for the National Security Council to address personnel security policy issues government-wide. Third, a new Executive Order should focus exclusively on policies and procedures for access to classified information and to facilities where classified information is maintained. Experienced Justice Department officials believe that such an order would make it easier to defend in court decisions to deny or remove security clearances.

More extensive and timely background investigations and reinvestigations, with streamlined government-wide standards and procedures, must feed into an adjudication system with rigorous but realistic criteria for granting or denying clearances. There is currently no uniform requirement to deny a clearance to a person who

Page 498 of 3957

has been convicted of a felony or has admitted to conduct which constitutes a felony under state or local law. There is no requirement for follow-up inquiries in cases where clearances are granted to persons admitting problems like drug use. (The FBI has expressed particular concern about this problem in contractor facilities, where habitual drug users have posed real threats to sensitive research and development programs.) There is no government-wide requirement for training of persons who adjudicate security clearance cases. (Only one agency currently has a formal adjudicator training school and individual services tend to have too few adjudicators to justify their own training programs.) The lack of training and experience among adjudicators causes delays and inconsistencies within and among agencies.

Agency and interagency investigations of such recent espionage cases as Edward Lee Howard and Jonathan Pollard have highlighted serious flaws in agency hiring, assignment and termination practices. The CIA and DoD have moved to rectify problems, and there will probably be interagency consideration of adopting similar corrective measures. The CIA and other agencies have also become more sensitized to the risks inherent in decisions to give sensitive assignments to persons with a history of personal problems. While there is a balancing need not to do away with necessary managerial flexibility, these corrective steps are basically much needed and long overdue.

Underlying these specific problems is a general attitude that the purpose of the clearance process is simply to wed out those individuals most obviously likely to pose a threat to security. Wider background checks will have little impact if the results are not used effectively. Especially for Top Secret clearances and for the most sensitive Secret clearances, the policy should be reversed. Clearances should go to individuals whose records demonstrate a clear aptitude for security. That is, their background and personal qualities should show a high sense of responsibility—not just the absence of proved disqualifying factors. At the same time, denial of such highly sensitive clearances should not affect the ability to pursue careers in other areas.

A final personnel security issue is the use of polygraph examinations as part of the initial clearance process or in reinvestigations. Since 1983, the Committee has followed closely the various attempts in the Executive branch to widen use of polygraphing for personnel security purposes and congressional efforts to control such practices by statute. The Committee has consistently supported the approach taken by the Senate Armed Services Committee in approving a personnel screening polygraph test program for the Defense Department. That test program is limited to counterintelligence-related questions and has very stringent quality controls and safeguards for individual rights. The same limitation, controls and safeguards should apply to any expansion of polygraphing in other departments and agencies. The National Strategic Security Program should ensure full coordination of departmental policies and practices for this purpose.

The Committee is concerned about the tendency to place an overreliance on the polygraph, thereby allowing apparent passage of an examination to validate the reliability of an individual who may be

Page 498 of 3957

intent on espionage. Other concerns are the persistent underfunding for implementation of some high-quality polygraph programs and the risks that incompetent or improper use of the polygraph may harm the careers, reputations or well-being of loyal Americans. Adequate research on personnel screening polygraph practices is also lacking.

An essential prerequisite for any wider polygraph program in DoD or other agencies is a significant upgrading of the national polygraph training school managed by the Army. This training program should be the focal point for development of a government-wide approach to personnel security polygraph examinations, including equipment requirements, question format, quality controls, and use of individuals as training subjects. A model that should be studied is the Air Force Seven Screens program, which is described in a recent report to the Senate Armed Services Committee. This is a screening program that uses only counterintelligence-related questions and is designed to establish and maintain strict quality controls and respect for individual rights. The establishment of an Oversight and Review Committee and the conduct of regular inspections are especially valuable features of Seven Screens that should be considered for use in other polygraph programs. The Committee is pleased that other sensitive DoD programs are adopting the Seven Screens approach.

The Stilwell Commission recommended that Congress replace the current statutory authority for a limited DoD "test program" with permanent legislation authorizing the use of polygraph examinations for personnel screening with counterintelligence-related questions for DoD personnel. Any such legislation should incorporate standards for quality control and respect for individual rights and should provide a means whereby those standards can be enforced. DoD has prepared draft legislation for this purpose. The legislation deserves serious consideration in the next Congress, after thorough review of the current test program. If Congress does not yet have sufficient test data to decide this issue, then the current test program should be extended for a specific period, at the end of which a decision on permanent authority will be made.

The DoD-proposed polygraph legislation would apply only to the most sensitive positions and would include both quality control and oversight requirements. The Secretary of Defense and the Armed Services Committees would agree in advance to an annual numerical ceiling on examinations to be given, and no adverse action could be taken soley on the basis of polygraph results except with approval at the highest levels in special circumstances. In reviewing this proposed legislation, Congress should consider the adequacy of DoD policy oversight and inspection arrangements to ensure consistent implementation and quality control for all DoD compenents. As recommended elsewhere, this requires augmentation of OSD security policy staff personnel. An oversight and review committee comparable to SEVEN SCREENS should also be considered.

The difficulties with expanding the use of polygraph examinations in DoD and other departments suggest a need for caution at the national policy level. There is widespread misunderstanding about the use of polygraphs for personnel security screening with CI-related questions and strict quality controls. While a uniform

national policy for access to certain types of highly sensitive data is desirable in theory, more needs to be done to explain the procedures and safeguards to federal employees, the Congress and the public and to compile data on employee reactions to such examinations before a government-wide policy is implemented.

Findings and Recommendations

46. Finding.—Defense Department adoption of Stilwell Commission recommendations is a major step forward. The Committee has supported additional funding in FY 1986 and 1987 to accelerate implementation of recommendations regarding clearance investigations.

47. Recommendation.—The National Strategic Security Program should ensure substantially increased funding for personnel security in all relevant departments and agencies. A Government-wide plan should be submitted to Congress to achieve the following goals: (a) elimination of the reinvestigation backlog for Top Secret (including SCI) within four years; and (b) implementation within less than ten years of a program for intensified investigation and reinvestigation for Secret clearances.

48. Recommendation.—Agreement should be reached as soon as possible on a "single scope" background investigation for all Top Secret and SCI clearances. The uniform policy should provide for: (a) less costly and more timely background investigations and clearances; (b) highest priority for meeting the five-year reinvestigation requirement; and (c) a subject interview in all cases.

49. Recommendation.—Government-wide adoption should be considered for the Stilwell Commission recommendations to prohibit the practice of requesting security clearances solely to provide access to a controlled area, where there is no need to know or even to be exposed to classified information. Reliability investigations should still be conducted in such cases, with standards equal to those proposed by this report for Secret clearances.

50. Recommendation.—More effective means should be established for investigating and clearing immigrant aliens and foreign nationals overseas who are granted access to classified information.

51. Recommendation.—Implementation of the proposal for one-time, short duration access by cleared personnel to the next higher level of classified information should be postponed until Secret clearance requirements and investigations are upgraded and the IG–CM(P) has reviewed the issue.

52. Recommendation.—The Executive branch should study the possibility, in consultation with appropriate congressional committees and civil liberties experts, of a program for requiring those who receive access to the most sensitive information to agree to expanded post-access foreign travel reporting obligations and/or agency access to relevant financial and travel records. Such a program would need to be clearly limited and to incorporate proper safeguards regarding the use of the information obtained.

53. Recommendation.—The National Strategic Security Program should increase personnel security research, including expanded research and evaluation on the wider use of psychological testing in the clearance process, taking full account of individual rights, as well as the implications of recent espionage cases.

54. Recommendation.—The President should issue a new Executive Order on personnel security. The order should provide for government-wide minimum standards and procedures and a policy oversight office similar to the Information Security Oversight Office. It should focus exclusively on personnel security programs regarding access to classified information and to sites where classified information is maintained. Drafting of this order should not delay action on other recommendations.

55. Recommendation.—The National Strategic Security Program should improve the adjudication process for granting or denying security clearances, with more rigorous standards regarding persons who have committed felony offenses; follow-up measures where persons with admitted problems like drug use are cleared; and a government-wide requirement for training of adjudicators. For the most sensitive positions, a "select in" policy based on demonstrated aptitude for security should be adopted in place of the current "select out" policy based on the absence of proved disqualifying factors.

56. Finding.—Agency and interagency investigations of recent espionage cases have highlighted flaws in hiring, assignment and termination practices. Recent corrective efforts in CIA and DoD and proposed government-wide consideration of similar measures should be very useful. The Committee will continue to monitor these efforts to achieve needed corrective action without destroying necessary managerial flexibility.

57. Recommendation.—The national Strategic Security Program should ensure full coordination of departmental policies and practices for the use of polygraphing in personnel security screening so as to maintain stringent quality controls and safeguards for individual rights, to prevent over-reliance on this technique, to provide for necessary research and funding, and to improve understanding of the procedures.

58. Recommendation.—Congress should consider permanent legislation authorizing DoD to use polygraph examinations for personnel security screening with CI-related questions, based on the most recent DoD proposal. If a decision cannot be reached in 1987 because of insufficient test data, then Congress should extend the current test program for a fixed period.

59. Recommendation.—The other Stilwell Commission recommendations on personnel security should be implemented vigorously in DoD with augmented OSD policy oversight, and they should be reviewed at the NSC level for adoption government-wide.

C. INFORMATION SECURITY

In December, 1985, the Committee submitted to the National Security Council a series of recommendations on information security, in response to a request for input on proposals developed by the Information Security Oversight Office (ISOO). In addition to calling for a National Strategic Security Program, as discussed above, the Committee urged immediate implementation of the ISOO proposals with strong, public endorsement of the President and the principal members of the National Security Council. The ISOO proposals would establish new information security policies for curbing over-

classification and over-distribution, improving classification management, enforcing the need-to-know principle, and improving security awareness and investigations of unauthorized disclosures. The Committee recommended that senior executives and program managers be held personally responsible for effective implementation of these policies.

Although the ISOO proposals are an excellent agenda for near-term actions, the Committee made several other recommendations for long-term decisions. First, there is a fundamental problem with the classification system because of its complexity. The Committee recommended consideration of a two-level system, based essentially on the current Secret standard and the Sensitive Compartmented Information model used in the Intelligence Community. A two-tier system offers a better chance of enforcing the need-to-know principle and reversing the natural incentives to over-classification.

The Confidential classification should be dropped, with such information either kept unclassified or protected at the Secret level. The initial decision should be whether the information requires protection in order to prevent substantial harm to identifiable national security interests.

The classification threshold should reflect a policy that classifies information only where truly necessary to maintain the national security. The report on Scientific Communication and National Security, issued in 1982 by a panel of the National Academy of Sciences, warned that undue controls can "weaken both military and economic capabilities by restricting the mutually beneficial interaction of scientific investigators, inhibiting the flow of research results into military and civilian technology, and lessening the capacity of universities to train advanced researchers." The 1985 interagency report on Soviet Acquisition of Military Significant Western Technology reiterated the warning that restricting access to scientific data "may also inhibit the United States' own national research effort." As stated recently by former DIA Director Eugene F. Tighe, "[I]f the U.S. security system for handling classified material is to be useful, only data that are critical to the United States' status as a political, economic and military power should be classified." The assumption should be that information is unclassified, unless there is a specific reason for maintaining secrecy.

The higher of the two classification standards should focus on the much smaller universe of data that require special protective measures above and beyond the normal safeguards for classified information. As is the case with intelligence data designated SCI, classification at the second level should be based on a full analysis of the risks of compromise. Such analysis should ensure that special protective measures are imposed only where necessary and are not diluted by applying them too widely. Careful analysis should also provide the elements for more effective security briefings that help senior policy-makers as well as lower level employees understand the consequences of a security breach.

Executive branch officials have noted that many bilateral and multilateral national security agreements are linked to the current system, and that the handling of Confidential-level foreign material at the Secret level will require some investment. The Committee recognizes that this change must be gradual. It is confident, howev-

er, that the declassification of many U.S.-generated documents that do not merit serious protective efforts will result in significant overall savings that can be devoted to better protection of Secret and Top Secret information.

Another concern is that a higher classification threshold would make more documents accessible to people who request them, either directly or under the Freedom of Information Act. However, unclassified information of a sensitive character can be marked "For Official Use Only" to maintain a policy of not releasing such materials routinely or in response to non-FOIA requests. Concern about FOIA, moreover, should not dictate classification management policy, which should be geared to the most efficient protection against hostile intelligence access to truly important secrets. If a case can be made that specific types of unclassified, but sensitive, information should be exempted from the FOIA, Congress should consider appropriate legislation as has been done for certain kinds of Defense Department technical data. This would be in keeping with the report on Scientific Communication and National Security, which called for development of specific criteria to determine whether unclassified scientific research should be protected by means short of classification.

The other information security recommendations sent to the NSC by the Committee addressed the problem of disclosure of classified information to the news media. The Committee is especially concerned about leaks that compromise sensitive intelligence sources and methods. The Committee emphasized the ISOO recommendation that more effective, unclassified educational materials be developed to explain the damage caused by unauthorized disclosures. The more important recommendation was for new procedures for authorized disclosure of classified information to the news media.

The Committee recommended that the NSC confront the pervasive practice of authorized disclosure of classified information on background, without permitting attribution to the source. By executive order, the President should require each agency to establish procedures to be followed whenever an official authorizes the disclosure of classified information to the news media or in any other public forum. The procedures should apply not only to formal statements for attribution, but also to disclosures on background. They should require that a decision be made to declassify the exposed information or that a record be maintained for purposes of accountability when authority is exercised or granted to disclose information that remains classified. The procedures should require consultation with the agency that originated the information and written designation of the officials in each agency who are authorized to communicate classified information to the media, either in person or through an authorized representative.

Some Executive branch officials oppose such procedures as likely to open the floodgates for "authorized leaks." Others want strict enforcement of a policy that any classified information disclosed to the media be officially declassified. The Committee strongly encourages adherence to a policy that officials speak on the record to the maximum extent. Nevertheless, there may well be valid reasons for retaining a background briefing's classified character. Any serious

effort to address the problem of leaks must face the realities of press-government relations. More leak investigations may accomplish little, moreover, so long as authorized background disclosures continue to divert investigators from cases in which administrative discipline, dismissal or legal action is possible. Policies that ignore "authorized leaks" simply reinforce the climate of cynicism that has fostered disrespect for security.

In addition to the recommendations submitted to the NSC in December, 1985, the Committee has several other information security recommendations. Many proposals of the Stilwell Commission on managing and controlling classified information should be considered government-wide. These include recommendations to:

Require, rather than simply permit, challenges to classifications believed to be improper.

Require a higher minimum degree of accountability for Secret documents.

Impose better controls over reproduction equipment used to copy classified information.

Initiate long-term action to develop technical or mechanical controls over unauthorized reproduction.

Reduce unnecessary retention and storage of classified documents.

Prohibit employees from working alone in areas where Top Secret or similarly sensitive materials are in use or stored.

The Stilwell Commission recommendations on special access programs and on National Disclosure Policy for transfers of classified information to foreign governments are particularly important.

The proliferation of special access programs is testimony to the failure of the current security system. ISOO Director Steven Garfinkel testified that "a number of these programs are probably unnecessary," and the Stilwell Commission reported that some actually afford less security protection than ordinary classification requirements. This situation reflects the fact that, too often, there is no real analysis of the hostile intelligence threat to special access programs or of the reasons why normal security standards and procedures offer inadequate protection. As the Stilwell Commission comments:

> [A]lthough the sole rationale for the creation of Special Access Programs under Executive Order 12356 is to provide enhanced security, there is sometimes too little scrutiny of this determination at the time such programs are created. Unless an objective inquiry of each case is made by the appropriate authorities, the possibility exists that such programs could be established for other than security reasons, e.g., to avoid competitive procurement processes, normal inspections and oversight, or to expedite procurement actions.

The Stilwell Commission's proposed policies, standards and controls for special access programs should be adopted government-wide. The development of minimum security standards for all DoD-established special access programs, which was recommended by the Stilwell Commission and has now begun, should end the temptation to use SAPs as a way to avoid normal security requirements.

The assignment of Defense Investigative Service personnel to work full-time at major contractor facilities may reduce the likelihood of problems like those recently revealed at Lockheed regarding protection of information on stealth technology.

Executive Order 12356 on National Security Information should be modified, moreover, to place more controls on the establishment of special access programs and to give the ISOO Director greater authority to conduct oversight and ensure accountability of special access programs. A revised executive order should designate the Secretary of Defense as the sole official entitled to create or continue defense-related, non-intelligence special access programs. There should also be a comprehensive, one-time review and revalidation of all existing special access programs and associated contracts, with each department and agency reporting the results to the ISOO Director who should make an independent assessment for the NSC.

The Committee believes ISOO has made a valuable contribution to better information security, but its small size (10 professionals) unduly limits its ability to conduct oversight inspections and other in-depth evaluations. ISOO's staff should be expanded to include a permanent element to inspect agency practices at all levels of command and management. While ISOO cannot replace internal inspections, it should do more to ensure the effectiveness of agency inspections by sampling on a periodic basis. ISOO should also work closely with the Defense Security Institute to implement the government-wide policy (proposed by ISOO) requiring seminars and training courses for all levels of commanders and managers, in government and industry, to understand information security policy and procedures, especially classification management.

Classification management training should focus, in part, on the fact that the only valid national security reason for classifying information is that a hostile element whose goal is to damage the interests of the United States should not have use of the information. Throughout the government, most classification judgments are made by the "proponent," i.e., the originator or functional manager responsible for the substance of the information. Few classification authorities consider or have a good knowledge of how a hostile element, government or otherwise, would use a particular piece of information to damage U.S. national security interests.

An informal query of government and industrial managers by Committee staff tends to validate the report that managers are often deficient in their knowledge of classification management requirements and procedures. The proliferation of classified documents and the need for greater security has sprawned an entire dictionary of special classification markings and control systems. The rise of these special markings and control systems has tended to generate a false sense of security and also to confuse those who do not fully understand their meanings. ISOO and the DCI should undertake a thorough reassessment of these practices with a view to simplifying the special markings systems.

Special markings help to enforce need-to-know restrictions by warning a reader what accesses are required to read a document. Equally important, however, is a need for clear assignment of responsibility for determining whether someone has a requirement

for access to information about a particular program. ISOO should review current directives and regulations to ensure that such responsibilities are pinpointed and that compliance is audited regularly.

Finally, the Committee does not believe that legislation to enhance criminal enforcement remedies for unauthorized disclosure of classified information would be appropriate this year. After completion of the appeals in the *Morison* case, a reassessment by both Congress and the Executive branch might be in order. The Committee does, however, support continued investigation of unauthorized disclosures within agencies and by the FBI for purposes of administrative discipline as well as criminal prosecution. When Department of Justice guidelines for leak investigations are reviewed pursuant to ISOO's proposal, they should be revised to reflect this policy. Polygraph examinations should also continue to be used in leak investigations on a voluntary basis in accordance with procedures followed in other types of criminal investigations.

Findings and Recommendations

60. Recommendation.—The Executive branch should immediately implement the Information Security Oversight Office (ISOO) proposals, with strong public endorsement by the President and the principal members of the National Security Council.

61. Finding.—The complexity of the current information security system has led to overclassification, employee confusion and ignorance, inability to protect all the information earmarked for protection, and, at least at times, cynical disregard for security.

62. Recommendation.—The Executive branch should consider simplifying the classification system by establishing two levels, eliminating the current Confidential classification. This streamlining should be preceded by consultation with other countries with whom the United States shares security classification agreements.

63. Recommendation.—An Executive Order should be promulgated requiring each agency to establish procedures governing authorized disclosure of classified information to the news media, including background disclosures of information that remains classified. Such procedures should require records for accountability, consultation with originating agencies, and designation of officials authorized to disclose classified information to the media.

64. Recommendation.—The Executive branch should review the Stilwell Commission proposals on managing and controlling classified information for possible government-wide implementation as part of the National Strategic Security Program.

65. Recommendation.—Executive Order 12356 should be modified to require greater controls on special access programs and to give the ISOO Director greater authority to oversee such programs. The Secretary of Defense should have sole authority to approve defense-related, non-intelligence special access programs. The whole government should conduct a comprehensive review and revalidation of all existing special access programs and associated contracts, with an independent assessment by the ISOO Director. Such reviews should be repeated on a periodic basis.

66. Recommendation.—ISOO's staff should be expanded to include a permanent inspection element. ISOO should work with the

Defense Investigative Service to implement improved training courses on information security and classification management. ISOO and the DCI should also reassess special markings with a view to simplification. ISOO should ensure that agencies designate individuals/positions with responsibility for determining need-to-know access.

67. Recommendation.—The Executive branch should postpone consideration of new criminal penalties for unauthorized disclosure until after the appeals in the *Morison* case. The Committee supports continued internal agency and FBI investigations for purposes of administrative discipline as well as prosecution, including use of voluntary polygraph examinations under criminal investigative procedures. Justice Department guidelines for leak investigations should be revised to reflect current policy of using administrative sanctions when prosecution is not pursued.

D. COMMUNICATIONS, COMPUTER, AND EMANATIONS SECURITY

The rapid expansion of electronic systems and equipment capable of very high-speed transmission and storage of large volumes of information offers striking capabilities and opportunities for the United States, particularly in the areas of national defense and intelligence. Equally striking are the security vulnerabilities of such systems, for which Executive branch efforts to develop and implement countermeasures are in their embryonic stage. The Defense Department and NSA have been given the lead in developing national policy for security countermeasures against hostile intelligence efforts to intercept communications, penetrate computer systems, and monitor the emanations from communications and information processing equipment.

Traditionally, communications security meant the encryption of classified communications and the maintenance of discipline to ensure that classified information was not discussed on open lines. In the 1970s, two weaknesses with this approach came to be recognized. First, it was discovered that the Soviets had a massive capability to intercept communications that could be exploited for significant intelligence value, even if the discussions were unclassified.

The second factor was the inherent human weakness of government and contractor officials, at all levels, who inevitably fail to follow strict security rules. The inaccessibility or inconvenience of secure phones, and the ease of slipping into or "around" sensitive topics, meant that security briefings and penalties were simply not adequate to prevent discussion of classified information on open lines.

Congressional concern about communications security has increased with growing public awareness of the threat. In 1985, Congress enacted Senator Moynihan's proposal that the FBI submit a report to Congress on the measures needed to counter the Soviet surveillance threat to domestic communications. This report was submitted in June, 1986, but was limited to the FBI's counterintelligence support role without discussing steps being taken or planned by the National Security Agency's Information Security Directorate to deny the Soviets access to domestic communications.

The NSA communcations security program is described in detail in the annual budget justification submitted to the Intelligence Committee for the first time in 1985. NSA has recently initiated a major program to upgrade communcations security by developing a low-cost, user-friendly secure telephone system. NSA's leadership in working with private industry to develop such a system may lead to a significant security breakthrough. NSA's plans to work with the private sector by licensing use of essential cryptographic techniques in equipment marketed to the public are unprecedented, and the Committee is satisfied with the efforts to take all equities into account. The Committee supports NSA's plans for secure telecommunications equipment, including the idea of making the equipment available to the private sector; it recommends attention at the highest levels to the need for agencies outside the traditional national security arena to join in this program as appropriate. The Committee will continue to exercise budgetary and policy oversight of NSA's communications security program.

In this regard, the NSA is concerned that current plans do not fully respond to the threat to long-distance communications relayed over satellite links and intercepted from sites like the one in Cuba. While the low-cost secure equipment developed under NSA's leadership may solve much of the problem for government agencies and private firms that can afford the cost, many organizations are much less likely to be able to pay the price. Efforts to neutralize the Soviet intercept operations that damage national security should not depend so heavily on the marketplace. Senator Moynihan, former Vice Chairman of the Intelligence Committee, has proposed a $1 billion program to encrypt all domestic communications satellite links. The Committee has asked for and received a five-year NSA plan to protect the most sensitive links that the Soviets could exploit to damage U.S. security interests. This less expensive proposal is to encrypt all dedicated channels leased by federal government agencies, by private firms with government contracts, and by private firms that communicate large financial transactions and economic forecasts. The Soviet could exploit these unclassified links by piecing together information that, taken in aggregate, is highly damaging to the United States. In the Intelligence Authorization Act for FY 1987, the Committee recommends an increase of $129 million for the communications security program above the funds requested by the Administration. More than half of this increase is to begin implementation of the domestic satellite protection plan.

Another threat comes from hostile intelligence efforts to monitor emanations from equipment and/or electrical lines. This problem generally bears the label Tempest, from the term used for the costly shielding and equipment design measures sometimes needed to ensure against compromising emanations. Improvements are being made in definition of the threat and the most cost-effective countermeasures. The initial security standards developed by the Defense Department and the Intelligence Community were based primarily on the theoretical possibility of compromise. A 1983 interagency assessment of actual and probable threats led to refinement of the threat assessment, since the current threat appears much greater abroad than in the United States. The bulk of Tem-

pest expenditures, however, is still being made in the United States.

On June 27, 1986, the General Accounting Office completed a review of domestic DoD and military service adherence to national Tempest policy for the House Committee on Government Operations. The GAO concluded that more than a year after the issuance of the new January, 1984, Tempest policy, the services all continued to follow their older internal Tempest guidance.

The GAO is of the view that the imposition of "Tempest countermeasures on industry should be controlled from a central point within DoD." Also in order to minimize unnecessary Tempest-related expenditures, the report recommends that the Secretary of Defense require all DoD components to conduct Tempest evaluations before implementing Tempest countermeasures in the United States to protect non-SCI information. Both the Stilwell Commission and an interagency body have recommended increased efforts to relate more closely the extent of the Tempest protective effort in the U.S. to the identified hostile collection threat. The expenditure of funds and effort for unnecessary Tempest protection clearly shows the need for better threat analysis and interagency collaboration in developing the communications and computer security aspects of a National Strategic Security Program.

The Committee sees a similar imbalance in resource allocation in the computer security field. Testimony at Committee hearings indicates a disparity in resources between the technological and human sides of the computer security problem. The overwhelming emphasis today is on increasing expenditures for development of more secure equipment and software, rather than on the personnel and information security measures needed to deal with the human side of the problem. The DCI testified that personnel security is "the most important part of any effective security program," yet the Computer Security Center at NSA and the interagency computer security committee (under the National Telecommunications and Information Systems Security Committee chaired by the Assistant Secretary of Defense for C^3I) have focused mainly on hardware and systems design.

The Stilwell Commission, citing the estimate that redressing the damage from the Walker-Whitworth case could cost several billion dolars, went on to warn:

> Given the range of density of information housed in major DoD computer-based systems, the possibility of remotely accessing terminals over great distance, and the difficulty of detecting exploitation by a trusted person, it is entirely conceivable that a computer-wise traitor could cause catastrophic loss of resources and military advantage.

The security officer for one of the larger military logistics computer systems sites expressed the same concern to Committee staff. The Committee is also concerned about the apparent use of a DoD computer system in a scheme to divert parts to Iran.

The trusted-person threat to computer security is not limited to the Defense Department. The State Department has a problem due to the fact that many embassy computer system managers and operators are foreign nationals. In light of the sensitivity of even un-

classified State Department systems, Members of the Committee sponsored an amendment to the Diplomatic Security Act to protect funding for State Department initiatives to replace those personnel with U.S. citizens.

Because of the seriousness of the computer security threat, the Committee urges consideration of the option suggested in a 1985 interagency assessment: "The only recourse may be for the United States to exclude from these data bases the types of science and technology information that are likely to be used against U.S. interests." The National Strategic Security Program should ensure that the computer security and information security communities jointly develop procedures requiring analysis of computer system vulnerabilities before sensitive material is approved for storage in those systems.

Given the gravity of the personnel security problem, the National Strategic Security Program should address the need for more stringent controls on personnel with access to sensitive computer data bases. As a result of the Walker-Whitworth case, special "crypto-access" controls have been approved for personnel with extensive access to classified cryptographic information. Similar controls should be considered for access to the most vital data bases and networks. Furthermore, such positions should have top priority for institution of personnel reliability program measures, as recommended by the Stilwell Commission for DoD personnel involved in especially sensitive programs.

One reason for the apparent imbalance in attention to technological and human aspects of the computer security problem may be the national policy structure that separates communications and computer security from other security functions. In 1984 the President issued NSDD–145, which made NSA the "national manager" for communications and computer security under a new National Telecommunications and Information Systems Security Committee (NTISSC) chaired by the Assistant Secretary of Defense for C3I. NSDD–145 was an important effort to update national policy, because it recognized the close connections between computer and communications security. The Committee endorses the assignment of NSA, working through its National Computer Security Center, to conduct research and develop computer security hardware, systems and standards not only for DoD, but also for the federal civilian establishment and segments of the private sector. The National Bureau of Standards Institute for Computer Science and Technology is cooperating with NSA in transmitting research results throughout the government and to private industry. These efforts should increase.

Computer security is, however, one of the best examples of why a still broader national policy structure is essential to ensure full attention to all aspects of security counter-measures. While NSA has unique technical capabilities, computer security priorities should be addressed as part of the National Strategic Security Program to ensure that research efforts and resource allocation respond to the most serious actual and probable threats. (Another reason for a framework spanning current jurisdictional divisions is that TEMPEST issues relate closely to technical surveillance countermeasrues, as discussed below.)

Recently, fears have been expressed regarding a "big brother" role in NSA's growing involvement with the civilian and private sectors. The Committee believes that NSA is best equipped to develop technical measures needed to remedy serious vulnerabilities in a timely manner. The Committee also recognizes that both the Executive and Legislative branches must continue to exercise oversight to ensure that the Government does not impose technical solutions that impinge on individual privacy, civil liberties or public confidence.

To improve congressional oversight of resource allocation, program priorities and privacy concerns, the Committee instituted a review of the NSA communications and computer security budget requests beginning with FY 1987. The House Intelligence Committee began this practice last year, and the funds were included for the first time in the Intelligence Authorization Act for FY 1986. While these NSA programs are not part of the National Foreign Intelligence Program and thus are within the concurrent jurisdiction of the Armed Services Committee, they also fall under the Intelligence Committee's general mandate in Senate Resolution 400 for oversight of measures taken to protest against the hostile intelligence threat.

Findings and Recommendations

68. Recommendation.—The National Strategic Security Program should ensure that NSA's plan for low-cost, secure voice telephone equipment is implemented by all government agencies, contractors and offices involved with national security information and other technological, political and economic information of significant value to adversaries.

69. Finding.—A program for encryption of domestic commercial communications satellite links that would be the most lucrative targets for hostile interception of private communications is a worthwhile supplement to the secure phone program. The Committee has recommended FY 1987 funding to begin this program.

70. Recommendation.—The National Strategic Security Program should enforce current national TEMPEST policy for all government agencies, so that decisions to buy TEMPEST equipment are based on the best counterintelligence estimates of actual and probable threats.

71. Recommendation.—The National Strategic Security Program should place greater emphasis on personnel, physical and information security aspects of computer security, including research efforts, and should establish relative priorities for all aspects of computer security countermeasures.

72. Finding.—Because U.S. embassy computers and word processing systems may contain sensitive information, Committee Members sponsored an amendment to the Diplomatic Security Act to protect State Department funds to place U.S. citizens in charge of embassy computers.

73. Recommendation.—The computer security and information security communities should review and improve current procedures for analysis of information system vulnerabilities before sensitive material is approved for storage in such systems.

Page 512 of 3957

74. Recommendation.—Given the gravity of the threat, high priority should be given to strict personnel security controls, comparable to the reinstituted crypto-access program and incorporating personnel reliability programs, for persons with extensive access or potential access to sensitive computer systems.

75. Recommendation.—The National Strategic Security Program should provide for national-level review of communication, computer and emanations security resource requirements, with NSA continuing to be responsible for development of technical measures and standards needed to remedy vulnerabilities. The Committee will continue to oversee the level of effort and to ensure that technical measures are not imposed in a manner that impinges on individual privacy, civil liberties or public confidence.

E. TECHNICAL AND PHYSICAL SECURITY

In June, 1985, the Committee heard detailed testimony on the bugging of typewriters at our Moscow embassy and other Soviet technical surveillance operations. This testimony vividly demonstrated the Soviets' strong technical surveillance capabilities and U.S. vulnerability to sophisticated electronic penetration and eavesdropping techniques. Shortly thereafter, the Inman Panel on Overseas Security submitted to the Committee a compartmented annex to its report to the Secretary of State, showing that the technical security threat is a formidable challenge. The Inman Panel stressed fundamental problems for the State Department and recommended both a reorganization of State Department security operations into a new Diplomatic Security Service and a massive rebuilding program for overseas missions. The Moscow embassy discovery and the Inman Panel report have reawakened the intelligence community and the State Department to the threat of hostile technical surveillance.

The Committee recognized after the June, 1985, hearing that U.S. technical surveillance countermeasures (TSCM) had been seriously underfunded in recent years. Consequently, the Committee proposed what became a $35 million FY 1985–86 supplemental appropriation to enhance security countermeasures at U.S. facilities abroad.

The physical security lapses that allowed Soviet access to State Department equipment and the low funding for technical surveillance countermeasures are matters of grave concern to the Committee. As a result, the Committee accompanied its proposal for a supplemental appropriation with a request for a comprehensive long-range plan for upgrading technical security at U.S. facilities abroad. The outlines of such a plan are beginning to take shape.

The Committee is pleased to note the cooperation and progress achieved in this area by Executive branch agencies in 1986. The best way to marshal their energies is, however, to establish a National Strategic Security Program that can take all interests and disciplines into account. Current interagency mechanisms will benefit from being incorporated in this broader and more formal framework. This recommendation is consistent with an interagency assessment that emphasizes the necessity for total protection of information and telecommunications equipment and with the testi-

Page 512 of 3957

mony of CIA's Security Director that "the best security will be achieved through a program that integrates technical security with other security disciplines."

Many agencies play R&D or operational roles in detecting and denying technical penetration by hostile intelligence services. Adequate TSCM planning must do more than just provide an organizational framework and philosophy. It should outline explicitly the vulnerabilities, requirements, objectives, responsibilities, resources and schedule for short and long-term R&D, training, personnel, inspection and other needs. The Committee looks forward to this level of effort in the future.

Implementing the Inman Panel recommendations, the State Department has established a new Diplomatic Security Service so as to give those who manage its security functions higher status, increased resources and a greater voice in Department management. State has also developed a $285 million construction plan to build more secure facilities in Eastern Europe. The State Department is establishing programs, moreover, to ensure that all information processing equipment sent abroad is under strict security controls. These efforts are a sensible response to the vulnerabilities uncovered by the discovery of the bugged typewriters. The Committee has encouraged development of this program, and Members sponsored an amendment to the Diplomatic Security Act that protects funds for it.

Congress should also support the substantial, multi-year expenditures that will be required to implement Inman Panel recommendations for enhanced physical security at U.S. facilities overseas. Congress funded initial requests to improve embassy security against terrorism, including President Reagan's request for a $110.2 million supplemental appropriation for FY 1985 and the Act to Combat International Terrorism (P.L. 98-533), which authorized $366.3 million for embassy security. The urgent supplemental for FY 1987 appropriates over $700 million to begin the new construction and other security enhancements.

The Committee understands that there must be a "rule of reasonableness" in embassy physical security that takes into account the need for openness and the negative effect of a "fortress" image. Nevertheless, policy and design should be flexible enough to respond not only to the terrorism threat, but also to the hostile intelligence threat.

Security expertise in other agencies can contribute significantly to the success of the embassy construction program and it will be important to factor technical security requirements into both the planning and the construction of new facilities. This Committee has worked closely with the Senate Appropriations Committee to provide funds and positions in the FY 1987 urgent supplemental for such assistance to the Foreign Buildings Office of the State Department.

The State Department advises that budget constraints have required modification of the plans for certain construction which originally would have made necessary security improvements in FY 1988. The revised plan stretches out construction work through FY 1990. The Committee urges the Administration to accelerate its

decisions in light of long-range, tailored security plans for each of these missions.

Findings and Recommendations

76. Recommendation.—The Executive branch should continue to place greater emphasis on the development of means and the implementation of actions to detect and defeat technical penetrations of sensitive facilities. The National Strategic Security Program should reconcile the various technical security interests and integrate them with other security disciplines.

77. Finding.—Executive branch actions in 1986 to upgrade security functions and to coordinate technical security efforts have been a notable step forward. They deserve continuing high-level support and resource commitments.

78. Finding.—State Department plans to improve the security of information processing equipment constitute a reasonable approach to the technical penetration problems. Committee Members have moved to ensure that the needed funds to begin these programs are available.

79. Recommendation.—Congress and the Executive branch should support implementation of the Inman Panel recommendations for major site and/or physical changes to U.S. facilities abroad to enhance security, minimize acts of terrorism and prevent hostile intelligence penetration.

80. Recommendation.—The State Department should ensure that security experts in other agencies are given full opportunity to participate in the planning and oversight of new embassy construction efforts to achieve a comprehensive security system. Decisions on long-range, tailored security plans for overseas missions should be accelerated.

F. INDUSTRIAL SECURITY

Espionage cases of the past ten years, involving such industry personnel as Boyce, Lee, Bell, Schuler, Harper and Cavanagh and the loss of sensitive technological information through increasing levels of espionage and illicit transfer, have highlighted the priority that hostile intelligence services attach to U.S. technology. The interagency report in 1985 on Soviet Acquisition of Militarily Significant Technology described the threat, and its findings are confirmed both by Soviet documents obtained by the French and by the testimony of Soviet bloc defectors. Industry is vulnerable to recruitments by hostile services and to employees who volunteer their information for pay. Industrial communications are vulnerable to Soviet interception; and industrial facilities are susceptible to technical penetration, especially overseas. Co-production agreements with foreign firms compound the difficulties.

Hostile intelligence successes in penetrating U.S. industry, culminating in the Harper case, triggered an in-depth review of industrial security programs and policies in 1984 by a DoD Industrial Security Review Committee (also known as the "Harper Committee"). This review was particularly important because DoD has been delegated industrial security responsibility for eighteen federal departments and agencies. The Harper Committee's 25 recommendations

are designed to enhance industrial security dramatically. While not all have been adopted by DoD, the majority are being implemented as proposed or with some revisions. The Committee urges prompt action on the Harper Committee reforms that have been approved for implementation. The National Strategic Security Program should also review those recommendations for government-wide implementation.

Several Harper Committee proposals deserve special emphasis. First is better integration between counterintelligence and industrial security. In the past, there has been a reluctance on the part of the counterintelligence community to communicate with industrial security officers. While such communication is improving, particularly in security awareness programs such as the FBI's DECA program, there is ample room for closer cooperation. There should be a continous two-way sharing among counterintelligence agencies and government and industrial security officers. Counterintelligence agencies should provide more tailored information on the hostile intelligence threat to particular programs or types of programs, as well as in particular geographical areas, for use in security awareness efforts and the design of security measures.

A pilot program should be initiated for assignment of Defense Investigative Service personnel to large sensitive contractor facilities on a full-time basis, and the National Strategic Security Program should review the results as a basis for considering a similar government-wide practice. With 95 percent of all classified documents (an estimated 15 million out of 16 million) residing with only 4 percent of the cleared industrial contractors, the case for a continuing government security presence at those facilities is strong. It is further enhanced by the admissions of the Chairman of the Board of Lockheed regarding the sloppiness of the company in accounting for classfied documents. A GAO investigation had revealed that Lockheed was unable to account for nearly 1,500 documents due to inadequate controls. A reordering of priorities to concentrate on major contractors will not result in the government taking over contractor security functions, but rather will permit timely audits of security functions and correction of problems in primary facilities.

As discussed in the section on personnel security, a single-scope background investigation for Top Secret and SCI clearances would especially benefit industrial security. The five-year goal for clearing up the backlog of periodic reinvestigation for Top Secret and SCI, if applied government-wide, would similarly benefit contractors who are on the leading edge of U.S. intelligence technology. The Committee has added funds to agency budgets for this purpose on more than one occasion.

Industrial security managers have had to cope with tremendous needs for, and resultant delays in, clearance investigations for industry. With the large defense buildup in recent years has come a dramatic rise in the number of contractor personnel holding security clearances. Between FY 1978 and the end of FY 1985, the number of such clearance investigations per year increased from 28,000 to 75,000. The Defense Department's recent twenty-percent reduction in clearances should help ease this burden.

Page 516 of 3957

Federal Acquisition Regulations should be changed to designate security requirements for classified contracts as a direct cost. When security is designated as a direct cost instead of an overhead cost, industrial security officers are relieved of the opposing pressures of the government-customer who demands more and better security and the company officials who see security as a drain on profitability. In addition, the designation of security as a direct contract cost will force the customer to more precisely define his security requirements in the Request for Proposals (RFP) and in security deliverables. While this approach may appear more costly to the taxpayer, in the long run it will result in greater cost savings through effective planning and cost controls.

Consideration should also be given to the greater use of Cost Plus Award Fee (CPAF) contracts as an incentive for fulfilling contract security requirements and specifications on time, within cost and without security violations. Making security a major award fee determinant along with the other award fee elements will give contractors for classified contracts the motivation for ensuring that more and better-qualified security planning and operations personnel are assigned and retained on contracts.

Training and government certification of all current and planned contractor security officers should be required in each classified contract. As pointed out in the Harper Committee report, the intense targeting by hostile intelligence services of the large amount of classified data entrusted to contractors, as well as the absence of a formal training program for industrial security officers, justifies the government's establishment of this requirement. The requirement for training and certification should also apply to personnel with security responsibilities for special access program contracts.

A final and most disturbing concern is the hostile intelligence threat to foreign subsidiaries of U.S. firms and to foreign firms that have co-production agreements with the United States. Although U.S. counterintelligence efforts abroad, both unilateral and in concert with our allies, can help deal with this problem, it also requires national policymaker attention. The Stilwell Commission warned specifically of the critical problem with co-production arrangements, "where losses could entail not only the end-item being produced but also the technical 'know-how' necessary to manufacture it in large quantities." Other weaknesses identified by the Commission include insufficient controls in the sale of classified weapons systems and ineffective security surveys. The Committee fully endorses the Stilwell Commission's recommendations for improving the National Disclosure Policy, which governs transfer of classified military information to foreign recipients. The following approach would be required in approving classified transfers:

(1) requiring a determination that the need of the recipient cannot be satisfied by unclassified systems or data;

(2) if classified systems or data are required, then requiring selection of a model or type of such system that minimizes the need to transfer classified information;

(3) requiring phasing in of the most sensitive classified information over time, if feasible;

Page 516 of 3957

Page 517 of 3957

(4) avoiding co-production of military systems which involve the manufacture of the most advanced version of classifed components or end-items.

In addition, security surveys would be conducted by a permanent professional staff with flexibility to meet pressing needs for in-country security assessments. The National Strategic Security Program should ensure that such improvements are implemented not only for military information, but for sensitive intelligence and nuclear matters as well.

Findings and Recommendations

81. Recommendation.—The National Strategic Security Program should foster better communication between U.S. counterintelligence agencies and industrial security officials and provide more tailored information on the hostile intelligence threats to particular programs or areas.

82. Recommendation.—DIS should initiate a pilot program for assignment of its personnel to large sensitive contractor facilities on a full-time basis, and the results should be reviewed as a basis for a similar government-wide practice.

83. Finding.—Recently adopted goals for ending the reinvestigation backlog for contractors holding Top Secret and SCI clearances who are currently involved in sensitive classified contracts merit high-level commitment and support.

84. Recommendation.—Federal Acquisition Regulations should be changed to designate industrial security for classified contracts as a direct cost. The primary intent of this proposal is to identify and monitor security costs associated with particular contracts.

85. Recommendation.—Consideration should be given to greater use of Cost Plus Award Fee contracts as an incentive for fulfilling contract security requirements.

86. Recommendation.—Trained and government-certified security officers should be required in each classified contract, including those for special access programs.

87. Recommendation.—The National Strategic Security Program should ensure implementation of the Stilwell Commission recommendations on National Disclosure Policy not only for military information, but for sensitive intelligence and nuclear matters as well.

88. Recommendation.—Other Harper Committee recommendations approved by DoD should be implemented promptly and reviewed for government-wide application.

G. CONGRESSIONAL SECURITY

In December, 1985, Randy Jeffries, an employee of a private firm that transcribed classified hearing transcripts for congressional committees, was arrested for attempting to sell classified material to Soviet intelligence. The FBI detected the employee making contact with the Soviet Military Office in Washington. The employee admitted giving the Soviets excerpts from a classified transcript of a House Armed Services Subcommittee hearing on Defense Department command, control, communications and intelligence programs. The subsequent FBI investigation revealed that the employ-

Page 517 of 3957

Page 518 of 3957

ee had been observed by a co-worker removing classified documents from the firm under his coat and that a friend of his had destroyed a locked briefcase given to him that possibly contained classified documents. Jeffries pleaded guilty in January, 1986, to a charge of supplying national security documents to a person not entitled to receive them. This offense carries a maximum sentence of ten years in prison.

The case highlights the fact that Congress is not immune from the espionage problems that have surfaced throughout the government in recent years. Both Executive branch and congressional inquiries have emphasized the need to enhance congressional security in response to espionage threats. In November, 1985, the Stilwell Commission expressed the following concerns about the handling of classified information by Congress:

> [A]lthough Executive Order 12356 provides that departments and agencies may disseminate classified information to persons outside the Executive branch provided such information is given "equivalent protection" by the recipient, DoD elements frequently provide classified information to the Congress without any understanding of how such information will be protected. While all congressional staff members who receive access to classified DoD information are, in theory, cleared by DoD, little attention is given the handling and storage of such information by congressional staffs, who are not, in fact, bound by the safeguarding requirements of Executive Order 12356.

The Stilwell Commission recommended that the Secretary of Defense take the following actions:

> Urge the President of the Senate and Speaker of the House of Representatives to adopt, for each House of Congress, rules to provide uniform minimum control over classified information provided by departments and agencies of the Executive Branch. Volunteer to provide DoD resources and assistance to Congress to achieve this goal.

In January, 1986, the Report on the Federal Government's Security Clearance Programs by the Permanent Subcommittee on Investigations of the Senate Committee on Governmental Affairs addressed this subject in the following observation:

> Congress must also focus on problems dealing with classified information in the legislative branch. For the most part, there are no established standards and procedures. Personal offices and Committee practices vary widely in terms of their handling of clearances and classified material. There are few, if any, checks in this system. We believe an overall review of security procedures in the legislative branch should be conducted by the Rules Committee, in consultation with the Intelligence Committee, with a goal of recommending improvements where needed.

The Chairman and Ranking Minority Member of the Subcommittee, Senators Roth and Nunn, addressed this issue through preliminary letters to the Senate leadership.

Page 518 of 3957

The Senate Intelligence Committee has received information from the FBI and other U.S intelligence agencies regarding the operations of the intelligence services of Communist countries directed at Members of Congress and their staffs, including attempts to recruit or place agents in Congressional offices. Electronic surveillance of domestic communications by foreign countries also poses threats to Congress. Only a few congressional offices have secure telephones linked through the Executive branch system.

The information provided to the Intelligence Committee about the espionage threat to Congress indicates a continuing pattern of activity designed to exploit vulnerabilities in security. In three cases over the past ten years, the FBI has uncovered and disclosed publicly Soviet bloc attempts to recruit and place American citizens as agents inside Congressional offices. U.S. counterintelligence successfully prevented any damage in the following cases:

In 1976 a political scientist employed by the Atlantic Council, James Frederick Sattler, was revealed to be attempting to secure a position with a House Foreign Affairs Subcommittee, after being recruited and trained as an espionage agent by East German intelligence.

In 1980 a former CIA case officer, David Barnett, was prosecuted for espionage based on evidence that he had sold CIA information to Soviet intelligence and had attempted to gain employment with the Senate and House Intelligence Committees on the instructions of Soviet intelligence.

In 1982 a staff assistant to a House Member reported to the FBI an effort by Soviet intelligence to recruit him as an agent. At the FBI's request, the staff member became a "double agent" to learn more about Soviet intelligence techniques and aid U.S. counterintelligence.

In other cases, which have not been disclosed by the FBI, there is additional evidence of espionage targeting of Congress by Communist intelligence services.

In more general terms, the FBI has described the techniques used to penetrate the Congress. Communist countries assign intelligence officers to the United States as diplomats, journalists, trade representatives, and in similar capacities. Some of these intelligence officers are instructed to cultivate associations with Members of Congress and congressional staff for the purpose of developing confidential relationships. A well-trained intelligence officer knows how to approach individuals so as not to appear in any way hostile or threatening. Sophisticated and skillful intelligence officers can establish relationships that seem entirely innocent. Professional, academic or social contacts lead to friendships without any suggestion by the intelligence officer of anything illegal or improper. Only when the intelligence officer has learned enough about an individual's vulnerabilities will an effort be made to exploit the relationship.

Lax security practices offer greater opportunities for an intelligence officer to succeed in compromising a congressional staff member. Unlike Executive branch personnel, congressional staff have no requirement or established procedure for reporting contacts with representatives of Communist countries. In some cases,

Members or their staff do report such contacts to the FBI, but the record is very uneven.

The purpose of contact reports is to assist the FBI's investigations of suspected foreign intelligence officers. The FBI has advised the Intelligence Committee that its investigations of suspected intelligence officers disclose many contacts with individuals who, after further inquiries, are found to be congressional staff. Contact reports save the FBI much time and effort, as well as enabling it to advise staffers on how to handle such contacts. That agency has raised with the Intelligence Committee the need for a more formalized procedure in the Senate for briefing staff on the espionage threat and for reporting contacts with representatives of Communist countries.

Another matter that the FBI has discussed with the Intelligence Committee is the handling of classified documents in the personal offices of Members. The FBI has offered to develop both classified and unclassified briefings on the espionage threat to Congress from the intelligence services of Communist countries. The Defense Department, which is responsible for most of the security clearances for congressional staff, might be an appropriate source of assistance in briefing staff on the handling of classified materials.

In an effort to address issues related to Senate classified information security, the Senate Sergeant at Arms, in November, 1985, circulated a Senate Select Committee on Intelligence questionnaire to all Members' personal offices and Committees of the Senate. The results of that questionnaire were not encouraging. Based on responses from 60 Senators' offices, the following conclusions can be drawn:

There is confusion about the levels and sensitivity of the classified information received in personal offices.

There is no uniform procedure followed for storage or control of classified information in personal offices.

Staff with clearances in personal offices rarely receive security indoctrinations or other security education.

As a result of the security survey and the foreign intelligence threat to the Congress, the Senate Select Committee on Intelligence, together with the leaders of the Committee on Rules and Administration and the Committee on Governmental Affairs, determined that the key to addressing the Senate's information security problems lies in the creation of a central office within the Senate to develop and oversee much-needed standards and procedures on important personnel security and information security issues.

The security assistance that a central office would provide includes:

Receiving, controlling, transmitting, storing and destroying classified material.

Processing clearance requests for personnel of the Senate.

Maintaining a centralized record of clearances held by personnel of the Senate.

Presenting security briefings and debriefings for the benefit of Senate personnel.

Consulting on security issues with the personal offices and committees.

64-268 O - 86 - 4

Conducting administrative liaison with other U.S. Government agencies on behalf of the Senate.

A particularly troublesome question relating to classified information security is the large number of Senate staff having access to classified material. The Senate security office should be required by resolution to conduct a comprehensive survey of all Senate offices to determine which officers and employees hold security clearances. The director would report this information within 90 days to the Majority and Minority Leaders along with comments and/or recommendations as to the feasibility of reducing the number of Senate staff with security clearances.

Another early task of the proposed office should be to devise a Senate Security Manual whose provisions, if approved by an oversight group and the full Senate, would be binding on all Members, Officers and employees. The Committee has provided to the Senate leadership a draft Senate security manual to serve as a basis for discussion which is reprinted in Appendix G to this Report. The draft security manual contains standards and procedures both for the handling of classified information and for personnel security.

Findings and Recommendations

89. Finding.—Hostile intelligence services have attempted to penetrate the staffs of Senate and House Members and Committees. Hostile services use sophisticated techniques to develop contacts that can lead to intelligence recruitments.

90. Finding.—Lax security practices in the Senate increase the risk of compromising sensitive information. There is no requirement or procedure for reporting contacts with representatives of Communist countries. There are no established procedures for handling classified information, especially in Member offices. There is no accountability for the handling of such information, and there is great confusion about the sensitivity of the information and what should be done with it. There is no central point where the number of Senate employees with security clearances is tallied or where such services of common concern as security briefings and day-to-day information security assistance are provided.

91. Recommendation.—The Senate should establish a central security office to develop and oversee standards and procedures on important personnel security and information security issues.

92. Recommendation.—A central security office, once established, should immediately survey all Senate offices to determine which offices and employees hold security clearances. This information should be reported within 90 days to the Majority and Minority Leaders along with comments and recommendations on the feasibility of reducing the number of Senate staff with security clearances.

93. Recommendation.—The proposed office should develop a Senate Security Manual, the provisions of which would be binding on all Members, Officers and employees.

94. Recommendation.—All Members and employees of the Senate should be encouraged, and employees with security clearances required, to report contacts with Communist country officials or other suspected foreign intelligence officers. The central security

Page 522 of 3957

office should establish a procedure for such reporting, either through it or directly to the FBI.

95. Recommendation.—Further recommended items for consideration by the Senate security office include: establishment of a Senate corps of cleared employees for transcribing and reporting classified hearings; and improvement in the communications security of telephone conversations, classified computer data, and face-to-face discussions of a sensitive nature.

APPENDIXES

APPENDIX A

UNITED STATES DISTRICT COURT, NORTHERN DISTRICT OF CALIFORNIA

UNITED STATES OF AMERICA, PLAINTIFF,

v.

JERRY ALFRED WHITWORTH, DEFENDANT.

Criminal No.: 85-0552 JPV

Affidavit of Rear Adm. William O. Studeman, Director of Naval Intelligence

1. I am William O. Studeman, a naval officer presently holding the rank of Rear Admiral. I was commissioned an Ensign in the Navy in 1963, and have served virtually continuously on active duty as a naval intelligence officer since that time. My present position is that of Director of Naval Intelligence, which I have held since September 1985. As Director of Naval Intelligence, I am responsible for the collection, analysis and distribution of intelligence information within the Naval Service. I am the Navy's sponsor for counterintelligence programs executed by the Naval Security and Investigative Command, under the policy auspices of the Office of the Secretary of Defense. I offer this affidavit to the Court for use as it deems appropriate in constructing an appropriate sentence for the defendant in this case.

2. The defendant in this case, formerly Senior Chief Petty Officer Jerry Alfred Whitworth, served the United States Navy for 24½ years, 18 of which were in the rate of Radioman, rising to the rank of Senior Chief prior to his retirement. The primary function of a Radioman is to provide and maintain the ability of Department of Defense and naval forces to communicate with each other as well as senior and subordinate commands. Unlike the navies of old, virtually all the information required to plan, operate, command, maintain, modernize, repair, replenish, warn, inform and control the military forces of all the services and our allies is exchanged electrically via communication systems, most of which are considered secure by virtue of their cryptographic cover. Electrical distribution of naval messages is an essential backbone activity designed to reach all levels of command in the Navy. This naval communications system is operated by some of our brightest people who are given the tools, training and sacred trust to protect the vital high technology systems and access to sensitive secrets which are placed

Page 523 of 3957

in their hands. It is important, therefore, to understand the vulnerabilities inherent in naval communications, to understand the concept of crytographic support to communications security (COMSEC) and to understand how Radioman Senior Chief Jerry Whitworth's violation of his trust as a member of the elite fraternity of naval communication professionals has resulted in unprecedented damage to the Navy and the nation.

3. Cryptographic systems are designed to encipher information so that only the holders of the system will be able to decipher that same information. Contemporary crypto-equipments accomplish enciphering and deciphering on the basis of complex mathematical formulas called "logic", which are designed as an integral part of the system with changeable additives called "key". To decipher an intercepted message, an adversary must know both the logic and the key of the cryptosystem used to encipher it. Since it is effectively impossible to ensure that the logic of a cryptosystem will not be compromised during the years it remains in effect, the security of our machine cryptosystems depends on ensuring the integrity of the associated key and the personnel who care for the system. "Key" literally will unlock the secrets contained in encrypted communications.

The ultimate vulnerability of cryptosystems and all procedures designed to protect sensitive information lies at the human level. For this reason, personnel chosen for communications-related duties are carefully screened and indoctrinated in the especially sensitive nature of the positions they hold and the fiduciary-like nature of the trust placed in them. No system ever designed can be invulnerable to the corrupt, cleared individual who has access to sensitive information. Thus, we depend on an individual's integrity and deterrence of the law to ensure that this trust is fulfilled.

4. The importance of key was amply demonstrated by the evidence in this trial. The Soviets were clearly willing to pay a high price for key—more than $300,000 for the defendant alone. But the price paid by the Soviets pales in comparison to its worth. Naval intelligence analysis has led us to conclude that the Walker-Whitworth espionage activity was of the highest value to the intelligence services of the Soviet Union, with the potential, had conflict erupted between the two superpowers, to have powerful war-winning implications for the Soviet side.

5. The importance of the individual spy cannot be overestimated in this type of intelligence acquisition. When an adversary covertly obtains the protective key supplemented by large volumes of actual messages, he can potentially read any or all intercepted messages which that key protects. In the case of Navy operational command circuits, this can be literally hundreds of messages per key setting, many of which are vital to the national security of the United States. Normally, the information contained in those encrypted messages could be expected to include, at a minimum, further plans, ship locations and transit routes, military operations, intelligence activities and information, weapons and sensor data, naval tactics, terrorist threats, surface, subsurface and airborne doctrine and tactics, and similar information which could prove of incalculable value to hostile powers. Undetected theft of cryptographic key by persons intent on penetrating COMSEC safeguards can have ex-

Page 525 of 3957

tremely dire consequence to the defense posture of the nation. History is replete with examples of the benefits and risks associated with COMSEC made vulnerable by espionage or otherwise penetrated for the benefit of one side or another. Such vulnerabilities sustained over time have altered the course of history and can do so again in the future.

6. With respect to this specific case, the sheer volume of encrypted data compromised to the Soviet Union makes it impossible to describe all of that data with specificity. The Court has already heard a few of the specifics during trial; therefore, in paragraphs 7-9, I will simply describe generically the types of information which have likely been traded to the Soviet Union through the years of this espionage enterprise. I will briefly mention some of the more significant aspects of the defendant's activities. I will also provide to the Court certain conclusions I have drawn concerning these compromises. My conclusions are based on my twenty-four years experience as a naval officer, as both a user and producer of intelligence information, and on my current responsibilities as Director of Naval Intelligence and the Senior Intelligence Officer for the Department of the Navy.

7. *Ship location and transit information.*—This is perhaps the most common type of information transmitted over naval communications circuits. On any given day the transit passages and locations of numerous naval vessels, both U.S. and allied, will be transmitted in encrypted radio traffic. Normally, this type of data is held confidential until the information is no longer valid. The reasons that ship locater information is temporarily classified are three-fold. First, simple prudence dictates that the location of ships of the line be held confidential while that sort of information can enhance their vulnerability. This is especially true during periods of hostility. For example, during the Vietnam era, compromises of this type of information could have been responsible for ineffective air strikes, downed aircraft, abandoned targets and infantry losses. It is also particularly true today when U.S. and allied vessels pose a lucrative target for terrorist attack. Secondly, the location and transit routes of naval vessels can be valuable information leading to disclosure, either directly or by informed analysis, of naval doctrine and tactics. This, in itself, could prove to be decisive to the outcome of an engagement at sea. Finally, the rationale that persuades the United States to maintain the confidentiality of ship movements is universally shared by allied nations. Disclosures of transit movements of our allied navies would be as potentially harmful to them as to our own ships; therefore, inappropriate disclosures of such information resulting from breaches of U.S. security could reasonably be expected to have some adverse impact on both foreign relations and on international military cooperation.

8. *U.S. Naval operations information.*—The volume of communications traffic concerning naval plans and operations is large. As with the previous section, analysis of naval plans and operations information can lead, either directly or by informed analysis, to disclosure of naval excerises, contingency activities, and future combat operations which can be exploited to the advantage of a hostile power. In addition, communications will invariably reveal classified technical information, intelligence data, intelligence sur-

Page 525 of 3957

veillance activities or information critical and potentially harmful to the foreign policy of the United States. It would directly reveal substantive information used by the United States in making decisions concerning the security of the nation and its foreign policy. If a hostile power were to obtain that information, it would be possible to turn this newly acquired information to the disadvantage of the United States, either by adopting measures to counter the advantage otherwise available to the United States, or by inserting misleading data into the collection process. An indirect benefit of obtaining this information would be the ability to analyze it for intelligence value, and to inferentially extrapolate the location and concentration of resources dedicated by the United States to obtaining similar information worldwide. Thus, disclosures of specific data can lead to harmful results, both for the specific collection activity involved, and also for similar activities conducted worldwide by U.S. forces and other agencies of the government.

9. *Special category (SPECAT) information.*—Frequently it is necessary to transmit information which is of such a degree of sensitivity that its disclosure must be limited to only those individuals with an absolute need to acquire the data. One method of restricting access to especially sensitive information is to permit its dissemination only within special, restricted channels of communication called Special Category (SPECAT) channels. The defendant was on several occasions in a position to have access to SPECAT communications and had the ability to transfer the information to the Soviet Union.

Some examples of operations that are planned and executed through SPECAT channels are:

a. Covert Military Operations: Disclosure of communications concerning covert operations jeopardizes the United States' ability to conduct missions vital to the national defense and world peace. The risks involve not only extreme embarrassment to our government, but also danger to the lives of the personnel involved.

b. Counterintelligence Operations: Only through the aggressive pursuit of counterintelligence initiatives such as double-agent operations, surveillance, and eavesdropping can the United States protect itself from the threat of espionage conducted against our defense establishment. Disclosure of SPECAT communications concerning such operations allows hostile intelligence services to develop countermeasures and techniques to render these operations ineffective.

c. Human Intelligence (HUMINT) Operations: HUMINT is unquestionably the most fragile of intelligence sources, due to the difficulties in recruiting human agents, the ease with which they are lost, the personal danger often involved and because the quality of information is entirely dependent on the abilities of the individual recruited. Disclosure of any information relating to HUMINT operations, even the intelligence report derived from HUMINT can lead to loss of the source, personal harm to the agent and the insertion of false and misleading information through the agent once the target organization becomes aware.

Page 527 of 3957

10. Based upon an analysis of Whitworth's access to classified information during his participation in the espionage scheme, on the trial testimony, and on debriefings conducted by the Office of Naval Intelligence, we wish to point out certain areas of concern:

a. Mr. Whitworth met with John Walker two to four times per year between 1976 and 1985, and supplied Walker with between twenty-five and fifty rolls of Minox film at each meeting. Since the rolls were undeveloped, Walker cannot assure us of their content, but he believes that it was largely photographed key material. The amount of money paid by the Soviets corroborates that belief. Whitworth was originally paid $2,000 per month for the material he supplied, however, this was subsequently increased to $4,000 and then $6,000 per month later in the conspiracy.

b. We also know that Whitworth compromised detailed plans for primary, secondary and emergency communications circuits which are used by the National Command Authority to maintain contact with operational units. With this knowledge, an adversary can gain significant advantage during crisis events or hostilities.

c. Whitworth also compromised operational military plans, operations orders, and operational message traffic over a significant period of time. For example, he provided the Soviets with a full year of operational message traffic from the USS Enterprise, including TOP SECRET information. He also compromised the operations order for Fleet Exercise 83–1, a unique exercise conducted near the Soviet coast by three carrier battle groups. We believe that he also compromised the communications plan for all U.S. naval forces in the Indian Ocean and all littoral nations.

11. Most importantly, the activities of Jerry Whitworth, continuing as the principal agent of collection for John Walker, permitted the Soviets to gauge the true capabilities and vulnerabilities of the U.S. Navy. The U.S. Navy is a technology-intensive service, conducting sophisticated and often sensitive operations using highly advanced warfare capabilities. Soviet access to those operations and capabilities provided them with the motivation to dramatically improve the Soviet military posture, and identified the specific steps which could achieve the largest gains relative to the U.S. It allowed them the focussed insights required to reduce their own vulnerabilities while simultaneously increasing the vulnerability of the U.S. We have seen clear signals of dramatic Soviet gains in all naval warfare areas, which must now be interpreted in light of the Walker-Whitworth espionage conspiracy conducted over approximately two decades. Mr. Whitworth's role was all the more important because of the new directions taken by the U.S. Navy during his years of collection for the Soviets. For example, through Whitworth the Soviets were able to monitor the U.S. Navy transition to use of satellite systems as its principal communication network.

12. In conclusion, the U.S. Navy and the nation have been seriously wounded by Jerry Whitworth's breach of faith and honor wherein he agreed to sell the secrets with which he was entrusted to a foreign power for personal gain. His misuse of a position of trust in naval communications has jeoparized the backbone of this

Page 527 of 3957

country's national defense. Recovery from the Walker-Whitworth espionage will take years and millions of taxpayer dollars. Even given these expenditures, we will likely never know the true extent to which our capabilities have been impaired by the traitorous and infamous acts of Jerry Whitworth.

WILLIAM O. STUDEMAN,
Rear Admiral, United States Navy.

Subscribed and sworn to before me this 25th day of August 1986.

PATRICK A. GENZLER,
Lieutenant Commander,
Judge Advocate General's Corps, United States Navy.

Notary service provided in accordance with 10 U.S.C. sec. 936.

UNITED STATES DISTRICT COURT, NORTHERN DISTRICT OF CALIFORNIA

UNITED STATES OF AMERICA, PLAINTIFF,

v.

JERRY ALFRED WHITWORTH, DEFENDANT

CR. No. 85-0552 JP

I, John L. Martin, declare under penalty of perjury that the following is true and correct:

1. I am Chief of the Internal Security Section of the Criminal Division of the United States Department of Justice in Washington, D.C. As such, I am responsible for the supervision of all investigations and prosecutions of violations of the espionage law. In the performance of my official duties, I am routinely briefed on foreign counterintelligence matters by the agencies of the United States intelligence community including the Federal Bureau of Investigation, Central Intelligence Agency and National Security Agency.

2. By virtue of my position in the Department of Justice, I am aware of the facts surrounding the defection to the United States in July, 1985, of Admiral Vitaly Yurchenko, then a high official of the primary Soviet intelligence agency, the K.G.B. (Committee for State Security). The information set forth in this declaration was provided to me by United States government officials who were responsible for debriefing Admiral Yurchenko.

3. Vitaly Yurchenko defected to the United States by voluntarily walking into the United States Embassy in Rome, Italy, in July, 1985. Yurchenko was at that time a 25-year veteran of the K.G.B., having attained a military rank in the Soviet Navy of Admiral and serving since March of 1985 until his defection as Deputy Chief of the First Department of the First Chief Directorate. The First Chief Directorate of the K.G.B. is responsible for the clandestine acquisition of intelligence outside the Soviet Union, and the First Department of that Directorate is responsible for such activities in the United States and Canada. Previously, Yurchenko served as Chief of the Fifth Department of Directorate K of the K.G.B., where he supervised internal security matters, including cases involving suspected espionage by K.G.B. officers. Yurchenko had various responsibilities for internal security matters for a ten year

Page 529 of 3957

period, including a five-year assignment from 1975 through 1980 as principal security officer at the Soviet Embassy in Washington, D.C. In that position, he was in charge of liaison between the embassy and United States law enforcement officials concerning the security of the embassy, and had responsibility for assuring the loyalty and security of K.G.B. officers asigned to the Embassy. During his career, Yurchenko was the recipient of many awards and decorations. In July, 1985, shortly before his defection, Yurchenko received the K.G.B.'s highest honor, the title of "Distinguished Officer of the Organs of State Security."

4. One of Yurchenko's responsibilities as a Deputy Chief of the First Department of the First Chief Directorate was to review and supervise the handling of important cases in the United States and Canada. Moreover, because of his previous experience and expertise in matters of security in the K.G.B., Yurchenko was frequently consulted when K.G.B. officers came under suspicion of having been compromised.

5. As the evidence in the trial of this case showed, John Anthony Walker, Jr. was observed making a "drop" of classified information to a Soviet intelligence officer on May 19, 1985. He was promptly arrested and charged. Publicity concerning his arrest was widespread. It was also widely publicized that Walker's former wife, Barbara Walker, had tipped the FBI to Walker's espionage months before his arrest.

6. Soon after Walker's arrest and the attendant publicity, Yurchenko was briefed and consulted about the Walker case. The K.G.B. did not believe that the FBI had been tipped by Barbara Walker and suspected that one of the K.G.B. officers directly involved with Walker had been compromised by Western intelligence agencies. Because of his expertise in internal security matters, Yurchenko's advice was sought with regard to the appropriate course of action for dealing with the suspected compromise. In his position in the First Department, it was also appropriate to brief him concerning the Walker/Whitworth case. Because of the high degree of compartmentalized protection given to a case like Walker-Whitworth, Yurchenko, despite his previous assignments involving internal security and at the Soviet's United States Embassy, had not previously been aware of the Walker/Whitworth operation.

7. From his briefings, Yurchenko learned that the K.G.B. regarded the Walker/Whitworth operation to be the most important operation in the K.G.B.'s history.

8. Yurchenko stated that the information delivered by Walker enabled the K.G.B. to decipher over one million messages. Early on, operation was transferred to Department Sixteen of the K.G.B, which handles only the most sensitive and important clandestine K.G.B. operations around the world.

9. The K.G.B. officers who handled the operation received important promotions and decorations for their successes. One of these officers secretly received the "Hero of the Soviet Union" award after the Soviet Navy expressed its delight over the success of the operation. Two other K.G.B. officers involved with the Walker/Whitworth operation were awarded the coveted "Order of the Red Banner." Certain K.G.B. officers from Department Sixteen were, at various times, assigned to the Soviet Embassy in Washington solely

Page 529 of 3957

Page 530 of 3957

to handle "drops" made in connection with Walker/Whitworth espionage. The most recent of these, Aleksey Tkachenko, was returned to the Soviet Union when Walker was arrested.

10. Yurchenko was informed by a high K.G.B. official that the information learned from the Walker/Whitworth operation would have been "devastating" to the United States in time of war.

Dated: August 26, 1986.

JOHN L. MARTIN,
Chief, Internal Security Section, Criminal Division.

APPENDIX B

[From the Defense Security Institute Security Awareness Bulletin, August 1984]

PARTNERS IN ESPIONAGE

THE CASE OF JAMES HARPER AND RUBY LOUISE SCHULER

An American named "Jimmo" sporting an Irish Brotherhood medallion meets a Polish intelligence agent called "Jacques" at the Museum of Anthropology in Mexico City—such is the international, and distinctly bizarre, flavor of the latest espionage case to hit the Defense Industrial Security Program.

This is the case of James Durward Harper who was sentenced to life in prison, with a recommendation that he never be paroled, on May 14, 1984. He had pleaded guilty in April to selling classified documents to the Polish Intelligence Service. The material, classified up to Secret, pertained to survivability of the Minuteman missile system and to U.S. defenses against attack by ballistic missiles.

Harper was a self-employed electronics engineer in Mountain View, California. He first became involved with the Poles in 1975 when a business associate, William Bell Hugle, introduced him to Polish agents seeking U.S. electronics technology.

Harper was at that time running a small firm, which made and marketed the world's first digital stopwatches. He sold technologi-

cal information to the Poles for several thousand dollars. During this period, Harper did not hold a security clearance and had no direct access to classified information.

But in May 1979 Harper began what appears to have been a sort of "business-romance" with a woman named Ruby Louise Schuler. She held a Secret clearance as executive secretary to the president of Systems Control Inc., (SCI) in Palo Alto, California, a Defense contractor doing research for the U.S. Army Ballistic Missile Defense Advance Technology Center, Huntsville, Alabama. Schuler agreed to provide documents to be copied and sold. Harper contacted Hugle who, in return for a share of the proceeds, arranged a meeting with Polish Intelligence in Warsaw.

Harper conducted a total of a dozen meetings with Polish agents in Warsaw, Vienna and various locations in Mexico betwen July 1979 and November 1981. He received approximately $250,000 for documents whose loss has been rated by Army experts as "beyond calculation."

Harper and Schuler were married in October 1980. She died in June 1983 from complications of cirrhosis of the liver.

James Harper was ultimately arrested in October 1983, partly on the basis of information from a source within the Polish Intelligence Service. But his apprehension was also partly due to his own futile efforts to negotiate immunity and and a double-agent role for himself through anonymous contacts with the CIA and the FBI. Shortly after his arrest numerous classified documents were recovered from a safe deposit box in his name in a bank in Tijuana, Mexico.

The case against Harper has now been completed with his sentencing and incarceration. But certain aspects of this investigation remain active. Some details have not yet been released, and of course some never will be.

This account is based primarily upon court papers pertaining to the prosecution of Harper, especially affidavits and testimony by the FBI investigators. We have also drawn upon a follow-on inspection of the cleared facility by the Defense Investigative Service.

The most detailed account of Harper's activities was provided by prosecution testimony at a pre-sentencing hearing on April 16, 1984. This hearing did not receive extensive coverage in the press, although more limited information available at the time of Harper's arrest last October was widely reported.

As additional information becomes available on the case, we will provide follow-up articles in future *Bulletin* issues.

HIGH STAKES HAGGLING

Accompanied by his friend Mr. Hugle, James Harper sat down on July 17, 1979 in Warsaw across the table from Zdzislaw Przychodzien, known publicly as an official of Polish Ministry of Machine Industry but in fact a lieutenant colonel in the Polish Intelligence Service and head of an intelligence section or "Wydzial" using the Ministry as cover for collection operations against the West. Przychodzien was fluent in English, having been assigned to the U.S. in the 1970's with the Polish Commercial Office in New York.

Page 533 of 3957

Harper described the materials now accessible to him through Louise Schuler at Systems Control, including classified documents pertaining to U.S. strategic forces and ballistic missile defenses. And he provided reproduced excerpts of ten documents. (Enroute to Warsaw he had placed copies of the full documents in a safe deposit box at the Citibank in Paris.)

Przychodzien was very interested in the material. He promised generous payment, although he demurred at the American's initial asking price of one million dollars. Also discussed at this July meeting were other materials available to Harper including computer database tapes obtainable through his contacts in Silicon Valley.

Harper and Hugle agreed to meet with Przychodzien again in Vienna the following October. On that occasion Harper delivered full copies of the ten documents which Przychodzien had previewed earlier. He also provided excerpts of additional documents.

But a disagreement arose, or rather erupted, over the matter of payment. Harper and Hugle had come down a good deal from their original demands, but they understood that $15,000 would be paid for one of the ten documents. When Przychodzien declined to pay that much Hugle started a shouting match which quickly broke up the get-together, which was taking place in a public lounge at the Hotel International.

Harper had travelled to Vienna with Louise Schuler. They left the city immediately following this incident and returned to California. Harper was naturally unsure of his position with Przychodzien.

It appeared that the Poles were not as interested in the classified Defense documents from SCI as he had originally thought, so he buried them, in an out-of-the-way location in the San Joaquin River delta near Stockton, California—just for safe-keeping in case a buyer could later be found.

SOGGY SECRETS AND GREETINGS FROM YURI

At this point Harper wanted nothing further to do with the excitable Mr. Hugle, but he was able to reestablish contact with Przychodzien through a friend in Switzerland, and he returned to Warsaw in May 1980 with the Silicon Valley database tapes and without any classified documents.

But it was the classified ballistic missile material that Przychodzien really wanted. The intelligence officer paid $10,000 for the ten documents delivered at the stormy meeting in Vienna, apologized for the misunderstanding and urged Harper to come back with all of the Defense documents he could get his hands on.

So Harper went back to the delta, dug up his "stash" and transported the additional documents to Warsaw (via Vienna and Geneva) the following month (June 1980). Harper later estimated that this second delivery of reports, some of which were classified, weighed about 100 pounds. The documents were somewhat the worse for their seven month interment on the banks of the San Joaquin River. But Przychodzien's people worked through the night of June 5 to separate the matted pages and restore the materials to decipherable condition.

Page 533 of 3957

On June 6 the documents were brought to the Soviet Embassy where a team of 20 KGB experts, flown in specially from Moscow, declared them to be genuine and extremely valuable. Harper was paid $100,000 on this occasion. A month later Przychodzien and his unit received a commendation for their efforts, directly from KGB Chairman Yuri Andropov.

JIMMO MEETS JACQUES

Harper next returned to Warsaw in September 1980, this time bringing along a document registered for the safe in his wife's office, i.e., an inventory of all documents in the SCI president's security container. The Poles selected several items for purchase and Harper delivered them during visits to Warsaw in October and November 1980, receiving $20,000 in payment.

During the November meeting with Przychodzien Harper was instructed to meet next time in Mexico City with a Polish agent whom he knew only as "Jacques." Harper himself was given the code name "Jimmo." He occasionally wore an "Irish Brotherhood" medallion, and this was to be used as a recognition device. In addition, Harper wrote a limerick on the back of the laundry slip. This was then torn in half, and Jimmo and Jacques were to confirm identities by matching the halves of the paper.

The first meeting with Jacques took place as agreed at the cashier cage of the Museum of Anthropology on December 14, 1980. Harper brought no documents, treating the occasion as a dry run to establish contact and "get the feel of the city." Jacques paid him $10,000 anyway, and at the next encounter in the same city two months later Harper brought nine Secret documents and received $60,000.

Following one more transaction with Jacques (eight classified documents and excerpts of 30 more, in return for $50,000), Harper told the agent in September 1981 that he was dissatisfied with the payments he was receiving. He brought no documents to the September meeting, in Guadalajara, and received no payment, although Jacques had brought along $30,000 for the 30 documents previewed last time in extract. It was agreed that Harper would go back to Warsaw to work out his complaints with Przychodzien directly.

This was in fact the end of Harper's active dealings with the Poles. He made a trip to Warsaw in November 1981 and spoke with Przychodzien, but he remained dissatisfied with the payments offered and no further contacts ensued.

Before going to Warsaw Harper had driven with Louise to Tijuana and placed his remaining collection of classified documents in a safe deposit box, where they remained until retrieved by the FBI, with Harper's cooperation, following his arrest.

These were actully the last documents available to Harper, since Louise lost her clearance in August 1981—not due to any suspicion of her activities but rather due to acquisition of her company by a foreign firm.

Under an arrangement approved by the Department of Defense, SCI's Defense contracts have been retained by a "spin-off" company insulated from the parent by a stock proxy agreement. The fa-

cility clearance for this subsidiary was later upgraded from Secret to Top Secret. But Ruby Schuler remained an employee for the original SCI organization, now under British ownership, and her Secret clearance was administratively terminated as a result.

She had major surgery in August 1982 and died the following June of cirrhosis of the liver. Her death certificate lists "alcoholism" as a "secondary cause" of death.

PLAYING BOTH ENDS

In September 1981, at the time he was becoming increasingly unhappy about his exchanges with the Poles, Harper contacted attorney William Dougherty requesting that Dougherty act as go-between in negotiations with the CIA and FBI. Harper wanted to arrange immunity from prosecution in exchange for information on his activities and services as a double agent. While concealing his identity from the lawyer, he provided detailed written and tape-recorded accounts of his espionage activities through Dougherty to the government. This continued for two years until Harper's ultimate arrest, although the government showed no willingness to agree to his terms.

Investigators succeeded in positively identifying him in March 1983. He was immediately placed under physical surveillance at his home in Mountain View, California, where he was at that time living with Louise. Wiretaps were also authorized and installed on their telephone.

Investigators were able to learn the location of a storage locker where Harper kept records of his activities. They also learned that he was planning overseas travel and was again in contact with the Swiss friend who had arranged earlier meetings with Przychodzien.

He was arrested on October 15, 1983, forestalling any chance that he would turn over his remaining documents.

THE KGB CONNECTION

One lesson of this case is unmistakable confirmation of the intimate ties between Warsaw Pact intelligence services and the Soviet KGB. It is clear not only that the Polish Intelligence Service works closely with the KGB, but that they in fact work for the KGB.

When Harper brought his main installment of documents to Warsaw in June 1980 the Poles spent the night putting the pages in order, but once collated the materials were immediately turned over to the Soviets for evaluation and analysis.

Harper has stated to the FBI that the tasking presented him by the Polish agents was derived from a "master shopping list" provided by the Soviets. And this has been confirmed by the Polish intelligence officer who served as a source in breaking the Harper case. U.S. investigators have not revealed the source's identity but they have testified that he was an officer of the Polish Intelligence Service at the time Harper was active, that he was a close colleague of Zdzislaw Przychodzien and that he served as liaison officer with the KGB for Przychodzien's intelligence unit. The source has confirmed that Polish agents respond directly to detailed tasking from the KGB, with military collection as a top priority.

Page 536 of 3957

The Polish source was aware of Harper's activities, although he did not know Harper's identity. Przychodzien had told him of the initial meetings with an American, fitting Harper's description, who had access to ballistic missile information.

He even recalled seeing a phone message from Hugle written on Przychodzien's desk calendar at the time of those first meetings in October 1979. This inside information confirmed the authenticity of Harper's accounts once his anonoymous statements began coming in.

SECURITY IN THE FACILITY

Information so far available does not reveal any major security deficiencies at SCI which can be identified as contributing directly to Harper's and Schuler's activities. She apparently removed the documents from the facility to be reproduced at home on a paper copier which Harper had bought for the purpose. As in most facilities, governmental or industrial, there were no searches at the exists to prevent removal of classified material.

Schuler was noted in the facility during evenings and weekends. On at least one occasion Harper was with her. But this was not a violation since he was escorted—by Schuler! Unexplained off-hours activity has often been highlighted as a possible indication of espionage, and this is another case in point.

As a result of the case the company has centralized its classified document storage at one location under direct control of the security officer (something which would obviously not be possible for a larger facility), and they have implemented tighter personnel access controls for non-working hours.

There are some indicators that certain adverse information regarding Louise Schuler was known to co-workers and company officials and was not reported. She was, first of all, an alcoholic and ultimately died of complications from that disorder. Quotations in the press indicate that co-workers were aware that she carried vodka in her purse and drank on the job. An inquiry into that issue might have revealed some indication of her illicit activities, or possibly exerted some deterrent effect.

In addition, a former employee of the company, also a cleared individual, had a close involvement with Louise during much of the period in question, and he was aware not only of her drinking but also of her unexplained income. She does not seem to have flaunted her ill-gotten gains in a public sort of way, and most co-workers would have had no occasion to notice anything out of the ordinary.

But this other employee was with her on at least one occasion when she placed a large stack of $100 bills in a safe deposit box at a local bank, and he did not report this.

THIS CRIME DIDN'T PAY

Much of what makes the Harper case an interesting story also makes it an atypical story, therefore limiting its value as a source of "lessons-learned" for future reference and edification. But it does bring to the public view a rare glimpse of the inner workings of a foreign intelligence service. And it emphasizes the clear and present danger which espionage poses to our national security.

Page 536 of 3957

The case dramatically demonstrates that our security system is inherently and perhaps inevitably vulnerable to betrayal from within. Procedures and physical barriers can keep uncleared people from direct access to classified material. But when a cleared person goes bad, our defenses have already been breached and some damage is bound to occur.

Above all, the case highlights yet again that our system rests ultimately upon the integrity of the cleared individual. We must strive to indentify and motivate that quality, however elusive.

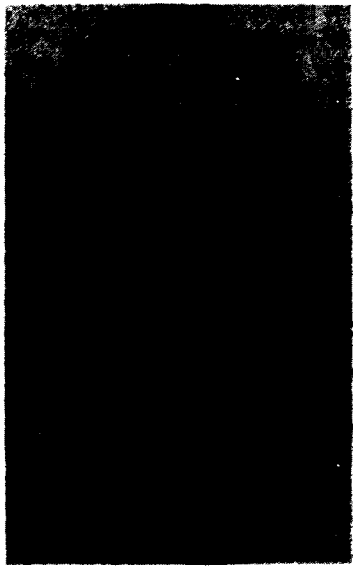
Finally, the sentence received by Harper provides a "lesson-learned" that is hard to overlook.

At the time of sentencing Judge Samuel Conti emphasized that he had "never heard the defendant say that he was sorry," and he called Harper's criminal activities "beyond comprehension or toleration." "Your actions have exposed all of our people to risk and danger," he said, "a danger that could well extend into the 21st century."

"There can be no crime more serious than that of selling our country's defense secrets to a foreign government," the Judge stated. "Your crime concerns each and every living and yet unborn citizen of this country," and it threatens "the very heart and existence of our freedom."

"It is ironic, indeed, that you pled guilty on April 15th, and that's the very day that all federal income taxes were due. It goes without saying that a great portion of the billions paid in taxes goes for national defense and yet you, for your own personal greed, would cause many of these billions to go for naught and to the advantage of a foreign power."

The judge then imposed the maximum sentence—life imprisonment, with recommendation against parole.



APPENDIX C

[From the Defense Security Institute Security Awareness Bulletin, June 1983]

CAUGHT UNAWARES: THE CASE OF WILLIAM BELL AND MARIAN ZACHARSKI

Marian Zacharski arrived in Los Angeles from Poland in late 1976. He was assigned as West Coast Branch Manager for the Polish American Machinery Company (POLAMCO), a U.S.-incorporated firm serving as marketing arm for the Polish trade agency, Metal Export.

But machinery was not Zacharski's only business. He was also covertly assigned by the Polish Intelligence Service to spot and recruit agents within California aerospace industry. And he was for a time highly successful in both his occupations. By early 1981 (at the age of 29) he had been appointed president of POLAMCO, and he had recruited at least one agent with access to important classified weapons information and technology.

Thereafter, Zacharski's fortunes took a turn for the worse, and by the end of 1981 he was serving a life sentence for espionage against the United States—but not before doing both a lot of good for Polish exports and a lot of harm to U.S. national security.

William Bell was Zacharski's agent. He was born in Seattle, Washington on May 14, 1920. He was employed an an engineer with Hughes Aircraft Company and met the Polish businessman in 1977 at the Cross Creek Apartments in Playa del Rey where both were residents. The two shared an interest in tennis as well as a common concern with the aerospace industry, where Zacharski sold much of his industrial equipment.

After almost a year of purely social and recreational contacts, Zacharski began to ask Bell for unclassified literature from work. Then he asked for "interesting" material and received first Confidential, then Secret documents to look over. He paid Bell lavishly for his minimal "consulting" work. And when Zacharski proposed that Bell, for additional thousands of dollars, photograph classified documents and carry them to Europe to meet other Polish representatives, Bell was ready to go along. Soon he felt "over his head" and too committed to back out. William Bell is now in prison, serving an eight-year sentence.

Zacharski's recruitment approach was a standard one. It should be as familiar and hence as ineffective as attempts to sell shares in the Brooklyn Bridge. But Bell's susceptibility was not the result of tender years, or slim experience or lack of education, training or intelligence. He was 57 years old when he meet Zacharski, with 25 years in Defense work, a B.S. in applied physics from UCLA and two overseas tours with his company.

Page 538 of 3957

Bell had been briefed on the threat of hostile intelligence services, but he did not recognize the classic approach when he encountered it in real life. He did not believe that it could actually be happening to him, that this amiable Polish tennis buff (who reminded him of his estranged older son) could possibly be anything other than what he appeared to be.

Bell was experienced, educated and informed—but not *aware*. We are using his story, as he has recommended that it be used, to enhance the awareness of others who may face a similar approach—and in the hope that they will respond by promptly reporting such contacts to security officials, for their own protection and for the protection of U.S. national security.

I. THE FACTS

Marian Zacharski was arrested for espionage in June 1981 and went to trial in October. He was convicted largely on the basis of William Bell's testimony against him, and Bell's lighter sentence was based in part upon consideration of his cooperation with the government in the final stages of the investigation and the trial. This account of the Bell/Zacharski espionage case is based primarily upon the transcript of Zacharski's trial. It also draws upon Bell's testimony in May 1982 before the Senate Permanent Subcommittee on Investigations.

Troubled times

In the Fall of 1977, when he was first introduced to Marian Zacharski at the swimming pool of the Cross Creek Apartments, William Bell had recently returned to Los Angeles from an assignment in Brussels as Manager of European Operations for the Radar Systems Group, Hughes International Corporation. He was now a Project Manager in the Advanced Systems Division, Radar Systems Group at the main Hughes facility in Los Angeles.

Bell held a Secret security clearance and was responsible, as he later testified, for "development and promotion of the radar fire control product line for tank vehicles." He had been with Hughes since graduation from UCLA in 1952, employed entirely at the Los Angeles facility except for two European assignments (in the mid-1960's and from 1974 to 1976).

In his Senate testimony Bell stated that these overseas assignments had been "financial nightmares" for him, "although they are touted as glamorous and lucrative." Upon his return in 1976, he recalled, he was "pursued by four separate IRS offices for back taxes on disallowed deductions primarily arising out of my overseas assignments." The year of 1976 was in fact a low point in Bell's life for a number of reasons. He was divorced from his wife after 29 years of marriage ("in an extended proceeding") and was faced with alimony payments of $200 per week. His accumulated debts forced him to file bankruptcy in July 1976. During the previous year, Bell's family had suffered a tragic loss when his 19-year-old son died in a camping accident in Mexico.

In addition to finanical hardship, divorce and personal tragedy, Bell also later recalled feeling "like an outsider" upon his return to the Los Angeles plant. "I returned from Europe to find a younger

group at Hughes and I [was] shunted off to a quiet back room." But regardless of any disappointment with his assignment, Bell was in fact given major responsibilities for development of advanced weapons systems—a fact which Marian Zacharski was quick to learn.

New beginnings

When he met Zacharski in 1977 Bell was attempting to make a new start. He had remarried ("to a young Belgian citizen," formerly his secretary overseas) and had taken up residence with her and her six-year old son at the Cross Creek Apartments. He was making a gradual financial recovery (although alimony, taxes and debts still put a strain on his $35,000 income). And he found comfort in the companionship of a close friend:

> Zacharski and his wife moved into the apartment complex and I began to play tennis [with him] on a daily basis. He slowly became my best friend. He was about the age of my oldest son who had been close to his mother and quite distant from me since our divorce.

Marian "made friends easily," Bell recalled. The two couples socialized frequently both by themselves and with an informal "little United Nations," a social group at the complex consisting of couples one or both of whom were foreign nationals. And the two men found common professional interests as well. Zacharski was a skilled and successful salesman of industrial equipment and the California aerospace industry was one of his principal sales targets. He naturally discussed the aerospace business with his tennis partner and, in about mid-1978, he asked Bell for help in making contacts at Hughes and other companies in the field.

Bell gave Zacharski's name to a purchasing manager at Hughes and also contacted people at Lockheed and Northrop. And for this Zacharski paid him approximately $5,000. At the trial, the cross-examining attorney wondered why Bell had not been suspicious of such generosity. He had been, he claimed, though evidently only temporarily. "To recieve four or five thousand dollars for doing pratically nothing made me very suspicious."

> Q: It also made you very glad, did it not, Mr. Bell?
> A: It sure did. I needed the money.

The conscientious consultant

Bell and Zacharski discussed the possibility that Bell might be permanently retained by POLAMCO as a "consulting engineer" and sales advisor, although the terms of the arrangement were left studiously indefinite ("I was working, in a way, and talked about working as a consultant for POLAMCO . . ."). Bell began, again around mid-1978, to provide printed material from the office, to help Zacharski keep abreast of sales opportunities. "It started out [with] simple things," Bell later told the Grand Jury, "like the Hughes News," the company newspaper.

Then came documents of more technical substance. He brought Zacharski copies of the Hughes "Vector," a technically-oriented publicity sheet on company programs. Zacharski had specifically requested these openly-published materials. But then Bell began to

volunteer materials in response to Zacharski's general expressions of interest. "I could tell from our conversations that they were things that he would like to see." "We would be talking about it at the tennis court—unclassified documents in the beginning."

During the summer of 1978 he provided Marian with several documents "related to items that were machined." These were unclassified, at least for the most part, but "there was possibly one confidential. . . . I'm not certain." Bell has never been sure of exactly when he first showed Zacharski a Confidential document—or just which or how many such documents he had compromised.

He may also have been uncertain in his grasp of security requirements for the handling of Confidential material, as indicated by this courtroom exchange between Bell and prosecutor Robert Brewer:

> Q: Would that [taking documents home] be a violation of . . . security policy?
>
> A: Not a confidential document no. You can bring confidential documents home. You cannot bring secret documents home.

CAWGS, LPIR and DPWS

The Secret documents which Bell compromised can be more reliably identified since the company maintained accountability records for them (not required by the *Industrial Security Manual* for Confidential). Bell determined that his first transfer of Secret material occured in October or November of 1978 when he lent Zacharski (at the tennis court) Copy No. 8 of the "Proposal for a Covert All-Weather Gun System, Executive Summary, Volume I." Bell was the author of this material. He wanted Zacharski to understand his role at Hughes and he wanted to impress him with his work. "I was proud of it," he said of the Executive Summary, "and I gave it to him." Later Bell turned over an unclassified document on the same subject and stamped it Secret "to make it look more important."

The Covert All-Weather Gun System ("CAWGS") was the primary development project under Bell's technical management at that time. It envisioned the application to tanks of the Low Probability of Intercept Radar ("LPIR") or "quiet radar." LPIR utilizes a disguised radar signal which is difficult for enemy targets to identify as radar; they are thus prevented from taking evasive action or using the radar signal for directing return fire. The CAWGS, subsequently redesignated the Dual Purpose Weapon System or "DPWS" (to be used against both aircraft and other tanks), was Bell's main responsibility throughout his relationship with Zacharski. It was, according to trial testimony, the principal program compromised by his espionage activities.

A Friend in Need

It was announced in mid-1978 that the Cross Creek Apartments would be converted to condominiums. Bell and his wife wanted to remain, but he was worried that he could not make the down payment required to purchase this unit. His friend Zacharski said he might be able to help. And in February 1979 he provided Bell with

$12,000 in two payments handed over in envelopes at the door of Bell's apartment. They were speedy and uncomplicated transactions, as Bell later testified: "Q: Did you say anything to him? A: 'Thanks.' "

He used the money for the condominium payment and for back taxes. He assumed that the money was from POLAMCO's "marketing" fund. And he credited Marian's good will with inspiring this generosity. "I thought we were good friends and I knew he would like me to stay in the apartment complex. I wanted the condominium and I accepted the money."

Foreign liaison

Bell still thought it was in connection with "consulting" activities when Zacharski suggested, in the Summer of 1979, that he travel to Europe to meet certain unidentified Polish representatives ("whom I thought would be POLAMCO people"). He was asked to photograph documents from work and bring the film with him to the meeting in Innsbruck, Austria. Marian had earlier given Bell a Canon movie camera, which turned out to have a frame-by-frame capability ideal for photographing documents. He provided a tripod and special film and instructed Bell in using the camera in his bedroom.

William Bell departed on the first of four overseas "missions" on November 26, 1979. Marian gave him about $2,500 for expenses, although Bell's wife was an airline flight attendant and his trans-Atlantic fare was $18. On the morning of November 30 he went to a pre-designated restaurant in Innsbruck and was met by a man who introduced himself as "Paul" and asked "are you a friend of Marian's?"—the agreed-upon recognition signal. The two left the restaurant and entered a car driven by another man (name not recalled) and drove to the outskirts of Innsbruck.

Bell handed over his film and the three men discussed Bell's work, the types of information he should attempt to collect and the need for secrecy and security. At one point Bell was shown a picture of his wife and son. "He [Paul] told me that I had a lovely family. Then he said that our security depended upon each other and that if anybody got out of line that he'd take care of them." The Poles did not dwell on the point, but Bell clearly perceived an "implied threat" in Paul's words. Before leaving Innsbruck, he received $7,000 and agreed to another meeting in the same city in May 1980.

Lost innocence

When he returned to Los Angeles, Bell received an additional list of desired collection targets from Zacharski. On this and other occasions he was surprised at Zacharski's highly specific knowledge of system designations and even particular document numbers.

> Q: And did you ever ask Mr. Zacharski where he obtained those numbers:
> A: Yes.
> Q: What did he say, if anything?
> A: He didn't answer me. He just smiled.

By now, at the end of 1979, Bell could no longer maintain the illusion that he was involved in a (more or less) innocent consulting arrangement with POLAMCO. It was clear, as he testified, that he was "conducting espionage" for "agents or officers of the Polish Intelligence Service." And Zacharski himself dropped any such pretense after that time. He made no more requests for assistance in promoting machine tools.

Bell took three more trips to Europe, meeting with one or both of the Polish operatives at Innsbruck in May 1980, at Linz (Austria) in October 1980 and at Geneva in April 1981. Prior to each meeting he photographed several documents with the movie camera in his apartment (when his wife was away). At the Innsbruck meetings he provided film of unclassified and Confidential documents. At Linz and Geneva he turned over copies of Secret material related to the DPWS and LPIR system. He continued to receive substantial payments, in bills and in gold, from both Zacharski and the handlers overseas.

Deja Vu

After Geneva, Bell's next meeting with the Poles was to be in Mexico City. He was uneasy about transacting his business there, he testified, in part because "Mexico City is where a spy was caught, I don't recall his name." The name, of course, was Daulton Lee, accomplice of TRW spy Christopher Boyce. But Bell was relieved of the necessity of following Lee's footsteps to Mexico. He was called to Hughes security on June 23, 1981 to be questioned by the FBI. At the trial Special Agent James Reid recalled the crucial point of the interrogation as follows:

> [REID]: I showed Mr. Bell a translation of a Polish newspaper article which indicated an individual who had been assigned to the U.N. In New York had defected to the United States Government. I then explained to Mr. Bell that this individual had in fact defected, and that he had been providing the FBI with information concerning activities of the Polish Intelligence Service in this country.
>
> Q: What if anything did Mr. Bell say?
>
> A: Mr. Bell asked, "Did he mention me?" And then without waiting for an answer, he said, "this is very serious. I would like to talk to an attorney."
>
> [Reid told Bell that he could talk with a government attorney or make a telephone call to an attorney of his own.]
>
> Q: And after you said that, what happened?
>
> A: Well, at that point Mr. Bell physically slumped in his chair and he said, "I did it. I do not need an attorney."

Bell signed a confession and agreed to cooperate in the further investigation of Zacharski. On June 28 he was fitted with a hidden recording device when he met with Marian on the apartment grounds to discuss further payments and certain sensitive programs at Hughes which Zacharski was interested in targeting. Zacharski was arrested shortly thereafter.

II. THE LESSONS

The Bell case, like any other espionage case, has its unique and peculiar elements. But it is, by and large, a "text-book" case which confirms many of the long-standing precepts of counterintelligence, as well as patterns derived from recent espionage cases.

Motive and predisposition

Financial gain was Bell's primary motivation. This is typical of most recent cases, and his testimony was quite clear on the point. Politics or ideology did not play a part:

> Q: You are not, in other words, a secret Polish patriot?
> A: No I am not.

The motivation was primarily mercenary. "Mr. Zacharski had found a fool that needed money. I had a weak spot. He took advantage of me." Bell also cited the veiled threats from "Paul." This played some part in his thinking and discouraged him from pulling out once he was involved, but "the motive was always money." ("Q: Was it worth it? A: No, absolutely not.")

Financial difficulties and other personal problems were an important cause of Bell's susceptibility to recruitment. From his trial testimony, it appears that Bell faced the kind of difficulties which everyone encounters at some time during life, although the coincidence of several misfortunes in quick succession clearly contributed to an imbalance in judgment. Withdrawal of clearances in cases like this would generally be both cruel and unuseful. But certainly whatever positive assistance or counselling an organization might provide to employees in trouble, combined with an active program of defensive security training, will help to ensure that a person like Bell is not so choice a target for a person like Zacharski.

Job dissatisfaction or some element of grudge against the company or the U.S government have figured as predisposing elements in several recent cases (Boyce, Kampiles, Edwin Moore, etc.). Bell's remarks display some signs of disgruntlement with Hughes. The European assignments were not as "glamous and lucrative" as they were "touted" to be; he felt like an "outsider" among the younger personnel at the Los Angeles plant—and so forth. But here again Bell's difficulties were of a rather ordinary sort, providing no obvious warning of an employee who was ready to take desperate measures.

Espionage indicators

Several attempts have been made in recent years to draw up a behavioral profile of the typical spy, to identify the patterns of activity which are characteristic of espionage in progress. A listing of such "warning signals" published recently by the U.S. Air Force Office of Special Investigations (AFOSI) is provided following this article (below, p. 122). Bell's is presumably one of the cases which underlies this analysis and his activities do in fact lend credence to several of the major espionage indicators. AFOSI calls these factors an "Ounce of Prevention" since early reporting of suspicious behavior may help to halt an espionage operation before irreparable damage is done.

Page 545 of 3957

Unexplained affluence is well known as a possible tip-off to ongoing espionage and certainly Bell received a substantial increase in income from his illicit activities. His estimates of the total amount varied wildely, from $70,000 to $170,000. Payments specifically cited during the trial were totalled to between $101,000 and $103,000.

Bell spent or invested most of the money, although some of the gold remained unconverted at the time of his arrest and was confiscated by the government. His testimony indicates that he was relatively conservative in his use of the funds, and even the luxury items cited—a "red Cadillac," a $2,000 necklace for his wife and a brief vacation to Rio de Janeiro—would not necessarily appear extravagant for a family with an income of $52,000 (in 1980): Bell, $40,000, his wife, $12,000). Much has been made in press coverage regarding the "young stewardess" angle in the case, but there is no indication that Bell's second wife either contributed to his financial setbacks or drove him to seek new income in support of an inflated lifestyle. (And she was not in fact an airline flight attendant when she met and married him but entered training in Janaury 1979.)

Bell's windfall earnings were directed not to high living but primarily to hastening his recovery from bankruptcy. His was a case not so much of unexplained affluence as of unexpected solvency. Any major alteration in financial circumstances may be of significance when personnel with access to classified information are involved.

Attempts to gain unauthorized access to classified information (e.g., beyond legitimate need to know) are often characteristic of diligent spies, but Bell seems to have avoided this pitfall. He was apparently a cautious (or lazy) agent and did not seek out information beyond his assigned projects. The major compromises confirmed at the trial (LPIR, DPWS) fall within the scope of his primary duties as a project manager.

Removal of classified material from the facility is a more or less inevitable accompaniment to spying, and certainly Bell took some risk in this regard. When he carried documents home to be photographed he was vulnerable to detection since Hughes had a policy of random searches at the plant exits. Either Bell was lucky in his timing or he was somehow able to anticipate the searches. In any case he was never caught in the act.

Foreign travel, on a regular basis and without sufficient explanation, is another "tell-tale sign" displayed by Bell and one which evidently contributed to his detection. His trips to Europe were partially legitimized by company business and family visits. But testimony (Bell himself and by a Hughes security official) indicates that his overseas travel—and, on one occasion, incomplete reporting of his itinerary—was a factor which helped to place him under suspicion.

Awareness: The best prevention

So Bell confirms, to some degree, certain of the behavioral patterns associated with previous cases of this kind. Financial difficulties and job-related dissatisfaction can predispose an individual to espionage. Unexplained income, unauthorized removal of documents and unexplained foreign travel may be indicators that espio-

Page 545 of 3957

nage activity is underway. But the case also confirms the difficulty of applying this sort of preventive counterintelligence to real-world situations, without the benefit of "20/20"hindsight." The real "ounce of prevention" would have involved measures to forestall Bell's recruitment in the first place. And there is good reason to think that this could have been done—with the infusion of a little more awareness.

"Who Would Expect it . . ."

This presupposes that Bell was genuinely unaware, during the initial stages, of what Zacharski was up to. A more cynical view might suppose that he knew exactly what was happening all along and complied with Zacharski's wishes, from the beginning, with his eyes wide open. But those who investigated and prosecuted Bell are inclined to accept his account of the evolution of the case. And Bell has testified that, when he returned to the state-side facility from Brussels, he assumed that his worries were over where hostile intelligence activities were concerned. "When you are sent to Europe," he told the Senate Subcommittee, "you are told to expect attempts by foreign spies, but whoever would expect it to happen here at home?

He received the required briefings and signed the required forms upon rejoining the Los Angeles organization, but apparently treated them as a matter of insignificant routine. A "Security Briefing and Termination Statement" was introduced in evidence at the trial, and he acknowledge having seen it: "I recall signing the normal form you sign when you hire into the company. . . . There are many forms you sign and I am sure that was one of them."

"Whoever would expect it to happen here at home?" It was in this innocent frame of mind that Bell initially made the acquaintance of the Polish machinery salesman and then agreed (in fact eagerly sought) to serve as a consultant for POLAMCO, an arrangement which included providing inside information on his company. The delusion persisted right up to his first overseas visit:

> Even as I went to Innsbruck, Austria, I was rationalizing and kidding myself that the persons I would meet were representatives of POLAMCO, that this was just the kind of industrial espionage that goes on all the time.

After his return from Innsbruck, Bell knew exactly what he was doing and exactly what had been done to him. Why he did not extricate himself at that point is a complex psychological question involving a confluence of material inducements, Zacharski's personal magnetism and "Paul's" implicit menace. For whatever reason, Bell now felt genuinely trapped. He told the Senators after his conviction: "There is little left of my life now but I feel I am freer in prison than I was with Zacharski."

The classic modus operandi

Clearly there was more to this entrapment than simple monetary temptation. And we must not take too literally Bell's own statement that he was "a fool that needed money." A fool he may have been and he was certainly hungry for cash. But too much

stress on Bell's foolishness can lead us to ignore Zacharski's skill. Preoccupation with financial motives, moreover, can obscure the fact that many months of cultivation *preceded* the first mention of money between Zacharski and Bell. We must not ignore the subtle but powerful psychological influences which reinforced the material incentives once offered and laid the groundwork for Bell's receptivity, by creating a willingness to regard Zacharski's offers as well-intentioned, as motivated by friendship and a good will.

Cover

Bell's recruitment was the result (not necessarily the only result) of a carefully planned and orchestrated intelligence operation. As the focal point for this operation, Zacharski was provided with the best possible cover for his activities, a cloak of propriety calculated to inspire the least possible suspicion. To begin with, his nationality was in his favor. As a citizen of an Eastern European country he would not present the same threatening image as a Soviet national—although there can be no doubt that the information he collected was to be shared with Poland's Warsaw Pact ally. (It might be recalled in this connection that during the year Zacharski arrived, 1976, a Presidential candidate had come very close to declaring Poland a member of the free world!)

In addition he was provided with a commercial rather than a diplomatic position. He was employed, in effect, by the Polish government, but as a salesman of industrial equipment he assumed an image which was less official and hence, again, less threatening. In addition, he was exempt from travel restrictions imposed upon diplomats from communist countries and had more flexibility of movement and greater access to U.S. industrial facilities and personnel. Of course commercial status carried with it a certain disadvantage: no diplomatic immunity. Zacharski is no doubt now hoping to be exchanged for someone imprisoned in the Soviet bloc, but there have been no indications that a swap is contemplated.

Once fitted with suitable camouflage, Zacharski was introduced into a promising hunting ground, the technology-rich area of Los Angeles, California. He moved into an apartment complex where many executives and engineers of aerospace companies were residents. And he set to work.

Closing in

Having met William Bell, as he must have met many others in similar professional positions, and having decided to proceed with cultivation, Zacharski worked with extreme caution and practiced subtlety. He was a skilled salesman and master persuader and well equipped for his task.

Bell testified that they first met in Autumn 1977. He could recall no requests of any kind from Zacharski until mid-1978. So Zacharski spent the better part of an entire year simply making friends with his prospect, insinuating himself into his personal life, meeting and befriending his family, assessing his character traits (and flaws), learning his likes and dislikes (and sharing them), discerning his weaknesses and above all his needs.

Only after many months of this did he *begin* seeking active assistance from Bell and overtly feeding his desire for money. Corne-

lius G. Sullivan, a former counterintelligence agent with the FBI, testified at the trial that this is a crucial "dividing line" in the process of developing an agent, the boundary between a simple social relationship and one involving overt exchange. This "barrier" is typically overcome, he said, by first requesting unclassified and seemingly innocent items—and this of course is the approach which Zacharski adopted.

There is also a second dividing line—between providing innocent, public materials and handing over restricted, sensitive and/or classified items. Zacharski used the "consulting" process to bridge the barrier between legal and illicit activities, and this was perhaps the central gambit in his very successful strategy. It was so effective in fact that Bell apparently volunteered the first transfers of classified material on his own initiative.

The "Pitch"

Offering the prospect of a consulting arrangement, as a prelude to espionage, proved successful in this case for a number of reasons. The promise of additional income appealed to Bell's financial hunger, of course. And it must also have appealed to his entirely normal professional vanity to be asked to lend his technical expertise and the benefit of his contacts in the industry. Because the arrangement was obviously improper to a degree, it introduced a surreptitious element into the Zacharski/Bell relationship and helped to ease Bell toward a fully clandestine role as a full-fledged spy. (Bell explained his additional income to his wife as coming from work for a Swiss aircraft firm. He asked her to be discreet about the arrangement, stating that Hughes would not approve of his consulting for a competitive firm.)

Perhaps above all the consulting arrangement permitted Zacharski to deceive Bell, and Bell to deceive himself, into regarding the initial compromises of national security information as a venial sort of "industrial espionage." "Within the avionics industry," Bell told the Senate Subcommittee, "it is a common practice for all companies to obtain the secrets of their competitors by the same techniques Zacharski used with me." He thought of POLAMCO as "an American company." They had offered him a job which would be "the solution to all my problems." And providing them with inside information from Hughes would only be adhering to the common practices of the industry, as he interpreted them:

> An engineer for one company is interviewed by the management of another. Considerable benefits are dangled in front of the engineer in terms of increased earnings and better position. He is asked to produce samples of his work and this is normally done without regard to security classification. . . .

Whether or not Bell accurately describes a common practice, he certainly does reflect a common attitude—"Everybody's Doing It." Zacharski exploited this attitude and used the consulting ploy to ease Bell almost imperceptibly into his intitial ventures in the illegal exchange of information. After that Bell felt that it was too late to back out, and it was indeed too late to prevent some damage to the national security, since some damage had already been done.

Thinking about espionage

"It would have been so much easier to warn me." This statement during Bell's Senate remarks does not excuse his crime—and it was not offered as exculpatory—but it may be the central lesson-learned in the case. Either he was not sufficiently warned, or he did not heed the warnings he received. Whether the blame is laid upon the system of security education or upon the individual, the damage to national security is the same. And better awareness training—drawing upon Bell's case as a cautionary example—should help to warn others similarly situated. As Bell himself put it: "Every person employed in a security job should know what I did to myself, to my loved ones and to my country and [should] realize how easy it is to get trapped."

In an article published on the anniversary of the trial, the Los Angeles *Daily News* stated the lesson of the Bell case very aptly: "When William Holden Bell worked for Hughes Corporation, he never seriously thought about espionage. But it happened anyway." Thinking seriously about espionage, about the reality of espionage, is the first requirement of security awareness. And security awareness is the key to security compliance.

III. THE BOTTOM LINE

Based upon the lesson of Bell/Zacharski, and other similar cases, awareness briefings should stress the following:

What you should know

There is potential danger in any sustained contact with a communist-country national (and not just with Soviets). You are not required to avoid all contact; just be careful.

Recruitment is a subtle, gradual process (a "long, bit-by-bit thing," Bell called it). Cultivation may last for months or years and initial active involvement may have nothing to do with espionage in any recognizable form.

Recruitment may involve no elements of blackmail or threat, so those who regard themselves as "clean-living" may nonetheless be susceptible to this sort of activity.

Positive inducements are generally more effective than threats. And such inducements will involve psychological ploys (friendship, flattery, sharing of common opinions/interests) as well as (and usually prior to) material offerings.

"Entrapment" once it comes is as much a psychological as a material entanglement, and commitment (as in Bell's case) may only be recognized after the fact.

What you should do

As a cleared contractor employee, you *must* report to the security supervisor: 1) all acts of espionage or suspected espionage, 2) any attempt to gain unauthorized access to classified information, 3) any compromise or suspected compromise of classified information, 4) plans for travel to (or through) a communist-controlled country, 5) plans to attend any professional meeting where communist-country nationals may be in attendance, 6) plans to host a facility visit by communist country nationals.

You should (for your own protection) report any contact, particularly sustained contact, with a communist-country national, even if purely personal and seemingly casual. In this way you avoid any suspicions which might arise regarding your own conduct and permit authorities to warn you if the individual is suspected of intelligence involvement.

POSSIBLE ESPIONAGE INDICATORS: "AN OUNCE OF PREVENTION"

(Source: U.S. Air Force Office of Special Investigations (AFOSI)
(Adapted from TIG Brief 18, 1982))

From an analysis of confirmed espionage cases, AFOSI has developed a listing of characteristics shared by several of the spies in varying degrees. *While no element of this list of "warning-signs" is, in itself, proof of an individual's involvement in espionage,* observation of such characteristics in the behavior of an individual with access to classified information should be a matter of concern to security and supervisory personnel. Even where espionage is not present, several of the characteristics may be indicative of problems in suitability or security which cannot be prudently ignored.

The list as presented here has been adapted to reflect the special requirements applicable to Defense contractors under the *Industrial Security Manual for Safeguarding Classified Information (ISM,* DoD 5220.22-M), as well as requirements for DIS employees.

Behavior patterns of possible significance include the following.

Attempts to expand access to classified information, through repeated volunteering for special assignments with additional access or inquiries concerning information for which the individual has no need to know.

Unauthorized removal of classified material from the work area, by making extra carbons or copies or placing of classified materials in briefcase, purses, gym bags, etc.

Repeated or unusual overtime, especially unaccompanied, whereby the individual arranges to be alone or unobserved in an office containing classified material.

Falsifying destruction records by requesting certification or witnessing signatures for destruction of classified materials which the individual has not actually seen destroyed.

Sudden, unexplained affluence as indicated by purchase of expensive cars, real estate, jewelry, etc.; by display of large amounts of cash; or by lump-sum repayments of significant debts, large stock purchases, or opening of substantial savings accounts—in the absence of some legitimate source of increased income. Unexplained affluence is of particular concern when it follows a period of leave or travel.

A pattern of recurring travel, within the United States or (especially) abroad, perhaps 2 to 4 times per year, without apparent recreational or business purpose. Married individuals who travel for tourism or recreation unaccompanied by family members may also be of concern.

Falsification of locations visited on leave statements or trip reports. Also reluctance to describe or ignorance concerning places supposedly visited.

Page 551 of 3957

Travel to Communist countries or on communist-flag ships or aircraft not involving an organized tour and not explained by business or family connections. Any attempts to visit communist countries without complying with applicable reporting requirements is of particular concern (e.g., paras. 5u and 6b[9], *ISM*).

Repeated association with Communist-country nationals without *bona fide* business purpose or without required reporting.

Note for contractors

Under the *ISM* cleared contractor employees must report anticipated contacts with communist-country nationals at professional meetings or through facility visits (para. 5u). A forthcoming change to the *ISM* (new para. 5ah, to be published in "Industrial Security Letter" no. 83L–1 and the next edition of the *ISM*) will require contractor employees to report "all questionable or suspicious contacts with nationals or representatives of communist countries," i.e., any contact "determined to consist of an actual, probable or possible hostile intelligence collection effort." Paragraph B, Appendix VII, is referenced for assistance in recognizing reportable contacts. (Para. 6c will be revised to require relaying of such reports from Security Supervisors to DIS and the FBI.)

Note of DIS employees

DIS employees, as well as all Federal employees, are required to report improper or suspicious contacts by representatives of any foreign interest, just as contractors are required to report. These naturally include contacts by communist-country nationals. See DIS Regulation 25–5.

While none of the indicators listed is proof of espionage, any pattern of conduct on the part of a cleared employee which suggests the possibility of improper activity should be reported by supervisors or managers to the Facility Security Supervisor (under para. 5af of the *ISM*). Security Supervisors should report in turn to the Defense Investigative Service and the FBI, as called for under paras. 6a(1), 6b(1) and 6c.

Where there is doubt whether information should be reported, it should be furnished to the proper authorities for evaluation. Security Supervisors should be aware that in two 1967 cases the U.S. Court of Appeals for the 4th Circuit held that a contractor is not liable for defamation of an employee because of reports made to the U.S. Government pursuant to the *Industrial Security Manual* (*Becker vs. Philco* and *Taglia vs. Philco,* 389 US 979). The Court stated in essence that such reports are privileged, since the contractor in executing the requirements of the *Manual* dons the cloak of a federal official.

Such reports do not of course constitute incrimination in themselves, and adverse action by government activities can only be taken with probable cause and due process. But the effectiveness of U.S. security and counterintelligence efforts is directly and vitally dependent upon early reporting of any possible instances of compromise or espionage.

Page 551 of 3957

APPENDIX D

[From the Defense Security Institute Security Awareness Bulletin, December 1985]

PORTRAIT OF AN UNEASY SPY—CAVANAGH CASE HIGHLIGHTS THE VALUE OF GOOD SECURITY

Thomas Cavanagh had secrets to sell. And he made no bones about his motive. "I'm after big mony," he told the prospective buyers. "Before our relationship ends, I want to be independently wealthy."

He knew that espionage was a serious crime and knew about several people who had recently been arrested and gone to jail. But in order to clear up mounting debts, and make himself rich, the Northrop engineer was willing to take some chances.

"They're real security conscious [at Northrop] and all that crap," he remarked during one meeting at the Cockatoo Motel near Los Angeles. Cavanagh thought he knew how to get around the document controls and random searches at the plant, but he was still very worried about being caught.

What he didn't know was that he had already been caught. The "KGB agents" he was meeting with at the Cockatoo and the Lucky Lodge in Commerce, California were actually FBI undercover agents.

In December 1984, after three meetings monitored and recorded by the Bureau, Cavanagh was arrested and charged with espionage.

In May 1985 he was sent to prison for life.

The Thomas Cavanagh case has some comic sidelights, but also some serious lessons for counterintelligence and industrial security. For the most part it's a success story, both for the FBI, which caught him before he could get to the Soviets and for the security program which put some real curbs on his ability to damage the nation.

Some of the lessons are plain. Above all, the case points up the importance of document accountability and reproduction control. And it suggests that exit searches can be an effective deterrent to espionage activity.

In the first part of the article we'll set the scene and tell the story of Cavanagh's encounters with FBI undercover agents, who posed as KGB officers speaking Russian and broken English. We'll listen in on their conversations as Cavanagh discusses what he's up against at the Northrop plant and how physical security and document control are cramping his style as a spy.

Less straight-forward, as always, are the implications for personnel security: adverse information reporting and the psychological "profile" of the espionage offender. Follow-up investigation concluded that Cavanagh's supervisors had not neglected their reporting responsibilities and that the reporting program at his facility

Page 552 of 3957

Page 553 of 3957

was satisfactory—although there were some hints in his behavior that might seem obvious in hindsight.

There's no question about Cavanagh's main motivation. He wanted money, first to clear up current debts, then to make himself "independently wealthy." But his conversations with the undercover agents also hint at other contributing motivations—job dissatisfaction, disgruntlement with management, social and/or political resentments.

Investigation by the FBI and Defense Investigative Service after the arrest revealed further details about Cavanagh's background and personality—for instance, a fraudulent salary claim when he first came to work at Northrop and a pattern of impatience and indifference regarding rules and procedures.

In the second half of the article we'll look into Cavanagh's background, as revealed through these interviews with former managers, supervisors and coworkers. And perhaps glean some insights into what brought him to the Cockatoo Motel on that day in December, with a classified document stuffed inside his shirt.

SOME ASPECTS OF THE CAVANAGH CASE REMAIN CLASSIFIED

We can't discuss how he was originally detected and became involved in meetings with the undercover agents, since that would compromise important investigative methods. But it's significant to note—for the benefit of other would-be spies—that someone attempting to contact the KGB can end up in touch with the FBI instead.

And we can't discuss the information which Cavanagh was trying to sell. He didn't succeed in selling it, and obviously we don't want to give any of it away for free.

Suffice it to say that he was working on a classified project requiring Special Access, and he'd been put in for Top Secret clearance requiring a Background Investigation. He told the "KGB" that a substantial down payment on his information would insure that excessive indebtedness did not interfere with the clearance upgrade leading to even more sensitive access.

At the first meeting, on December 10, 1984, Cavanagh introduced himself to his contacts as Mr. "Peters."

Two topics dominated his conversation: his financial problems and worries about getting caught.

He said early in the first meeting: "I'm up for a Top Secret clearance rating but I won't get that clearance rating because of my bill problems.

"So somehow we have to come to an agreement, ah, on money." He needed several thousand dollars, he said, "just to get the bill collectors off my back."

"Peters" was worried about being caught partly because of the recent espionage cases which he had heard about. He mentioned Bell, Boyce and "the two people in Sunnyvale" (the Harpers).

He was worred about leaks "on your end," i.e., U.S. informants inside Soviet intelligence, no doubt thinking of the informants inside Polish intelligence who helped put Bell and Harper behind bars.

See appendix C on Bell and appendix B on Harper.

Page 553 of 3957

Page 554 of 3957

And he didn't want to talk with his contacts on the telephone—"because it's constantly being bugged; they bug it with microwaves."

But his biggest source of anxiety was the security program at Northrop.

He was extremely concerned about his accountability for documents. He wouldn't turn them over to the "KGB" agents, and he wanted to get them back to the plant as quickly as possible.

"I can't give you the documents and have them back in time. They have audits. A guy just came by today and asked me how many secret documents I have." Security might open his safe and check his documents at any time.

By sheer coincidence, Cavanagh had faced a surprise audit of his classified documents on the very day of this first meeting with what he thought was the KGB.

It was strictly a random check by a company security representative—who had no suspicion that the material he was reviewing was about to be put up for sale to the Soviets. Everything was in order, but Cavanagh had been visibly upset, according to coworkers interviewed after the arrest.

"What are you messsing around with me for? I've served my time in Vietnam," he told the security officer. Cavanagh obviously thought twice about what he was doing—although he went ahead and did it. But the system of strict accountability put some important limits on his espionage activities.

Cavanagh was also hampered by reproduction controls at Northrop. "You can't run you own copies in the plant. They got that regulated too." The agents had to bring in a camera and a portable copier and make copies in the motel room.

Northrop employees were subject to random search of anything handcarried in or out of the plant. And Cavanagh was worried about that as well. "I had to stick it in my shirt and walk out with it."

He couldn't always fit things under his shirt. But he thought he could get through the exit searches without detection. The searches, he believed, were sufficiently infrequent and predictable to be successfully avoided.

Tougher and tougher and tougher

When he arrived for a second meeting on December 12, Cavanagh was greeted warmly by his friends at the motel:

> "KGB": "So, how are you today?"
>
> CAVANAGH: "Good. But a little nervous because, ah, getting the documents out is getting tougher and tougher and tougher."
>
> "KGB": "Why tougher?"
>
> CAV.: "They're real security conscious, and all that crap. Okay?"
>
> "KGB": "So you were scared?"
>
> CAV.: "Well not scared, just very careful and apprehensive. . . . Every once in a while you get somebody that's real conscientious and wants to look at everything going in and out."

Page 554 of 3957

So the "triple threat" of document accountability, reproduction controls and random searches made Cavanagh a very nervous spy—very "careful and apprehensive," as he put it. (And an "apprehensive" spy is a certain sign of good security, although in this case it fell short of total deterrence.)

Cavanagh was unable to obtain documents without signing for them (though he tried to do so, as we will see).

Making "bootleg" copies was impossible. Northrop Advanced Systems Division controls document reproduction through a system of "fully-controlled machines." In other words, no self-service. Special operators handle all copying machines, under the oversight of security. They make sure that all requirements are met for authorization, marking and accountability.

Cavanagh was also worried about the entrance and exist searches. But he felt that they presented an acceptable risk.

He didn't get the chance to test this assumption over the long run. There's no way of knowing if he could have gotten past the guards throughout the "long-term relationship" which he hoped to establish with the KGB. But he, and perhaps others, had the *perception* that the search system could be beaten. It was a threat, but not enough of a threat.

"It's cash and carry

During the second meeting (December 12) Cavanagh pressed anxiously for quick payment. "It's cash and carry cause I'm in debt up to my ears. I'm after big money."

He wanted the several thousand dollars in two days, but the "Russians" wouldn't make any promises.

> CAVANAGH: "Is it, is it possible to see money by Friday [Dec. 14].
> "KGB": "By Friday, I don't know. By Christmas. . . ."
> CAV.: "Oh God."
> "KGB": "Oh, you have very, how you say Merry Christmas. If documents are good."
> CAV.: "To be honest with you gentlemen, I need it before the 25th for security reasons [the Background Investigation]. I need that money."
> "KGB": "Okay, we do our best."

They met again on December 18. Right away, Cavanagh asked about the money. The agents had the money. And an arrest warrant.

> "KGB": "So, ah, how do you do today? Good to see you."
> CAVANAGH: "Okay, okay. Any word on the cash?"
> "KGB": "Oh we got good surprise for you today."
> CAV.: "Okay, okay. Am I gonna get it today?"
> "KGB": "Da da, yes."

Cavanagh showed them the documents he had brought along, and they struggled to make the portable copier function properly. He spoke of his financial bind. He was bitter that he couldn't get a business loan for his AMWAY distributionship, while Vietnamese immigrants, he felt, easily got money for fishing operations.

Page 556 of 3957

The agents suggested that future meetings be held outside the United States. But Cavanagh didn't want to keep his documents out that long. Besides, unexplained foreign travel might "flag" his activities with security.

Cavanagh was a gun collector and showed the agents a .45 caliber pistol he was carrying, because he was "nervous." Earlier he had warned the "Soviets" against carrying firearms ("No guns, no guns, all right, no guns.") They discussed guns and hunting. One agent took the gun to admire it, and then quietly held on to it.

A long-term relationship

After copying the documents, the agents handed Cavanagh the payment in small bills. He counted it eagerly. He wanted to have monthly meetings, he said, with substantial payment each time.

It should be worth it to them, "because billions of dollars worth of research went into those drawings. Billions!" Of course he didn't want to be "too greedy." "You know, if we play it right, it's a long-term relationship."

Cavanagh complained that bill collectors were calling him at work. "It's demeaning, degrading, cause everybody knows your business, you know?" "Of course, must be problem," one agent sympathized.

Cavanagh added: "I'm bitter because I worked hard for the company and sometimes politics plays a big role in getting ahead."

As they finished their business Cavanagh heard a noise outside. "It must be the maid, or perhaps the pipes," one agent said. "It wouldn't be bad just to look out the door," said "Peters." The agent looked out. "It is nothing."

But then a knock. The door was opened again. "FBI! Freeze, don't move!"

Cavanagh was arrested and charged with two counts of espionage. He was sentenced, on May 23, 1985, to two concurrent life terms in prison.

Postmortem

Espionage which threatens U.S. national security is never cause for celebration. But this case is, at least relatively, a success story. The F.B.I. caught Cavanagh before he reached the Soviets. And Northrop security did its job in curbing the range of his activities, through document accountability and control—and effective enforcement of need-to-know.

Particularly notable is the taming of the "Xerox" machine. Ready access to photo reproduction is popularly thought to have made document control obsolete.

But the copiers at Northrop were effectively controlled, so Cavanagh was forced to use original documents which were under accountability. This exposed him to detection through random audits, and it limited both the number of documents he could compromise and the length of time he was willing to keep them outside the plant.

Page 556 of 3957

Page 557 of 3957

Greed and indebtedness were the major motivations for Cavanagh. But there were other, more subtle, influences at work as well.

After the arrest, Cavanagh's activities, behavior and background were naturally probed in detail by both the FBI and Defense Investigative Service. We've already looked at Cavanagh's brief and very unsuccessful career as a spy.

What follows is the story of his career as a technician and engineer, with the U.S. Navy and three of the country's biggest aerospace companies. That career wasn't as successful as Cavanagh apparently thought it should have been.

Disappointment with his advancement both professionally and financially seems to have played a major role in the psychological lead-in to espionage.

Prologue

At the time of his arrest in late 1984, Cavanagh, 40 years old, was earning about $40,000 as an Engineer Specialist with the Advanced Systems Division of Northrop Corporation, Pico Rivera, California. He had begun his technical career as an Interior Communications specialist for four years in the Navy, leaving the service in 1967 as a Petty Officer Third Class. Between 1967 and 1978 he attended Cerritos Junior College, ultimately earning an Associate Degree.

He was married and had two sons, born in 1967 and 1968.

Rockwell and Hughes

He worked for North American Rockwell for about a year (July '68 to August '69) and then went to work for Hughes Aircraft Company, El Segundo, California. While at Hughes, Cavanagh was promoted from technician to "Research Associate." But he was unable to attain full status as an engineer without a four-year degree.

Records and recollections at Hughes didn't reflect anything particularly distinguished or out of the ordinary about Cavanagh. One supervisor recalled him as high-strung and temperamental but generally manageable. Another had found him likeable and easy to get along with.

But a third former boss said Cavanagh had problems dealing with people and recalled a heated argument in which he seemed on the verge of physical violence.

Cavanagh had once been formally counselled for tardiness and had been placed on a one-year probation for parking violations. His salary had been attached on three occasions, for debts of $125 or less.

He was very "money motivated," said one coworker. And he had a high opinion of his own skills and abilities. But he was unlikely to advance very far at Hughes, even apart from the lack of an engineering degree. Most coworkers assessed his professional abilities as fair-to-middling at best. His technical skills were "reasonably good," according to one supervisor. Another, more typically, rated him as a marginal electronics technician and better suited to mechanical assembly.

Cavanagh held a Secret clearance while working at Hughes.

Page 557 of 3957

Page 558 of 3957

Northrop: He hoodwinked us

In November 1981, Cavanagh made the jump to full engineer status when he joined Northrop Electronics Division in Hawthorne, Califorinia. Northrop gave him a substantial raise and the title of "Senior Engineer," on the basis of over ten year's experience as an electronics technician—and also due to Cavanagh's ability to sell himself despite a marginal record at Hughes.

But the size of the raise which Northrop gave him was based upon an inflated claim of final base pay at Hughes. Several co-workers at his former office were aware that he had presented Northrop with a pay slip reflecting substantial unitemized overtime, claiming the total amount as base salary for the pay period. Northrop Personnel Office accepted the claim, although one of Cavanagh's managers was pretty sure that he had "hood-winked us."

Cavanagh's Secret clearance was transferred from Hughes and he was assigned to work on automatic test equipment for the F-5 aircraft. At Northrop, Cavanagh generally held supervisory positions, even though here again his technical abilities were generally rated as marginal.

He had a "dynamic"—sometimes "brash"—personality, according to one coworker. His assertiveness evidently commended him to management as a potential leader, but it also led to some interpersonal problems on the job.

On his first assignment, supervising integration of test equipment for the F-5 project, Cavanagh's managers rated his engineering skills below par. One supervisor later recalled that he seemed better suited to a technician's role. He was "in over his head technically," said one coworker, but he had a "big ego" and "radiated confidence" in his own abilities.

Colleagues remembered him as a frequent complainer with a short temper. A couple of incidents had led to threatening remarks ("I'll knock her block off," and the like). Once he slammed a door into the back of a supervisor who was leaving the room after a heated exchange.

New assignment

In mid-1982 the F-5 project closed down and Cavanagh was given a less technically demanding assignment. One manager recalled that he took the downgrade in stride (there was no cut in pay), but he showed little enthusiasm for the new project. He was more "paper oriented" than the assignment required and "didn't like to get his hands dirty."

Part of his job involved computer maintenance, but he frequently called in the manufacturer's technician without really trying to fix a problem himself. Cavanagh viewed himself as a supervisor, one manager remarked, when the job really called for a "doer."

Managers and co-workers had seen no signs of major financial difficulties while Cavanagh worked in the Electronics Division. He wore good clothes and had a gun collection and two Corvettes (mid-70's vintage)—but nothing really out of line for someone making in the neighborhood of $40,000 per year. He asked for an early paycheck on a couple of occasions. During 1982 he took about $1000 as an advance on a trip to Beaverton, Oregon for a technical training

Page 558 of 3957

Page 559 of 3957

course. He apparently had trouble repaying what was due when he returned and was contacted several times by the finance office. He sometimes complained casually about owing money to unspecified creditors. But, in all, his co-workers had no reason to suspect substantial problems.

Cavanagh was separated from his wife at about this time (1982). He had no really close friends at Northrop and co-workers were unsure about the exact timing and details of his marital difficulties. But it was generally known that he had begun an affair with another woman during the trip to Oregon. After he moved out of the family house, the Beaverton woman came down to California to live with him in an apartment.

In January of 1984 Cavanagh was transferred on loan with several other engineers to an urgent and sensitive project in Northrop's Advanced Systems Division (ASD) in Pico Rivera. Cavanagh was one of the first to be chosen to go, according to one manager. Supervisors had agreed that he was more troublesome personally than he was worth technically.

Last stop

And again at ASD he ran into personal difficulties and soon had a reputation as a "chronic complainer." He had at least one heated exchange with his first supervisor, and co-workers recalled other "loud and nasty" remarks. He frequently objected that others were receiving promotions and raises while he was getting less than his due.

A subsequent supervisor at ASD recalled that Cavanagh was careless and impatient with controls and procedures and had an inflated view of his own capabilities. But this manger thought Cavanagh might respond to additional responsibility, so he placed him once again in a supervisory position, as a lead engineer—his final assignment prior to the arrest in December 1984.

ASD management personnel interviewed after the arrest suggested that Cavanagh had some problems with administration and working with others but was improving in those areas. Again his engineering skills were called into question, but he seemed to be meeting basic expectations.

In this last assignment Cavanagh seemed to be generally well-liked by co-workers and subordinates. He regularly bowled and played softball with groups from the office.

One engineer who worked for him said that Cavanagh was the "clown" of their group. Everyone had laughed when, shortly before his arrest, he asked if he could deposit $10,000 in a bank without alerting the IRS.

Financial brinksmanship

Co-workers at ASD had a general idea that Cavanagh was financially pressed. Most attributed this to his separation and divorce. One colleague recalled being mildly surprised when Cavanagh bought another car (1984 Blazer). He was upset in November 1984 about a raise which he considered inadequate. At about that time he had asked the company to pay him a $3000 referral bonus for his own employment. (They didn't.)

Page 559 of 3957

Page 560 of 3957

One colleague remembered that Cavanagh seemed to have a lot of credit cards. And a couple of people mentioned a recent two-week Club Med vacation in Mexico.

Cavanagh complained to the undercover agents that "everybody" knew his business. But in fact no one had any idea of the extent of his indebtedness.

When investigators reviewed Cavanagh's financial records, they found about 25 outstanding credit accounts, including two American Express cards (one green, one gold), two Master Card accounts and five Visa cards. In December 1984 his balance with Club Med was almost $17,000.

Overall, he owed more than $41,000, in addition to a $98,000 mortgage. He had managed to make most of his payments so far, and none of the creditors had yet taken legal action. But there were several past due notices and he clearly had more debt than he could manage for much longer.

Looking for loopholes

Several former supervisors remarked that Cavanagh often tried to "test" the system, to see how far he could bend the rules. But he generally fell into line when counselled or confronted.

This pattern held true in his handling of classified material. At the Advanced Systems Division Cavanagh regularly obtained classified documents from two control stations. The document control people at both locations remembered having trouble with him. He would often pull documents from the cabinet himself, which many employees did during busy periods.

But Cavanagh would sometimes try to walk out without signing a receipt. When challenged he would plead absent-mindedness or simply treat the process as a joke.

The control clerks learned to keep an eye on him. And they apparently succeeded in keeping tabs on his documents. All the classified items which Cavanagh handed over to the undercover agents were duly signed for—hence his anxiety to get them back to the plant as quickly as possible.

Cavanagh's attempts to disregard and dismiss security requirements are typical of an attitude which is frequently encountered, perhaps most frequently among senior executives or "technical types" who feel they have a claim to special exemption from the rules.

Security Awareness Bulletin #2-85 (December 1984) describes several cases of this kind, in an article entitled "Above the Law." These were cases of security violations which did not—so far as we know—involve actual espionage. But they still involved compromise and potential damage to national security.

Cavanagh was not allowed to circumvent the system. But his case is a reminder of just how dangerous this kind of attitude can be.

No easy answers

The "typical" spy has yet to be discovered and the behavioral profile that will let us recognize one every time has yet to be invented. The psychology of espionage is not a source of tidy conclusions.

Page 560 of 3957

Page 561 of 3957

But Cavanagh shows some traits which we've encountered before in other spy cases. Job and career dissatisfaction is a big one, especially when it involves a sense of resentment toward the organization. Financial difficulties and/or irresponsibility are old standbys. Cavanagh, in addition, showed some tendency to violent or disruptive behavior, some instances of dishonesty and a general lack of respect for authority and procedural process.

Still, none of this rose to the level where supervisors considered reporting it for security purposes. Cavanagh was not a model citizen, but his behavior was well within normal, or at least tolerable, limits—until, quite suddenly by all indications, he went over the edge and tried to sell out the country to make himself rich.

How do we distinguish the Cavanaghs, *before* the fact, from the many other cleared people who are simply having difficulties with life's normal trials and tribulations?

Unfortunately, we don't often distinguish them, until after the fact. And we can't—until and unless we know a lot more about human psychology.

But we *can* protect the documents and the information, as Northrup did, by applying the proper measures for accountability and control, as well as physical safeguards. None of that will prevent espionage. A clearance, like any other kind of trust, always carries the potential for betrayal. But controls can make spying a lot tougher and a lot more expensive and a lot more risky.

Mr. Cavanagh took the risk and lost. He'll be in prison for a long time. Others will be that much more reluctant to take the same chances.

Page 561 of 3957

APPENDIX E

UNITED STATES DISTRICT COURT, EASTERN DISTRICT OF NEW YORK AND SOUTHERN DISTRICT OF NEW YORK

UNITED STATES OF AMERICA

AGAINST

1. GENNADIY FEDOROVICH ZAKHAROV, DEFENDANT,

2. PREMISES KNOWN AND DESCRIBED AS THE SECOND FLOOR APARTMENT OF A TWO-FAMILY RESIDENCE LOCATED AT 6019 TYNDALL AVENUE BRONX, NEW YORK; AND

3. ONE 1982 BLUE PLYMOUTH RELIANT BEARING NEW YORK LICENSE PLATE 2281-ASJ

Affidavit for an Arrest Warrant and Search Warrant

(T. 18, U.S.C. § 794(c))

EASTERN DISTRICT OF NEW YORK, SOUTHERN DISTRICT OF NEW YORK, *ss:*

Daniel K. Sayner, being duly sworn, deposes and says that he is a Special Agent of the Federal Bureau of Investigation, duly appointed according to law and acting as such.

In or about and between April 1983, to and including the date of this affidavit, both dates being approximate and inclusive, within the Eastern District of New York and elsewhere, the defendant Gennadiy Fedorovich Zakharov (hereinafter "Zakharov") did knowingly and willfully combine, conspire and agree together with others known and unknown, to communicate, deliver, transmit and attempt to communicate, deliver and transmit to a foreign government, to wit, the Soviet Union, directly and indirectly, documents, writings, code books, instruments and other information relating to the national defense with the intent and reason to believe that it was to be used to the injury of the United States and to the advantage of a foreign nation, in violation of Title 18, United States Code, Section 794(a).

OVERT ACTS

In furtherance of the conspiracy and to effect the objects thereof, the following overt acts, among others, were committed in the Eastern District of New York and elsewhere:

1. On or about May 10, 1986, the defendant Zakharov met with a confidential source (hereinafter "CS") in Queens, New York, and entered into an agreement with "CS" whereby "CS" would be re-

Page 562 of 3957

Page 563 of 3957

quired to obtain classified information relating to the national defense for Zakharov and the Soviet Union. The defendant Zakharov made a payment to "CS" of a sum of money at this meeting.

2. On or about August 2, 1986, the defendant Zakharov met with "CS" in Queens, New York, and assigned "CS" the task of surreptitiously copying documents kept in a locked safe at "CS's" place of employment, a manufacturer of precision components for use in the engines of military aircraft and in radars, so that Zakharov could determine the importance of the information contained in the documents.

(Title 18, United States Code, Section 794(c))

Upon information and belief, there is presently concealed within the premises known and described as: (1) The second floor apartment of a two family residence located at 6019 Tyndall Avenue, Bronx, New York (hereinafter the "Premises") and (2) One 1982 blue Plymouth Reliant bearing New York license plate 2281-ASJ property; namely, 1) espionage paraphernalia including a) devices used to conceal and transmit classified and intelligence information; b) materials utilized by espionage agents to communicate among each other and with a foreign government; to wit, coded pads; secret writing paper; greeting cards and other documents containing microdots; microfiche and instructions in the use of the materials; recording and electronic transmittal equipment; and c) chemicals used to develop coded or secret messages; 2) books, records, documents and papers which reflect a) identities of foreign espionage agents; b) financial transactions including payments made to foreign espionage agents; c) telephone records reflecting contact among foreign espionage agents; 3) fingerprints of various persons who have visited or been at the Premises; and 4) other documents and paraphernalia that refer or relate to Zakharov's activities as an espionage agent. The aforedescribed property constitutes evidence of a violation of Title 18, United States Code, Section 794(c), to wit, conspiracy to transmit, deliver and communicate documents and information relating to the national defense to a foreign government with the intent or reason to believe that it is to be used to the injury of the United States and to the advantage of a foreign nation.

The source of your deponent's information and the grounds for his belief are:

1. "CS" is an individual known to your deponent to be a confidential source working for the Federal Bureau of Investigation. "CS" has provided information to your deponent for approximately the last one and one-half years regarding the defendant Zakharov's contacts with "CS" and has provided information to other agents since in or about April of 1983 regarding the defendant Zakharov's contacts. The majority of the meetings between the defendant Zakharov and "CS" described below which occurred from March of 1985 to August 2, 1986 have been tape recorded. The recordings corroborate "CS's" accounts of his meetings with Zakharov. In addition, surveillance agents of the Federal Bureau of Investigation have observed numerous meetings between Zakharov and "CS".

Page 563 of 3957

2. "CS" has informed agents of the Federal Bureau of Investigation that in April 1983, "CS" was approached by Zakharov on the campus of Queens College, New York, where "CS" was a third-year student majoring in computer sciences. Zarharov did not identify himself as a Soviet, but did tell "CS" that he worked at the United Nations doing scientific research. Zakharov requested "CS's" help in obtaining material of robotics and computer technology. Zakharov offered to pay "CS" a sum of money for "research time" necessary to obtain unclassified microfiche from local university libraries. At this first meeting Zakharov gave "CS" a list of specific microfiche relating to robotics and computers that "CS" was to obtain for Zakharaov. A second meeting was scheduled.

3. On or about May 3, 1983, a second meeting occurred between "CS" and the defendant Zakharov. During this second meeting, Zakharov identified himself as a Soviet and paid "CS" a sum of money even though "CS" had not located any material for Zakharov.

4. During the period from May 1983 to March 1985, Zakharov met with "CS" on numerous occasions, most often in Queens, New York, but also occasionally in Brooklyn, New York. In compliance with Zakharov's instructions during this period of time, "CS" would steal unclassified microfiche from various libraries and information centers and provide the microfiche to Zakharov. Zakharov continued to pay "CS" for his services.

5. As "CS's" graduation from Queens College approached in January 1985, the defendant Zakharov regularly encouraged "CS" to apply for a job with a high tech company. Zakharov paid "CS" to have professional résumés prepared to assist "CS" in obtaining such employment. Additionally, Zakharov advised "CS", in substance, that the Soviets would be willing to pay for educational expenses if "CS" wanted to go to graduate school.

6. During the period from in or about March 1985 through in or about May 1985, the defendant Zakharov discussed with "CS", among other topics, emergency meeting procedures, development of drop sites for the transfer of documents between Zakharov and "CS", and emergency signaling procedures. Zakharov further advised "CS", in substance, that he wanted to have a longterm relationship with "CS" and that "CS" should not be in this type of activity entirely for money but also to hurt America.

7. In or about September 1985, "CS" became employed at a company located in Queens, New York (hereinafter the "Company"). The Company manufactures unclassified precision components for use in military aircraft engines and in radars that are assembled by major defense contractors such as the Bendix Corporation and General Electric Corporation.

8. After "CS" began working for the Company, Zakharov's emphasis in the gathering of information shifted from seeking unclassified microfiche on technical subjects such as robotics, computers and artificial intelligence to seeking documents from the Company relating to the Company's manufacturing activities. For instance, on or about January 18, 1986, Zakharov instructed "CS" to photocopy the first few pages of the operating manuals for the machines that the Company uses to manufacture its military aircraft components. Zakharov stated to "CS", in substance, that by knowing the

Page 565 of 3957

type of machines the company uses, his "Institute" would be able to determine specifically what the Company manufactures. Zakharov also cautioned "CS" at this time that their relationship was no longer as innocent as it had been previously and that no one should know of their relationship. Your deponent believes that the "Institute" is a term that Zakharov uses to refer to his superiors in the United States and Moscow.

9. On or about March 15, 1986, the defendant Zakharov met with "CS" in Queens, New York. At this meeting, "CS" provided Zakharov with unclassified documents pertaining generally to the maintenance and manufacture of components of military aircraft engines. At this meeting, Zakharov asked "CS" if any materials at the Company to which he might have access were classified. Zakharov further discussed with "CS", in substance, whether "CS" would like to enter into an agreement with Zakharov pertaining to their clandestine relationship. At this meeting, Zakharov made payment of a sum of money to "CS".

10. On or about April 20, 1986, Zakharov met with "CS" in Queens, New York. At this meeting, Zakharov stated, in substance, that before Zakharov could make payment to "CS" for delivery of documents and information, Zakharov would first have to send the material to Moscow for their review.

11. During a meeting on May 10, 1986, which occurred on a subway platform in Queens, New York, Zakharov dicated an agreement to "CS" whereby "CS" would continue to work for the Soviets for a period of ten years, after which the agreement could be reconsidered and renegotiated. The agreement dictated by Zakharov to "CS" specifically included a provision that "CS" would be required, as part of his assignments, to obtain classified material for the Soviets which could not be obtained by a citizen of the USSR. The agreement entered into between Zakharov and "CS" further provided that the amount of payment to "CS" for his services would be based on the quality and quantity of the information provided by "CS". As Zakharov dictated the agreement, "CS" wrote it out on a piece of paper. "CS" then signed the agreement and handed it to Zakharov who retained possession of the agreement. Zakharov made a payment to "CS" of a sum of money at this meeting.

12. On or about May 31, 1986, the defendant Zakharov again met with "CS" in Queens, New York. During this meeting, Zakharov asked "CS", in substance, if any of the documents maintained in the Company's safe were stamped confidential or were restricted in any manner. Zakharov further urged caution on the part of "CS" in entering the Company's safe. Zakharov also requested that "CS" remain unmarried.

13. Shortly after this meeting, the defendant Zakharov travelled to the Soviet Unon where he remained until on or about July 20, 1986.

14. Upon Zakharov's return to the United States, he again met with "CS" in Queens, New York on or about August 2, 1986. At this meeting, Zakharov told "CS" that the "Institute" recommended that "CS" attend Queens College initially and then transfer to Brooklyn Polytechnic Insitute at a later time. Zakharov further stated, in substance, that he would pay "CS" a sum of money for graduate school plus additional expenses at their next meeting.

Page 565 of 3957

Page 566 of 3957

15. Also during this meeting of August 2, 1986, the defendant Zakharov sought more information from "CS" about "CS's" employment and, specifically, about the safe located at the Company. "CS" informed Zakharov that he had seen documents in the safe that bore the designations "(C), (U) or (O)," but that "CS" did not know what these designations meant. Zakharov instructed "CS", in substance, to attempt to copy some of the documents in the safe so Zakharov could determine if the material was important.

16. Investigation has disclosed that the defendant Zakharov currently resides at the premises and has resided there for over three years. On two occasions in 1986 on which Zakharov met with "CS", surveillance agents first observed Zakharov depart from the premises carrying a shoulder-strap gym-style bag. On both occasions, Zakharov was observed entering a 1982 blue Plymouth Reliant bearing New York license plate 2281-ASJ and driving off. On one of these occasions surveillance agents followed Zakharov and observed Zakharov drive the Plymouth Reliant to a location, park, exit the car and walk in the direction of a subway station, all the while carrying the shoulder-strap gym-style bag. On both of the occasions on which Zakharov was observed leaving the premises, Zakharov subsequently arrived at the designated meeting place carrying what appeared to be the same shoulder bag and met with "CS". Also on various occasions, Zakharov has mentioned to "CS" that he (Zakharov) has parked his car in Manhattan prior to meeting with "CS". Zakharov uses the shoulder bag to conceal documents provided to him by "CS" at their meetings. In your deponent's experience, automobiles used by espionage agents often contain counter-surveillance devices, such as scanners.

17. Investigation by agents of the FBI has determined that the defendant Zakharov is employed in the United States as a Scientific Affairs Officer assigned to the Center for Science and Technology for Development at the United Nations Secretariat in New York. He has been in the United States since in or about December 1982.

18. Your deponent has been assigned to the Foreign Counterintelligence Squad in New York City for the past two years. During this period of time, I have worked on more than a dozen cases involving Soviet and East European intelligence service operations and have therefore become thoroughly familiar with tactics, methods and operational techniques of the intelligence services of these countries. In your deponent's experience, and based on information provided to your deponent by other officials in the Foreign Counterintelligence area, Soviet and East European Intelligence agents utilize espionage paraphernalia including devices designed to conceal and transmit classified and intelligence information, materials used by espionage agents to communicate among each other and with a foreign government to wit, coded pads, secret writing paper, greeting cards and other documents containing microdots, microfiche together with instructions in the use of these materials, recording and electronic transmittal equipment, chemicals used to develop coded or secret messages; and books, records, documents and papers which reflect: a) the identities of foreign espionage agents; b) financial transactions including payments made to foreign espionage agents; and c) telephone records reflecting contact

Page 566 of 3957

Page 567 of 3957

among foreign espionage agents. It is also your deponent's experience that these materials are kept in safe houses and residences used by intelligence agents. Based upon the facts set forth above, it is your deponent's belief that the defendant Zakharov is a Soviet intelligence agent conducting espionage activities in the United States. Moreover, the investigation has established, as described above, that the premises known and described as the second floor apartment of a two-family residence located at 6019 Tyndall Avenue, Bronx, New York and one blue 1982 Plymouth Reliant bearing New York license plate 2281-ASJ are being used by an agent of Soviet Intelligence in the conduct of his espionage activities.

19. Agents of the Federal Bureau of Investigation presently plan to arrest the defendant Zakharov on Saturday, August 23, 1986, after he has received the latest batch of documents from "CS". It is anticipated that the arrest will occur on or after 4:00 p.m. on Saturday. Your deponent fears that confederates of the defendant Zakharov will be warned of the arrest when Zakharov fails to return promptly from the meeting and may attempt to destroy evidence of the conspiracy at the location to be searched. Therefore, your deponent requests that authority be given for agents to execute the warrant at any time of the day or night.

Wherefore, your deponent respectfully requests (1) that a warrant issue for the arrest of the defendant Gennadiy Fedorovich Zakharov, so that he may be dealt with according to law; (2) that a warrant issue allowing your deponent or any Special Agent of the FBI with proper assistance to enter at any time of the day or night the premises known and described as the second floor apartment of a two-family residence located at 6019 Tyndall Avenue, Bronx, New York and therein to search for property; namely, 1) espionage paraphernalia including a) devices used to conceal and transmit classified and intelligence information; b) materials utilized by espionage agents to communicate among each other and with a foreign government to wit, coded pads; secret writing paper; greeting cards and other documents containing microdots; microfiche and instructions in the use of these materials; recording and electronic transmittal equipment; c) and chemicals used to develop coded or secret messages; 2) books, records, documents and papers which reflect a) identities of foreign espionage agents; b) financial transactions including payments made to foreign espionage agents; c) telephone records reflecting contact among foreign espionage agents; 3) fingerprints of various persons who have visited or been at the apartment; and 4) other documents and paraphernalia that refer or relate to Zakharov's activities as an espionage agent.

DANIEL K. SAYNER,
Special Agent, Federal Bureau of Investigation.

Sworn to before me this 22nd day of August, 1986.
United States Magistrate, Eastern District of New York.

USIA

April 29, 1986

Senator David Durenberger
375 RSOB
Washington, D.C. 20510

FORGERY

Dear Senator Durenberger:

Now that there is conclusive evidence that [illegible] explosion of a Chernobyl nuclear power plant reactor produced a considerable quantity of radioactive fallout, we have a chance to utilize this fact for propaganda purposes. Furthermore, it is good for us that Moscow has made no official statement on the event.

Therefore we suggest that following steps should be taken:

- Reports should be spread by our associates in European information media giving the public the details of Chernobyl disaster:

  - number of victims should be alleged to be somewhere between 2,000 and 5,000;

  - mass evacuation of population from the 100-mile zone;

  - transport problems, shortage of various goods, chaos, and panic should also be given publicity;

  - appropriate illustrations and textual material should be provided;

  - campaign should be organized by USIA officials who should also supply the material needed.

- In view of the forthcoming Tokyo summit data should be provided for the statement on the Chernobyl disaster to be issued by the seven leaders.

- Considering the facts about the increased air pollution, our allies should be recommended to stop imports of food and other commodities from Eastern bloc.

- Our allies should be influenced so as to make a request for compensation for contamination of their territory.

We will keep you informed of any future measures.

Best regards,

Herbert Romerstein

Agency

Washington D C 20547

USIA

August 16, 1985

Dear General Schweitzer:

Enclosed is a copy of the forgery attributed to you.

We are able to draw some conclusions at this time.

1. The copy of the forgery in our possession was placed on the desk of an Italian journalist by an unknown person. It was in a plain white envelope. This method of surfacing a forgery is a well-known Soviet technique.

2. Based on information supplied by General Schweitzer, USIS Rome was able to convince the journalist that the letter was a forgery. As a result the perpetrators were compelled to use a Guatemalan "news service" known to be associated with the Cuban-Nicaraguan-backed insurgents to provide credibility to the Italian news agency that surfaced the forgery. This revealed the Cuban-Nicaraguan hand in the forgery.

3. General Schweitzer's evidence, provided to the Italian press service, was widely distributed both by them and USIA. Thus, the facts about the forgery are now well-known. Such exposes raise the cost to the forgers.

The following are preliminary findings of an unofficial but expert forensic examination of the forgery:

1. Paper: Not common in America.

2. Text: Possibly, the letterhead and the text were all printed on one machine, although it is difficult to determine from a copy. The letterhead does not appear to be "spliced" on.

3. Signature: Because the letter is a photocopy and the note provided was signed with a felt-tip pen it is difficult to say anything about the signature. However, it appears to be well executed. Lab would need several samples of the General's signature to determine such things as where he signs his name in relation to the signature bloc.

4. Comments: Based upon a cursory examination, it appears the document is an excellent forgery.

A linguistic examination of the forgery is now being done.

Lt. General Robert L. Schweitzer
Inter-American Defense Board
2600 16th St., N.W.
Washington, D.C. 20441

I am sorry that I did not get back to you earlier on this matter. We will continue to pursue this forgery and will keep you advised as we gain additional information.

Best regards,

Herbert Romerstein
Senior Policy Officer
on Soviet Active Measures

FORGERY

Estimado Sr. Presidente:

Me complace informar a Su Excelencia que la entrega a Chile del nuevo armamento solicitado será decidida en el más corto plazo. Me ha causado agrado al saber, a través del Sr.Motley, que usted ha mostrado vivo interés por ampliar nuestra cooperación en el terreno militar. Estimamos su profunda comprensión de las particularidades de la nueva situación internacional y de las iniciativas del presidente Reagan, encauzadas a fortalecer nuestra capacidad defensiva común.

Quisiera asegurar a Su Excelencia que seguirá usted contando con nuestro decidido apoyo en sus esfuerzos por fortalecer la libertad y la democracia en Chile.

Con respecto a nuestras acciones conjuntas en América Central, quisiera sugerirle la conveniencia de que las primeras unidades chilenas sean trasladadas a El Salvador y Honduras ya en marzo. Nuestros representantes en dichos países recibirán instrucciones dentro de dos semanas. Junto con su representante trataremos los demás problemas de nuestra cooperación en una de las próximas reuniones de la JID.

Con los mejores testimonios de mi más alta consideración y estima personal hacia Su Excelencia, saludo a usted

Muy atentamente,

Robert L. Schweitzer

DRAFT SENATE SECURITY MANUAL

FOREWORD

The United States Senate is obligated to safeguard the classified information we obtain and produce as a result of our legislative activities. To ensure that the Senate lives up to its obligations, this manual is published to establish uniform security practices within the Senate.

GLOSSARY	155

SECTION I. GENERAL

1. *Scope.* This manual establishes the requirements for safeguarding classified information to which employees of the United States Senate have access or possession. The manual is written in terms of the most common situations where the employee has access to, or possession of, classified information in the performance of assigned duties. It is the responsibility of every employee of

Page 573 of 3957

the Senate to be familiar with security requirements and to comply with them. If you have any questions regarding the proper safeguarding of classified information, or any problems relating to security matters in general, contact your office security manager for guidance and direction before you act.

2. *Designation of Senate Office of Security.* In order to insure that all Senate offices handle classifed information in a uniform and acceptable way, an Office of Senate Security has been created under the auspices of the Senate Majority Leader. The duties of the Director of the Senate Office of Security shall include the following:

a. Function as a central point within the Senate for the receipt, control, transmission, storage, and destruction of classified material.

b. Process clearance requests for personnel of the Senate.

c. Provide centralized recording and certification of clearances held by Senate personnel.

d. Administer a security awareness program, including security briefings and debriefings for the benefit of all Senate personnel.

e. Consult on security issues with Senate offices and conduct security surveys, inspections, and audits.

f. Conduct security liaison, both internal and external, on behalf of the Senate.

g. Such other duties related to personnel and document security which the Majority Leader may direct.

3. *Reports.* The Director of Security shall immediately submit in writing to the Majority Leader a report of any loss or compromise of classified material or information, or any other serious breach in Senate security procedures which merits the attention of the Majority Leader.

a. An annual report shall be provided to the Majority Leader on the number of security violations which resulted in disciplinary action being taken against Senate employees.

b. An annual report shall be provided to the Majority Leader on the number and types of clearances held by Senate employees.

SECTION II. HANDLING OF CLASSIFIED INFORMATION

1. *Policy.* Executive Order 12356 provides a uniform system for classifying, declassifying, and safeguarding national security information. This order assigns original classification authority to certain members of the Executive branch. Classified material originated by the Executive branch and under the custodial control of the Senate will be handled and safeguarded in accordance with the provisions of E.O. 12356 and this manual.

2. *Classification.* The assignment of classification involves a determination of the degree of protection certain information requires in the interest of national security. There are three categories of classified information: Top Secret, Secret, and Confidential. Classification of material may be supplemented by special designations and access requirements. Definitions of classification designations and other supplemental access designations may be found in the glossary of this manual.

Page 573 of 3957

3. *Marking Classified Material.* The originator of material which contains classified material is responsible for properly marking the security classification of the material. Classification designation by conspicuously marking serves to warn the holder what degree of protection is required for that information or material. Other notations facilitate downgrading, declassification, and aid in derivative classification actions. Therefore, it is essential that all classified material be marked in such a manner that it is clear to the holder what level of classification is assigned to the material. Although not required by this manual, those who originate material which contains classified information are urged to classify individual paragraphs within a document if deemed necessary.

a. The markings shown in paragraphs (1) through (4) below are required for all classified information. Some material, such as documents, letters, and reports can be marked easily with the appropriate markings. Marking other materials, such as ADP media and slides, will be more difficult due to size or other physical characteristics. Since the purpose of the markings is to warn the holder that the information requires special protection, it is necessary that all classified material be marked with the appropriate markings to the fullest extent possible to ensure it is afforded the necessary safeguards.

(1) *Identification Markings.* All classified material shall be marked to show the office responsible for its preparation, and the date of preparation. These markings are required on the face of all classified documents.

(2) *Overall Markings.* The overall classification of a document, or any copy or reproduction thereof, shall be stamped at the top and bottom on the outside of the front cover (if any), on the title page (if any), and on the outside of the back cover (if any).

(3) *Page Markings.* Interior pages of classified documents shall be stamped at the top and bottom with the highest classification of the information appearing thereon, or with the overall classification of the document.

(4) *Additional Markings.* In addition to the markings specified above, classified material shall be marked, if applicable, with one or more notations which indicate the material is further restricted to special access categories (e.g., Restricted Data notation and Dissemination and Reproduction notices).

4. *Record of Classified Material.* a. *Accountability Records.* The security manager of each Senate office shall maintain an accountability record of all Top Secret and Secret material, and special access materials regardless of classification. The record shall include all such classified material received or produced by, or in the custody of, the office and shall reflect as a minimum:

(1) The date of receipt.
(2) The classification of the material.
(3) The office which originated the material.
(4) The Senate Office of Security or Committee control number.
(5) A brief unclassified description of the material.
(6) The disposition of the material and date thereof (e.g., file location, or return to the Senate Office of Security).

5. *Inventory/Accounting of Classified Material.* When directed by the Director of Security (approximately on a semi-annual basis), each Senate office shall make an inventory and accounting of all Top Secret and Secret material, and special access materials, and shall submit a report to the Director of Security. The inventory and accounting shall consist of the actual sighting of each item listed in the accountability records. The report of each office's holdings will then be checked against the records of the Office of Security to insure proper disposition has been made for all accountable classified holdings.

a. *Receipt of Classified Material.* As a matter of practice, all classified material destined for Members' offices should be received by the Senate Office of Security. In the event classified material is received by a Member's office directly, it should be taken to the Office of Security within one working day to be properly receipted for and brought under Senate control procedures.

b. *Production of Classified Material.* When an office produces Top Secret or Secret material, and special access materials, such documents must be registered with the Office of Security within one working day.

c. *Semi-Annual Review of Classified Material.* For the purpose of reducing to a minimum the quantity of classified material on hand at any given time, each Senate office shall establish a program for the semi-annual review of classified material. All Senate offices wishing to dispose of classified information or place it in long-term storage may forward it to the Office of Security (using proper receipting procedures) who will assume responsibility for the proper storage or destruction of same.

6. *Special Requirements for Secret and Top Secret.* It is essential that an up-to-date record be maintained of all persons who are afforded access to Secret and Top Secret information. A record shall be maintained with each item of Secret and Top Secret material that shows the names of all individuals given access to the item and the date (or inclusive dates) on which access by each individual occurred. Such record shall be retained in the Office of Security for a period of three years from the date the material was destroyed, dispatched outside the Senate, declassified, or downgraded to less than Secret.

7. *Storage and Certification.* Classified material must never be left unattended. It must be secured in an approved storage container or under direct surveillance of an authorized person at all times. Senate offices will not be eligible to receive or store classified material until they have been certified by the Director of Security as having adequate storage capability. Classified material, when not in actual use, shall be stored as follows:

a. *Top Secret and Special Access—Cabinets and Vaults.* Top Secret and Special Access material shall be stored in a General Services Administration (GSA) approved security filing cabinet bearing a GSA Test Certification label or in a Class A vault constructed in accordance with the requirements of the Department of Defense Industrial Security Manual.

(1) Entry to the room in which the container or vault is located shall be controlled by a properly cleared employee so as

to control admittance to the room during normal working hours.

(2) During non-duty hours the room in which the container or vault is located shall be patrolled and each container or vault inspected by a Capitol Police Officer at least once during each four-hour period. The inspection procedure will be supervised by a system which provides a written record of the coverage.

b. *Secret and Confidential Cabinets.* Secret and Confidential material may be stored in a Top Secret cabinet or vault, or in a steel file cabinet secured by a steel bar and the three-position changeable combination padlock.

c. *Supervision of Storage Containers.* Only a minimum number of authorized persons shall possess the combinations to the storage containers or vaults, or have access to the information stored therein. To facilitate investigation of a container found open and unattended, a record shall be maintained by the Office of Security of the names, home phone numbers, and addresses of persons having knowledge of the combination. In addition, the combinations of storage containers in Members' offices shall be maintained, in a sealed envelope, by the Office of Security. Such envelope may be opened only at the direction of the Member or the office security manager. Cabinets and vaults in which classified information is stored shall be kept locked when not under the direct supervision of an authorized person entrusted with the combination or the contents.

d. *Alternate Storage Location.* The Office of Security shall maintain a list of all approved classified storage cabinets and vaults within the Senate. Each cabinet or vault listed shall be identified by location. In the event a cabinet or vault become damaged or inoperable in a Senate office, the Office of Security will provide temporary secure storage until such time the cabinet or vault is restored to good repair.

8. *Safeguards During Use.* Classified information is provided to a properly cleared person on the basis of a need-to-know. Determination of a need-to-know is an individual responsibility. Before divulging any classified information, Senate employees shall make certain of the recipient's identity, level of clearance, and need-to-know. The Office of Security will maintain a list of Senate employees whose level of clearance has been properly established. Classified materials, when not safeguarded as provided for in paragraphs 7a and 7b, and when in actual use by cleared personnel, shall be protected as follows:

a. Kept under the constant surveillance of an authorized person, who is in a physical position to exercise direct security controls over the material.

b. Covered, turned face down, placed in storage containers, or otherwise protected, when unauthorized persons are present.

c. Returned to storage containers as soon as practical after use.

9. *Transmission.* Transmission of classified material from Senate offices to any other Senate office, government agency, or other authorized recipients shall be registered with the Office of Security.

10. *Reproduction.* All reproductions of classified material shall be marked or stamped with the same classification as the original. Re-

production of classified material shall be made only on equipment specifically designated by the Director of Security for the reproduction of classified material. The Senate office which reproduces classified material is responsible for immediately bringing all copies under proper accountability controls and notifying the Office of Security of the particulars as provided for a paragraph 4, "Record of Classified Material."

11. *Exemptions.* Those Senate Committees which have custodial control over large amounts of classified material may be exempted from the provisions of Section II of this manual after the Director of Security has certified their policies and procedures for handling classified information fully meet the standards of this manual.

SECTION III. PERSONNEL SECURITY

1. *General.* A security clearance represents formalization of a determination that an individual is authorized access, on a "need-to-know" basis, to a specific level of classified information. Requests for clearance originate with and are validated by Members themselves (in the case of personal staffs), or, in the case of Senate Committee staffs, a determination by Committee or Subcommittee Chairmen and/or Ranking Minority Members, as specified in the Rules of each Committee.

2. *Clearance Standards for Senate Staff.* The criteria for security clearances require that nominees be individuals:

a. of excellent character, discretion, trustworthiness, and loyalty to the United States;

b. who are citizens of the United States.

3. *Investigative Requirements.* To ensure that personnel meet the criteria cited in paragraph 2 above, the following investigative coverage will be accomplished prior to granting a security clearance:

a. *Confidential and Secret.* A clearance for access to Confidential and Secret information shall require:

(1) A National Agency Check. This consists primarily of a check of the records of the Federal Bureau of Investigation, Office of Personnel Management, Immigration and Naturalization Service, and the Defense Central Index of Investigations.

(2) A personal interview either before or as part of the investigative process.

(3) A credit check.

(4) Written inquiries to present and past employers.

(5) Consent for access to financial records.

(6) Consent for further inquiries as may be necessary as a result of any unresolved issues surfaced in the investigation.

b. *Top Secret.* A clearance for access to Top Secret information requires, in addition to the requirements for a Secret clearance, a comprehensive field investigation of the nominee's background.

c. *Special Access Approvals.* Certain types of classified information require special clearances and access approval. These clearances and approvals are granted on a rigidly controlled need-to-konw basis. Requests from Committees or Subcommittees for staff clearances to special access programs will be processed on a case-by-case basis.

4. *Consultants or Contract Personnel.* Consultants or contract personnel must meet security approval criteria consistent with the sensitivity of assigned duties. Depending upon the proposed use of the individuals, specific investigative requirements will be established by the Director of Security at the time the request for security approval is submitted. In all instances, access to classified information will be limited to that needed in the performance of duty, as specified in the security approval. Any proposed change in the utilization of the individual requires submission of a request that a new security approval be granted.

5. *Denials and Terminations of Security Clearances.*

a. *Denial of Security Clearance.* If, after receipt of an investigative report, the Director of Security judges that a clearance should not be granted, the case will be discussed with the Member who requested the clearance. If the Member concurs, a denial is issued. If the Member does not agree with the assessment of the Director of Security, the matter will be reported to the Senate Majority or Minority Leader, depending on the requesting Member's party affiliation.

b. *Termination of Security Clearance.* The Director of Security will terminate staff security clearances of an individual if:

(1) the sponsoring Member requests such termination;

(2) the employee terminates employment with the Senate;

(3) the employee has committed security violation(s) of such severity as to warrant termination of clearances. If the sponsoring Member does not agree with the termination of a staff member's clearance, the matter will be reported to the Senate Majority or Minority Leader, depending on the Member's party affiliation.

6. *Reinvestigation and Revalidation Program.*

a. *Revalidation.* In order to maintain the number of Senate staff having access to classified information at a minimum, the Director of Security will revalidate the need for staff clearances on an annual basis with the sponsoring Member.

b. *Reinvestigation.* For those Senate employees holding security clearances and approvals, a reinvestigation will be conducted at least every five years. The Director of Security shall maintain a control system to insure such reinvestigations on staff members are accomplished.

c. *Requested Reinvestigation.* The Director of Security will also initiate a reinvestigation of a Senate employee at the request of the sponsoring Member.

7. *Secrecy Agreements.* A secrecy agreement must be executed by all Senate employees who are granted security clearances. The agreement will contain provisions that prohibit the signer from divulging or releasing classified information to unauthorized individuals. Where appropriate, the employee will be required to submit to the Executive branch, through the Director of Security, for prepublication review all writings, scripts, or outlines of oral presentations intended for non-Senate publication, which may contain material or information which the employee is pledged not to disclose by the terms of the secrecy agreement.

Page 579 of 3957

8. *Security Violations.* All security violations or alleged violations within the Senate will be investigated by the Director of Security. The formal investigation report will include:

a. A finding on whether a probable disclosure for classified information occurred.

b. A written report of those interviewed.

c. A finding as to the person(s) responsible.

d. A statement as to the degree of compromise involved.

e. The security violation history of each person found responsible.

f. Recommendations for remedial action to preclude recurrence of such violation(s).

9. *Penalties for Breaches of Security.* Senate employees who fail to observe security policies and procedures or who are found to be responsible for security violations are subject to the following administrative actions. These penalties are for inadvertent security violations that concern failure to properly secure classified information and do not involve either intent or gross negligence.

a. *First Violation.* Written notice by the Director of Security or the sponsoring Member and warning of possible consequences of further violations.

b. *Second Violation.* Written reprimand by the Director of Security or the sponsoring Member and warning of the possible consequences of subsequent violations.

c. *Third Violation.* Suspension without pay for a period of five days and a written warning from the Director of Security or the sponsoring Member as to the consequences of a fourth violation.

d. *Fourth Violation.* Suspension without pay for ten days and a complete review of the individual's security file by the Director of Security who will provide the sponsoring Member with the recommendation for a more severe penalty, if warranted. Such recommendation may involve a longer period of suspension without pay and/or result in termination of clearances or Senate employment. Where the recommended penalty is termination of clearances or employment, and the sponsoring Member does not agree, the matter will be reported to the Senate Majority or Minority Leader, depending on the Member's party affiliation.

e. *Two-Year Provision.* In the case of a Senate employee who has served two continuous years without a security violation of the nature set forth above, any violations that he or she committed prior to the commencement of the two-year period will be disregarded for purposes of determining whether a violation is the first, second, third, or fourth.

10. *Security Education and Awareness.* The Director of Security has overall responsibility for the security education program. The Director of Security will ensure that before the granting of a security clearance, Senate employees are briefed on the provisions of this manual as well as other pertinent security instructions. The security briefing and indoctrination will, at a minimum, include the following:

a. The employee shall read the espionage laws concerning disclosure of information relating to the national defense. The briefer will ascertain that the individual understands the espi-

Page 579 of 3957

Page 580 of 3957

onage laws and will clarify and emphasize responsibilities and consequences under the law if the statutes are violated.

b. The employee must attend a security education class prior to initial access and periodically thereafter. A mandatory requirement for the initial security education class will be the requirement for Senate employees to immediately report such contacts as explained in paragraph 14 of section III of this Security Manual.

c. The employee is required, as a condition of holding a security clearance, to sign a Secrecy Agreement with the understanding that termination of employment or such clearance does not relieve the individual of any obligations in the agreement concerning unauthorized disclosures of classified information.

11. *Termination of Security Clearances, Employment, or Extended Leave.* Those Senate employees whose security clearances have been revoked, whose employment has been terminated, or who are taking extended leave for a period of 60 days or more will:

a. Surrender before departure all classified documents or materials over which the Senate has custodial control.

b. Again read and be rebriefed on the espionage laws.

c. Be reminded that the Secrecy Agreement executed upon being granted a security clearance continues to be valid and that termination of employment or clearances does not release the individual from the conditions of the Secrecy Agreement. As a reminder of their continuing obligations, employees will be given a copy of their Secrecy Agreement upon separation.

12. *Security Responsibilities in Personal and Committee Offices.* A high level of security consciousness and good security practice is a basic responsibility of every person holding a security clearance. To achieve and maintain a strong security posture, a Security Manager will be designated for each Member's personal office and in all other Senate offices which receive or store classified information. Under the administrative guidance of the Director of Security, each office security manager will be responsible for the following duties:

a. Providing security advice and guidance to office personnel.

b. Serving as focal points within their offices for security matters.

c. Promoting general security awareness within their offices.

d. Monitoring office procedures for proper control and storage of classified material.

e. When directed by the Director of the Senate Office of Security, conduct an inventory of all Secret and Top Secret, and special access materials held within their office.

f. Retain a record of personnel within their offices who hold security clearances and who travel abroad. This report shall be maintained in a manner to be furnished by the Director of Security.

13. *Foreign Travel.* During foreign travel, Senate personnel are more accessible to foreign intelligence services. To minimize the threat to the individual or to classsified information, the Director of Security will establish procedures to provide for defensive briefings for persons planning private or official travel to designated

Page 580 of 3957

Page 581 of 3957

foreign countries. All Senate employees who hold clearances will, as a matter of routine, contact the Office of Security to arrange for a defensive briefing. Such will be provided if deemed necessary by the Director of Security. Since any traveler might become involved in an act of terrorism, hijacking, or piracy, guidance on what to expect and how to behave in such situations will also be made available to Members and Senate employees contemplating travel.

14. *Contact Reports.* All Senate personnel shall immediately report any contact with a foreign national of any nationality, either within or outside the scope of the employee's official activities, in which:

a. Illegal or unauthorized access is sought to classified information; or

b. The employee is concerned that he or she may be the target of an attempted exploitation by a foreign entity.

In addition, all cleared Senate personnel shall immediately report any contact, either within or outside the scope of the employee's official activities, with an official or representative of a governmental or commercial entity of the following communist countries: Albania, Bulgaria, Cuba, Czechoslovakia, German Democratic Republic, Hungary, Kampuchea, Laos, Mongolian People's Republic, Nicaragua, North Korea, People's Republic of China, Poland, Romania, Socialist Republic of Vietnam, Soviet Union.

Uncleared Senate personnel are also encouraged to report such contracts. Reports shall be made to the Director of Security who shall advise the FBI of the fact of the contact, unless the sponsoring Member or office security manager determines that the FBI should be informed directly.

Glossary

ACCESS—The ability and opportunity to obtain knowledge of classified information. An individual may be able to obtain classified information by being in a place where such information is kept, provided the security measures in effect do not prevent him from doing so.

AUTHORIZED PERSON—An individual who has established: (1) a need for access to, knowledge of, or possession of classified information, and (2) holds proper clearance to receive classified information. It is the responsibility of the person having control of the classified information to determine that the requester of the information has: (1) a need-to-know the material, and (2) clearance to receive it. (See also "Need-to-Know.")

CLASSIFICATION—The determination that official information requires, in the interests of national security, a specific degree of protection against unauthorized disclosure, coupled with a designation signifying that such a determination has been made.

CLASSIFIED INFORMATION—Official information, including foreign classified information, that has been determined, pursuant to statute or executive order, to require protection in the interests of national security.

CLASSIFY—To assign information to one of the three classified categories (Confidential, Secret, or Top Secret) after determination that the information requires protection in the interests of national security.

COMPROMISE—The known or suspected exposure of classified information to an unauthorized person.

CONFIDENTIAL—The designation applied to information or material the unauthorized disclosure of which could reasonably be expected to cause damage to the national security.

COURIER—Any cleared individual who has been authorized in writing to hand-carry classified material. Couriers are of two types: (1) those who carry material in connection with a specific trip and task to be accomplished, and (2) those who carry material as a regular part of their work assignment.

Page 581 of 3957

DERIVATIVE CLASSIFICATION—Classification based on or derivied from previous, officially classified material or prescribed in a security classification guide.

DOCUMENT—Any recorded information regardless of its physicial form or characteristics, including, without limitation, written or printed material, data processing disks, cards, and tapes; maps; charts; paintings; drawings; engravings; sketches; working notes and papers; reproductions of such things by any means of process; and sound, voice, or electronic recordings in any form.

FORMERLY RESTRICTED DATA—Data that have been removed from the Restricted Data category upon determination, jointly by the Department of Defense and the Department of Energy, that such data relate primarily to the military use of atomic weapons and that can be adequately safeguarded as classified defense information.

INDUSTRIAL SECURITY—That portion of national security concerned with the protection of classified information in the possession of industrial contractors to the Department of Defense or other user agencies.

MATERIAL—Any document, product, or substance on or in which information may be recorded or embodied.

NEED-TO-KNOW—A determination that a prospective recipient of classified information, in the interests of national security, has a clearance and a requirement for access to, knowledge of, or possession of the classified information in order to perform tasks or services essential to the fulfillment of a classified contract approved by a user agency.

OFFICIAL INFORMATION—Information that is owned by, produced by, or is subject to the control of the United States Government.

ORIGINAL CLASSIFICATION—An initial determination that information requires, in the interests of national security, a specific degree of protection against unauthorized disclosure. Such classification is not based on or derived from any previously classified material.

PUBLIC DISCLOSURE—The passing of information and/or material to any member of the public in any manner.

REPRODUCTION—The term reproduction, as used in this manual, means copying, duplicating, photographing, or otherwise making a facsimile, replica, or counterpart of an original article, regardless of the means used to copy or reproduce.

RESTRICTED DATA—All data (information) covering: (1) the design, manufacture, or utilization of atomic weapons; (2) the production of special nuclear material; or (3) the use of special nuclear material in the production of energy, but not to include data declassified or removed from Restricted Data category pursuant to the provisions of the Atomic Energy Act of 1954.

SECRET—The designation applied only to information or material the unauthorized disclosure of which could reasonably be expected to cause serious damage to the national security.

SENSITIVE COMPARTMENTED INFORMATION—All information and materials requiring special controls indicating restricted handling within present and future intelligence collection programs and their end products. These special controls are formal systems of restricted access established to protect the sensitive aspects of sources and methods and analytical procedures of foreign intelligence programs.

SPECIAL ACCESS PROGRAM—Any program imposing need-to-know or access controls beyond those normally prescribed for access to Confidential, Secret, or Top Secret information.

TOP SECRET—The designation applied only to information or material the unauthorized disclosure of which could reasonably be expected to cause exceptionally grave damage to the national security.

WASTE, CLASSIFIED—Preliminary drafts, carbon sheets, carbon ribbons, stencils, handwritten notes, backing sheets, stenographic notes, worksheets, and similar items containing classified information. Pending destruction, classified waste must be marked and safeguarded according to its classification.

COUNTER-INTELLIGENCE:

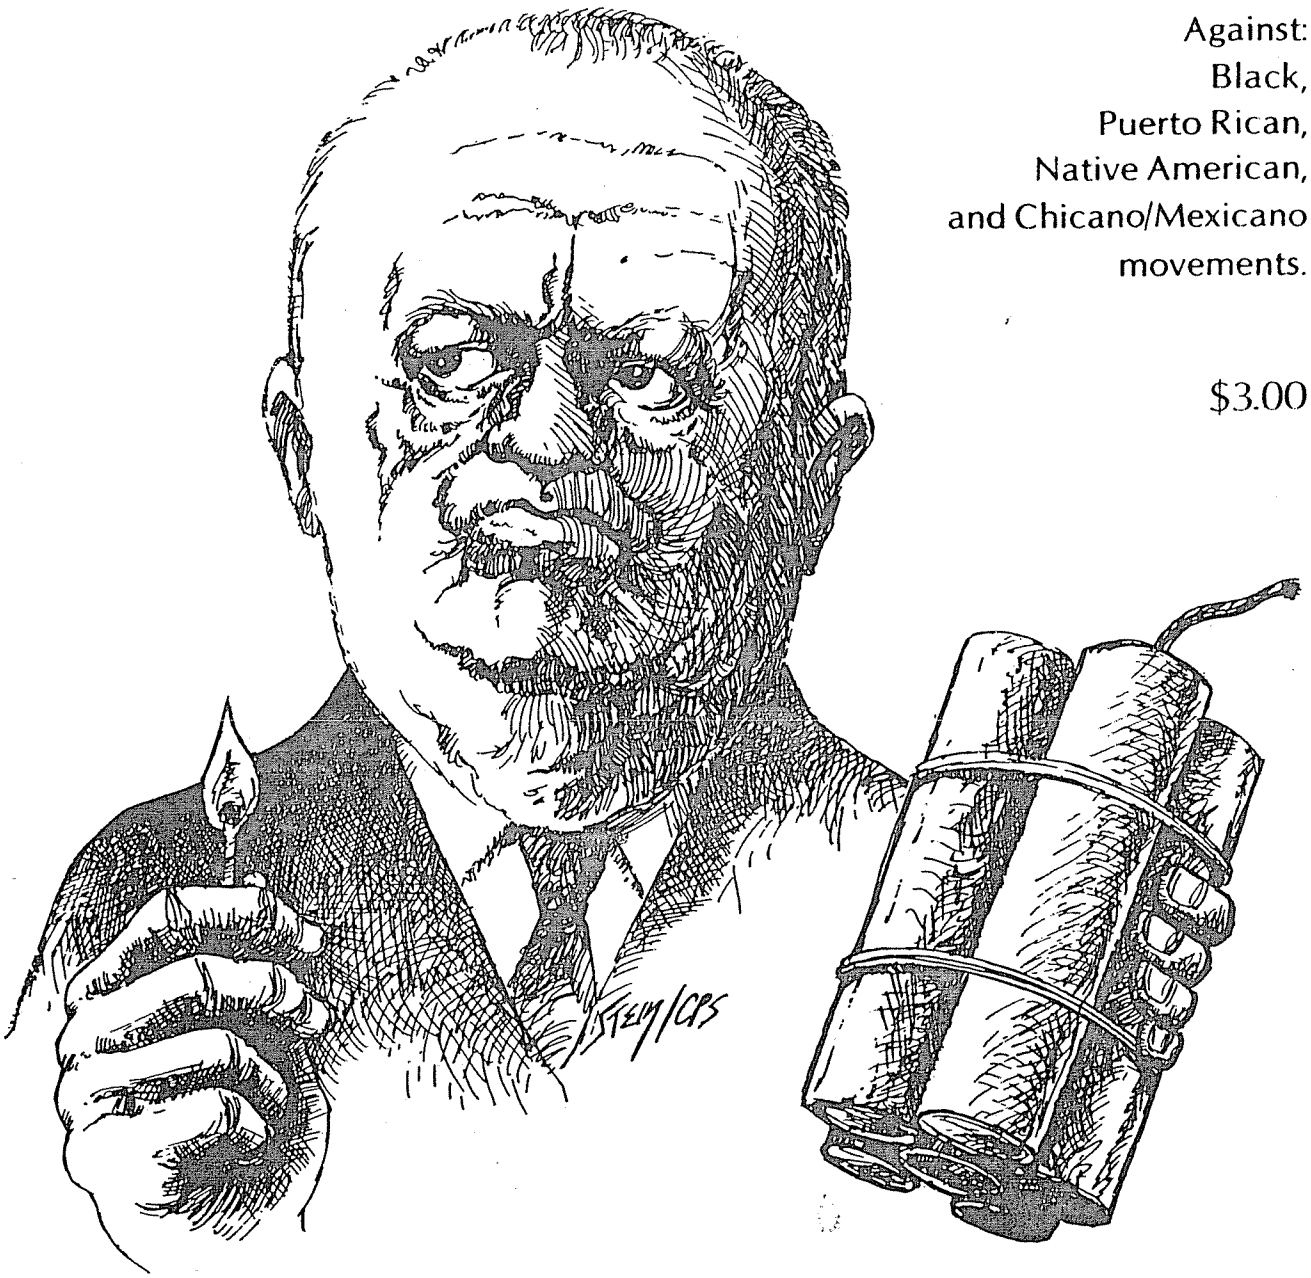
A Documentary Look at America's Secret Police

NLG

Volume One
revised and expanded

The FBI's Counterintelligence Operations Against: Black, Puerto Rican, Native American, and Chicano/Mexicano movements.

$3.00



Introduction

This collection of FBI documents and newspaper stories is designed as a resource and educational tool for lawyers and lay persons alike. Having spent the last few years studying and litigating against the FBI and its counterintelligence programs, we publish this collection in order to share our knowledge with those engaged in similar political and legal work.

We feel this publication is an important part of the task we set out for ourselves when we started the Task Force on Counterintelligence and the Secret Police at the National Lawyers Guild meeting in February 1978. At that time we decided to exchange information with and aid the litigation of those engaged in similar work; and to bring a political understanding and analysis to both the information collected and the work done which is consistent with the realities as we see them - an analysis which emphasizes that the repressive counterintelligence programs of the FBI and other secret police agencies were and are designed to systematically disrupt and destroy domestic Third World liberation movements and their leadership by any means necessary.

We wish to encourage others to bring this understanding to their work, and to move beyond omnibus spy suits and their attendant voluminous dossiers, and to focus on discovering and attacking past and present counterintelligence policies and tactics, with an eye toward aiding those victims of repression who are criminally charged or remain in prison as a result of these tactics. While this is a book composed primarily of documents, we do not see it as scholarly research with no other purpose than to satisfy historical curiosity; we hope it will be used as a tool by past victims of counterintelligence, and by the people who are the current targets of FBI harrassment.

We welcome your support and ideas, your criticisms, and especially your direct participation. Let's join together to hoist the secret police on their own petard!

Flint Taylor, and
Margaret Van Houten
Co-Chairs, NLG Task Force
on Counterintelligence
and the Secret Police
1/26/80

National Lawyers Guild Government Repression and Police Misconduct Committee - Counterintelligence Documentation Center - Suite 918 - 343 South Dearborn Street, Chicago, Illinois 60604

Editor's Note

This is the third edition of Counterintelligence: A Documentary Look at America's Secret Police. Since the last edition, we have collected and included in this book newly-released documents on the Republic of New Africa, American Indian Movement, former Black Panther Party leader Geronimo Pratt, and the continuing cover-up in the civil case concerning the murder of Fred Hampton and Mark Clark. While we feel the book is improved, we are by no means satisfied that we have gathered and published a definitive collection of documents. We therefore ask that those people reading this book contact us and send documents, newspaper clippings, and other materials that you feel would make our next edition more complete. We are especially interested in materials concerning the Chicano/Mexicano, Puerto Rican, and Native American movements.

To assist in the collection and dissemination of documentary materials regarding this area, the Government Repression and Police Misconduct Committee of the National Lawyers Guild has established a Counterintelligence Documentation Center in Chicago, Illinois. The Center makes available to interested persons over 20,000 pages of FBI files dealing with the New Left, Black Activists, Special Operations, and Media Program. The Center also coordinates the publication of the Police Misconduct Litigation Report newsletter, and the Public Eye Magazine, which recently merged with the Committee.

We would also like to inform our readers of two other groups who are doing significant work in the area of counterintelligence research and litigation - The National Task Force on Cointelpro Litigation and Research at P.O. Box 65, Bronx, New York 10473; and FOIA, Inc. at 36 West 44th Street, New York City 10036.

Please send any documents, synopses of files, or other materials to NLG Counterintelligence Documentation Center, Suite 918, 343 South Dearborn Street, Chicago, Illinois 60604. If you wish to be on our mailing list, please write us. For further information contact Chip Berlet, coordinator NLG/CDC at the above address or leave a message at the Chicago National Lawyers Guild (312) 939-2492.

Copyright 1980 - NLG Task Force on Counterintelligence and the Secret Police

(Ed. Note: In most cases the FBI memos are photocopies of original documents. Where reproduction was of a poor and illegible quality, we have retyped specific paragraphs, using similar type and margins. Not one word in those paragraphs has been deleted or altered. On some pages, different documents have been placed together, and are seperated by a wavy line to indicate the difference. Dashed lines indicate paragraphs have been removed for reasons of space and relevance.)

Table of Contents

PART ONE: **The Political Mission of the FBI** 1
Chicago Tribune 8/78 (FBI-KKK link in Birmingham) 4
FBI memos 1961 (FBI - local police - KKK cooperation) 4-5
FBI memo 11/15/60 (campaign against Puerto Rican groups) 6
FBI memo 8/4/60 (disrupt Puerto Rican Independence Movement) 7
FBI memo 6/12/61 (disrupt Puerto Rican Independence Movement) 8
FBI memo 1/22/69 (exacerbate Malcolm X/Nation of Islam dispute) 9
FBI memo 8/22/69 (exacerbate Malcolm X/Nation of Islam dispute) 10
Washington Star 11/19/75 (program to destroy Dr. King) 11
FBI memo 8/25/67 (neutralize and disrupt black movement) 12-14
Daily Defender 12/4/75 (destroy leadership of Dr. King 14
FBI memo 6/1/67 (have friendly columnist "expose" King-Spock) 15
Chicago Tribune 7/30/79 (manipulation of NAACP delegate election) 16
FBI memo 1959 (commendations for manipulating NAACP election) 16
FBI memo 3/4/68 (prevent rise of a "messiah," SAC directive) 17-21
FBI memo 5/15/68 (Dick Gregory: anonymous letter to Cosa Nostra) 22
FBI memo 11/25/68 (cripple B.P.P. and create dissension) 23
FBI memo 5/27/69 (attack B.P.P. breakfast program - scold SAC/S.F.) 24-27
FBI memo 12/2/70 (sabotage RNA purchase of land) 28
Chicago Daily News 12/3/75 (smear Rev. Charles Koen) 29
St. Louis Post-Dispatch 11/30/75 (smear Rev. Charles Koen) 29
FBI memo 10/23/68 (Chicago Eight trial as disruption technique) 30
FBI memo 1975 (informants as disruption technique for A.I.M.) 31
FBI memo 1/2/70 (disrupt United Farm Workers and S.D.S.) 32
Black Panther 2/4/78 (COINTELPRO in Mexico) 33
FBI memo 3/25/71 (extend COINTELPRO - effective in disruption) 34

PART TWO: **Violent Methods and Tactics** 35
New York Times 7/14/78 (FBI provocateur involved in Klan) 36
*Case Study: Black Panther Party 37-47
*FBI memo 11/29/68 (phony letter to cause vendetta between BPP/PFP) 37
*FBI memos (taking credit for causing widespread violence in BPP) 38
*FBI cartoons circulated to provoke violence between BPP and US) 39
*FBI memo 1/13/69 (Jeff Fort anonymous "hit" letter) 40-41
*Chicago Sun-Times 2/12/76 ("No Hits, No Guns, No Terror" column) 42
*FBI files - Floor plan of apartment where Fred Hampton murdered) 43
*FBI memo 12/11/69 (FBI takes credit for Hampton raid, asks bonus) 44
*Chicago Sun-Times articles on Hampton raid - 1976 45
*Articles on FBI provocateur William O'Neal 46-47
Chicago Tribune 6/27/75 (attempted assassination funded by FBI) 48
New York Times 1/11/76 (funding of right-wing terrorist group) 48

PART THREE: **Other Methods and Tactics** 49
FBI memo 5/14/70 (evaluation of Counterintelligence Program) 50-51
FBI memo 8/30/67 (phony arrests and prosecutions against RAM) 52-54
New York Times 3/13/75 (AIM informant Doug Durham) 55
FBI memo 3/16/73 (informants report excerpt - Wounded Knee) 55
FBI memo 9/16/70 (FBI lying encouraged - facts "immaterial") 56-57
FBI memos (snitch jacket implying Stokely Carmichael is agent) 58
FBI memo 12/2/68 (snitch jacket on BPP member - murder possible) 60
FBI memo 10/8/63 (FBI leaflets against Puerto Rican group) 61-62
FBI memo 10/10/68 (FBI racism and media manipulation) 63
FBI memo 5/21/69 (FBI article given to cooperative media) 64
FBI memo 3/16/73 (use of unwitting journalist as informant - AIM) 65

(Part Three: Other Methods and Tactics - continued)
*Case Study: American Indian Movement 66-72
*Article 6/26/76 (smear AIM with fabricated report) 66
*FBI memos (showing contradictory views on AIM purposes & FBI plans) 67
*FBI memo 4/24/75 (Wounded Knee assessment - call for less control) 68-69
*FBI memo 1975 (excerpt detailing information sharing) 69
*FBI memo 3/29/79 (re-assign AIM to Domestic Security section) 70
*FBI memo 1975 (assessment of AIM leader John Trudell as "eloquent") 70-71
*Public Eye article on arson deaths of family of John Trudell 71
*Chicago Tribune 3/14/75 (Senate probe asked into informant) 72
*FBI memo 6/27/75 (Senate probe dropped after FBI violence) 72
*Case Study: Republic of New Africa 73-77
*FBI memo 5/8/69 (phony meeting notices to cause disruption) 73
*FBI memo 3/11/71 (RNA rejuvenation prompts counterintelligence) 74
*FBI memo 8/17/70 (RNA conference disrupted through media plant) 75
*FBI memo 7/12/73 (Jackson SAC urges Obedele conspiracy prosecution) 76-77
*FBI memo 1976 (FBI says RNA actions not pre-planned or conspiracy) 77
*Case Study: Geronimo Pratt 78-82
*Letter from Rep. McCloskey proving FBI cover-up 78-81
*FBI memo 1/28/70 (counterintelligence against Pratt called for) 81
*FBI memo 1970 (phony leaflet mentioning Pratt) 82

PART FOUR: **Deception and Cover-Up** 83
FBI memo 1/9/70 and others (hiding role of FBI in disruptions) 85
FBI memo 8/9/68 (careful to disguise FBI-authored letter) 86
Washington Post 4/25/75 (Black Bag Jobs - Do Not File file) 87
FBI memo 7/19/66 (Sullivan memo on Black Bag Job procedures) 88-89
Chicago Sun-Times articles on evidence destruction by FBI 90
Articles on witholding of files and cover-up) 91
*Case Study: Panther Case cover-up 92-99
*Articles on files withheld by FBI and attorneys 92
*Articles on judge's actions in Panther case 93
*Article revealing secret communications between judge and Justice 94
*Excerpts from Judge's letters to Attorney General and investigator 95-96
*Article revealing Appeals Court Judge formerly with FBI 97-98
*Excerpts from material calling for defense of FBI 98-99
Use of judges in cover-up and counterintelligence 100-101
Chicago Tribune 4/28/78 (suppression of FBI burglary probe) 102
Seven Days 5/7/78 (shooting of William Sullivan) 103
FBI memo 7/15/64 (Counterintelligence as basic FBI policy) 104

Part One: The Political Mission of the FBI

The history of FBI counterintelligence and repression against the Black liberation movement began with the establishment of the Bureau itself, in 1919. In October of that year, J. Edgar Hoover, fresh from his exploits as Attorney General Palmer's "legal advisor" for the notorious Palmer raids, initiated a campaign against Marcus Garvey which resulted in his frameup on false fraud charges, and ultimately in his deportation as an "undesirable alien". Counter-intelligence tactics were employed against other Black leaders and spokespersons, such as Paul Robeson and Richard Wright, and may have been involved in Wright's mysterious death in Paris. As Blacks became active in the Communist Party, the FBI moved to destroy racial unity and play on racism within the Party. The Bureau further developed this technique in an extensive campaign to discredit the black Party leader Claude Lightfoot in the 1950's.

In the late 1950's and early 1960's the FBI moved to quash the growing civil rights movement in the South. Over one-fourth of all Klan members in the South were FBI agents and informants, and much violence against the civil rights movement can be directly attributed to these agents. One FBI provocateur, Gary Thomas Rowe, was an active participant in widespread Klan violence, including the murder of civil rights worker Viola Liuzzo, the bombing of a Birmingham church which killed four Black children, and the killing of a Black man during a racial disturbance in Birmingham in 1963. Much of the FBI's attention, as has now become well known, was focused on Dr. Martin Luther King, Jr. and the Southern Christian Leadership Conference(SCLC).

As early as 1960, the FBI started a comprehensive program, originating in Chicago, designed to disrupt and neutralize the Nation of Islam. Although the bulk of the files are still secret, released documents reveal that one of the primary purposes of this program was to exacerbate the tensions between Malcolm X and Elijah Muhammed, and these activities either directly or indirectly led to the assassination of Malcolm X in 1965. Also in 1960, the FBI ordered their field offices to begin counterintelligence activities to "thoroughly disrupt" the Puerto Rican Independence movement, especially the Puerto Rican Nationalist Party and what is now the Puerto Rican Socialist Party.

As the civil rights movement moved to the north, and urban ghetto uprisings punctuated Black people's demand for liberation, the FBI greatly expanded their counterintelligence programs against the Black movement and its leadership. In August of 1967 Hoover directed all field offices to establish a "black nationalist" counterintelligence program, designed to "expose, disrupt, misdirect, discredit and otherwise neutralize" Black nationalist organizations and their leaders. The Student Non-Violent Coordinating Committee (SNCC), SCLC, the Revolutionary Action Movement (RAM), the Nation of Islam, and the Deacons of Defense were specifically targeted, as were Stokely Carmichael, H. Rap Brown, the Honorable Elijah Muhammed, and Maxwell Stanford, among others.

On March 4, 1968, Hoover exhorted 41 field offices to redouble their counterintelligence efforts against the Black liberation struggle, instructing them to "prevent coalitions between militant Black nationalist groups", to "prevent the rise of a 'messiah' who could unify, and electrify, the militant black nationalist movement", and to "prevent the long-range growth of militant black nationalist organizations." One month later, Dr. King, the target of countless counterintelligence maneuvers which included wiretaps and bugs, blackmail, a suicide note, and an attempt to replace him with an FBI plant, was felled by an assassin's bullet, an assassination which still leaves many unanswered questions concerning the FBI's role, and reveals yet another FBI coverup.

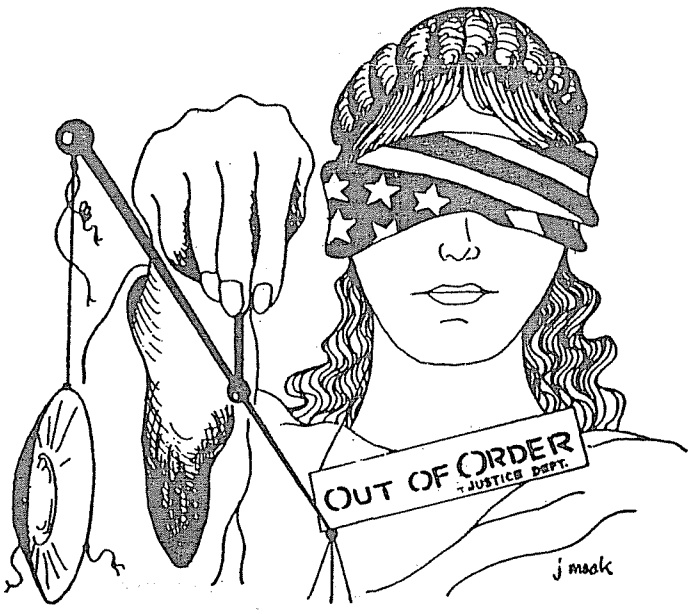
The Bureau set out to implement this expanded program with a vengeance. They moved to neutralize public figures such as Dick Gregory and Muhammed Ali, sought to disrupt militant Third World community organizations, and focused on revolutionary nationalist organizations and the Republic of New Africa (RNA), which had gained wide influence in the Black liberation struggle in early 1968 after declaring that all Black Americans (New Africans) were citizens of the Black nation, whose rightful land was 5 states of the deep South. Much energy was expended on discrediting Stokley Carmichael, who was branded by the FBI as a CIA agent.

It did not take long, however, for the FBI to make its main target the Black Panther Party. In late 1968, the Bureau sent out a communique to all field offices exhorting them to "cripple the BPP." For the next four years, in what the Senate Select Committee on Intelligence described as a "covert program to destroy the Black Panther Party," the FBI maintained a massive counterintelligence program, steeped in violence and illegality, against the Panthers. Determined to silence the strongest and most militant black revolutionary organization, the Bureau used everything from wiretap to murder. They coordinated police raids against Panther homes and offices throughout 1969, and set up the police murder of Fred Hampton, one of the youngest and most inspiring of all Black leaders, on December 4, 1969. They put special emphasis on disrupting the BPP's most successful programs, such as the Breakfast Program and the Black Panther Newspaper, and instructed all field offices to "destroy what they stand for." Although they focused on the Panthers, they also continued to disrupt the Young Lords, the Republic of New Africa, and the Nation of Islam; and worked hard to discredit Rev. Charles Koen, who was leading a heroic battle against Klan terror in Cairo, Illinois. The Bureau took credit for the demise of several Panther chapters, and for the 1971 split between Huey Newton and Eldridge Cleaver.

During 1971, the FBI office in Media, Pennsylvania was secretly entered by nameless American patriots, who managed to liberate a number of counterintelligence documents. The FBI then claimed that it was disbanding its counterintelligence programs, but, in fact, it has only charged the names. FBI counterintelligence against the American Indian Movement and Native American people across the country has intensified over the past several years, as the events at Wounded Knee and FBI terror on the Pine Ridge reservation show.

The FBI until recently orchestrated and coordinated violent attacks on the Iranian Student Association by agents of the Shah of Iran's Secret Police (SAVAK) in the United States, in order to crush the ISA in this country. The FBI and the Justice Department have resumed the inquisitional use of Grand Juries to jail Puerto Rican and Chicano activists, and have employed widespread intimidation and harrassment in Puerto Rican and Chicano communities to disrupt activities there. The FBI continues to assist in and condone violence against Native Americans. While Assata Shakur and Imari Obedele are no longer in prison, many other victims of FBI counterintelligence remain incarcerated, victims of set-ups and frame-ups: Geronimo Pratt and citizens of the Republic of New Africa, to name but a few. COINTELPRO continues. A tragic repitition of history occured when five members of the Communist Workers Party were slain by members of the Ku Klux Klan and American Nazi Party in Greensboro, North Carolina on November 3, 1979. The local police and FBI, who were aware of the intentions of the Klansmen and Nazis to disrupt the CWP demonstration -- and that they were armed -- did nothing to prevent the assault, and indeed, were many blocks away when the murders took place. The resemblance to the incident in Birmingham, Alabama almost twenty years ago that is recorded in FBI memos on pages four and five of this book, is chilling; and is also a reminder of the words of "The Director" J. Edgar Hoover, who said in a 1964 FBI memo:

> "Over the years, our approach to investigative problems in the intelligence field has given rise to a number of new programs, some of which have been most revolutionary, and it can be presumed that with a continued aggressive approach to these problems, new and productive ideas will be forthcoming. These ideas will not be increased in number or improved upon from the standpoint of accomplishments merely through the institution of a program such as COINTELPRO which is given another name, and which, in fact, only encompasses everything that has been done in the past or will be done in the future."



4

Documents detail FBI-Klan links in early rights strife

DETROIT [UPI]—Documents obtained by the American Civil Liberties Union show that in 1961 the FBI passed along information about two Freedom Rider buses to a Birmingham, Ala., police sergeant who was a known Ku Klux Klan agent.

Howard Simon, Michigan ACLU executive director, said the 3,000 pages of FBI letters, memos, and teletype messages were released to ACLU attorneys in a lawsuit filed against the FBI for allegedly failing to prevent Klan attacks on Freedom Riders.

"What we found in the documents was rather startling," Simon said Sunday. "The ACLU is charging that the FBI provoked the Klan to carry out terrorist acts against civil rights workers."

HE SAID DOCUMENTS show that the FBI knew Sgt. Thomas Cook of the police department's intelligence branch was giving the Klan the information that the FBI was providing about civil rights workers.

According to the documents, the chief of the Birmingham FBI office called Cook to inform him of the progress the buses were making through the racially tense South and when they were due to arrive at Alabama bus stations.

According to Simon, an FBI informant who had infiltrated the Klan said Cook and Birmingham's public safety director, Eugene "Bull" Connor, conspired with Klan leaders to allow physical attacks on Freedom Riders when the buses arrived at terminals in Birmingham.

THE DOCUMENTS, he said, show that Birmingham police agreed to arrive at the terminals 15 or 20 minutes after the buses arrived to give Klansmen time to attack the civil rights workers. Klansmen arrested after then were promised light sentences.

When buses arrived, no police were present. Klansmen attacked civil rights workers, reporters, and press photographers with chains, pipes, and baseball bats.

Earlier the same day, Klansmen intercepted a Freedom bus at Anniston, Ala., 50 miles to the east, and set it on fire.

"We found," Simon said, "that the FBI knew that the Birmingham Police Department was infiltrated by the Klan, that many members of the police department were Klan members, that they knew a person in intelligence was passing information directly to leaders of the Klan, and they also knew that their undercover agent had worked out an agreement with the police department to stay away from the terminals.

"THEY KNEW ALL that, and yet they continued their relationship with the police department."

The documents were released to attorneys for Walter Bergman, 80, a former Wayne State University professor and Detroit school board official who has filed a $1 million lawsuit against the FBI.

Chicago Tribune 8/78

BH 248-PCI (RAC), who has furnished reliable information in the past, orally furnished the following information:

On April 21, 1961, BH 248-PCI (RAC) telephonically contacted this Agent and advised that he had in his possession certain communications which he had received from one T. H. COOK, Sergeant of the Birmingham Police Department, which communications he had shown to ROBERT THOMAS, HUBERT PAGE, GENE REEVES and BILL HOLT, after the regular closed meeting of Eastview Klavern #13, of THE ALABAMA KNIGHT, KNIGHTS OF THE KU KLUX KLAN, INCORPORATED, on April 20, 1961.

He said he had received the inter-office communications from COOK, on the morning of April 20, 1961, and was given instructions to turn these over to ROBERT THOMAS and HUBERT PAGE, with the thought in mind that the KLAN could possibly reproduce the information contained in the communications on the KLAN press for distribution to the members of THE ALABAMA KNIGHTS.

COOK opened several file drawers in his filing cabinets and told informant that any information contained in his files was readily available to informant, for the use of the KLAN, in general.

Reference is made to matter entitled, "INFILTRATION OF LAW ENFORCEMENT AGENCIES BY KLAN-TYPE ORGANIZATIONS, RACIAL MATTERS" (Bufile [redacted]). The Bureau is aware that III Sergeant TOM COOK of the Birmingham Police Department has been furnishing information concerning potential violence given him by the Birmingham FBI Office to THE ALABAMA KNIGHTS, KNIGHTS OF THE KU KLUX KLAN, INCORPORATED.

On May 12, 1961, Birmingham Confidential Informant T-1, who has furnished reliable information in the past, advised that at a regular closed meeting of Eastview Klavern #13 of THE ALABAMA KNIGHTS, KNIGHTS OF THE KU KLUX KLAN, INCORPORATED, the arrival of the CORE group and KLAN intervention, on May 14, 1961, was discussed. All Klansmen were told to stay away from the Greyhound Bus Terminal, unless specifically instructed to participate in KLAN intervention.

After the closed meeting, according to T-1, HUBERT PAGE, Grand Titan of THE ALABAMA KNIGHTS, advised several persons that ROBERT SHELTON, Imperial Wizard, THE ALABAMA KNIGHTS, had spoken to Detective TOM COOK, Birmingham Police Department, date and time unknown, concerning CORE. PAGE further related that the CORE group was to arrive at approximately 11:00 A.M., May 14, 1961, at the bus depot, and that sixty Klansmen were to participate in the beatings.

PAGE further stated that EUGENE "BULL" CONNOR, Police Commissioner, Birmingham, Alabama, had stated, "By God, if you are going to do this thing, do it right", referring to the proposed incident on Sunday, May 14, 1961.

FROM SAC, BIRMINGHAM /149-NEW/ 6P

DIRECTOR OF NEWS, WAPI, HAS ADVISED ME THAT UPON HIS ARRIVAL AT THE TRAILWAYS BUS STATION THIS AFTERNOON

HE SAW A SHORT, HEAVY SET, WHITE MAN WEARING A YELLOW SHIRT, KNOCK A NEGRO MALE TO THE GROUND AND JUMP ON HIM, AND THAT IMMEDIATELY THEREAFTER SEVERAL MEN STARTED THROWING PEOPLE AROUND. HE STATED THAT HE SAW NO POLICE IN SIGHT, BUT DID SEE TWO NEWS PHOTOGRPAHERS TAKING PHOTOGRAPHS. HE STATED THAT THE NEGRO RAN OUT OF THE BUS STATION, HIS FACE WAS BLOØDY AND ONE OF HIS PANTS- LEGS RIPPED OFF.

UNITED STATES GOVERNMENT

Memorandum

TO : DIRECTOR, FBI (105-66754) DATE: 11/15/60

FROM : SAC, NEW YORK (105-32872)

SUBJECT: GROUPS SEEKING INDEPENDENCE FOR PUERTO RICO (COUNTERINTELLIGENCE PROGRAM) SUBVERSIVE CONTROL
(OO: San Juan)

Re Bureau letter dated 9/13/60.

A review of the files of the NYO has been made concerning the activities of Puerto Rican pro-independence groups which seek independence by other than peaceful means, as well as the files on the counterintelligence program as it relates to the Communist Party. It is believed that upon instituting a counterintelligence program in this field, efforts should be directed with the following aims in mind:

I. Disruption and discord.

II. Creating doubts as to the wisdom of remaining in the independence movement.

III. Causing defections from the indpendence movement.

The suggested means of obtaining these desired ends are as follows:

1) Exploiting factionalism within an organization.

Factionalism is a common fault within pro-independence groups and it is believed that this existing element can be developed, enlarged and exploited. As an example, after the demise of the Accion Patriotica

- P -

2 - Bureau (105-66754) (RM)
2 - San Juan (105-3353) (RM)
1 - New York (105-32872) (#413)

15 NOV 17 1960

EX-REC

Page 594 of 3957

SAC, San Juan (105-3353) August 4, 1960

Director, FBI (105-66754) PERSONAL ATTENTION

GROUPS SEEKING INDEPENDENCE
FOR PUERTO RICO
(SUBVERSIVE CONTROL)

The Bureau is considering the feasibility of instituting a program of disruption to be directed against organizations which seek independence for Puerto Rico through other than lawful, peaceful means.

Because of the increasing boldness apparent in the activities of such organizations, their utter disregard of the will of the majority, the inevitable communist and/or Soviet effort to embarrass the United States, and the courage given to their cause by Castro's Cuba, we must make a more positive effort, not only to curtail, but to disrupt their activities.

San Juan and New York should give this matter studied consideration and thereafter furnish the Bureau observations, suggestions and recommendations relative to the institution of such a program to reach the Bureau no later than 8/25/60.

In considering this matter, you should bear in mind the Bureau desires to disrupt the activities of these organizations and is not interested in mere harassment. No action should be taken in this program without Bureau authority, at any time.

A copy of this communication is designated for the Chicago Office and a copy for the Washington Field Office for information.

GROUPS SEEKING INDEPENDENCE FOR PUERTO RICO
(COUNTERINTELLIGENCE PROGRAM)
SUBVERSIVE CONTROL SECTION

In order to appraise the caliber of leadership in the Puerto Rican independence movement, particularly as it pertains to our efforts to disrupt their activities and compromise their effectiveness, we should have an intimate detailed knowledge of the more influential leaders as individuals.

The names of each of the leaders listed below are maintained in the Security Index.

SAN JUAN

[redacted]

NEW YORK

[redacted]na

Your files will contain descriptive information appropriate to our investigative reporting. We should, however, for the purposes of this program, delve deeply into that part of their lives which do not show on the surface; for example, we must determine their capabilities of influencing others, capabilities of real leadership, why the intense desire for Puerto Rico's independence, what they expect to gain from independence, and the support they have from other leaders and rank-and-file members. We must have information concerning their weaknesses, morals, criminal records, spouses, children, family life, educational qualifications and personal activities other than independence activities.

TO DIRECTOR, FBI (100-448006) DATE: 1/22/69

FROM SAC, CHICAGO (157-2209) (P)

SUBJECT: COUNTERINTELLIGENCE PROGRAM
BLACK NATIONALIST - HATE GROUPS
RACIAL INTELLIGENCE
(NATION OF ISLAM)

Reurlet, 1/7/69; Chicago letters 12/24/68 and 1/14/69.

ReBulet has been thoroughly studied and discussed by the SAC, the Supervisor, and Agents familiar with facets of the NOI which might indicate trends and possible future direction of the organization. The Bureau's concern is most understandable and suggestions appreciated.

Over the years considerable thought has been given, and action taken with Bureau approval, relating to methods through which the NOI could be discredited in the eyes of the general black populace or through which factionalism among the leadership could be created. Serious consideration has also been given towards developing ways and means of changing NOI philosophy to one whereby the members could be developed into useful citizens and the organization developed into one emphasizing religion - the brotherhood of mankind - and self improvement. Factional disputes have been developed - the most noteable being MALCOLM X LITTLE. Prominent black personages have publicly and nationally spoken out against the group - U.S. District Court Judge JAMES BENTON PARSONS being one example. The media of the press has played down the NOI. This appears to be a most effective tool as individuals such as MUHAMMAD assuredly seek any and all publicity be it good or bad; however, if the press is utilized it would appear it should not concentrate on such aspects as the alleged strength of the NOI, immoral activities of the leadership, misuse of funds by these officials, etc. It is the opinion of this office that such exposure is ineffective, possibly creates interest and maybe envy among the lesser educated black man causing them out of curiosity to attend meetings and maybe join, and encourage the opportunist to seek personal gain - physical or monetary - through alignment with the group. At any rate it is felt such publicity in the case of the NOI is not overly effective.

Re Miami airtels to the Director (copy to Chicago) 8/22/69, and 8/25/69.

At the present time, Chicago does not desire to rehash some of the exposes that occurred around the time of the defection of MALCOLM X LITTLE as top level sources could be endangered and future activities thereof curtailed.

Referenced Miami airtel dated 8/25/69, reflected [redacted] is attempting to locate statements of prominent government and police officials regarding dangers created by the NOI. Again, Chicago agrees that the constant hate teachings against the white race is most undesirable. This is especially true as it relates to the children of the membership who are indoctrinated from birth on to hate the white man.

In an effort to keep [redacted] proposed documentary current, the following observations are set forth:

Report of [redacted] dated 6/20/69, pages 49 - 53, copy available to Miami, sets forth full details regarding ELIJAH MUHAMMAD's statements concerning his version of law and order; sets forth data regarding a meeting of the minds between the NOI and the Chicago Police Department; and relates details concerning plans by the National Society of Afro-American Policemen, New York City, to honor MUHAMMAD and the NOI in June, 1969. While this is in no way meant to infer the NOI is a useful, integral

Washington Star

11

WASHINGTON, D.C., WEDNESDAY, NOVEMBER 19, 1975 Phone (202) 484-5000

By Norman Kempster
Washington Star Staff Writer

Looking gray and wan after a 2½-month bout with cancer, Sen. Philip Hart spent one of his first days back on Capitol Hill listening to a catalog of apparently illegal FBI activities that ranged from fomenting violence to suggesting suicide.

"Over the years, we have been warned about the dangers of subversive organizations . . . organizations that would incite and perpetrate violence, pit one American group against another. I think the story you told us today shows there is an organization that does fit those descriptions. It is the organization (the FBI) that has been most active in its warnings to be on guard against such organizations.

Hart's statement was the emotional peak of a hearing yesterday in which the committee's top two staff members, chief counsel Fritz Schwarz and minority counsel Curtis Smothers, took the lawmakers on a guided tour of 20 years of FBI files recording efforts to disrupt and destroy organizations ranging from the Ku Klux Klan to the Black Panthers.

According to Schwarz and Smothers, the most determined of all of the bureau's domestic counterintelligence activities was aimed at discrediting the Rev. Dr. Martin Luther King Jr., head of the Southern Christian Leadership Conference, and dissipating his influence in the black community.

SMOTHERS SAID the files show that Hoover was suspicious of King from the moment King first began to achieve national prominence with the Montgomery, Ala., bus boycott in 1956. One reason for the animosity, Smothers suggested, was King's criticism of Hoover.

By December 1963, shortly after the assassination of former President John F. Kennedy, the effort to discredit King began in earnest. An FBI memo summarizing a meeting devoted to ways of dealing with King contains 21 suggestions of methods of obtaining derogatory information.

Many of the ideas are phrased as questions. They include, "Can colored agents be of any assistance?" "What are the possibilities of using Mrs. King?" "Are there any disgruntled employes of SCLC?" and "What are the possibilities of providing a good-looking female plant in King's office?"

Also suggested were telephone taps and hidden microphones. The first of these was installed the next month.

In all, 16 microphones were planted in hotel rooms used by King during the next few years. There also were several telephone taps.

SHORTLY BEFORE King was to leave for Stockholm in 1965 to receive the Nobel Peace Prize, the FBI sent King an anonymous letter which seemed to be a suggestion that he kill himself. The letter was accompanied by a tape recording of some of the hotel room bugs.

"King, there is only one thing left for you to do," the letter said. "You know what it is. You have just 34 days (the number of days before the Nobel ceremony) in which to do it. . . . You are done. There is but one way out for you."

King did not kill himself. But another FBI dirty trick may have indirectly contributed to his assassination in April of 1968.

The FBI files show that the bureau leaked to a friendly reporter that King was staying in the white-owned Holiday Inn during his participation in a sanitation workers strike that included a boycott of white-owned businesses. A bureau memo said King should be called a hypocrite because he was not staying in the Lorraine, a black-owned and black-patrionized motel.

King did check into the Lorraine where he was shot to death April 4 while standing on a balcony. The FBI contends that he had checked into the black-owned motel before the reports of his stay at the Holiday Inn had surfaced.

IN 1963, former Asst. FBI Director William Sullivan suggested to Hoover that the bureau pick and develop a "national Negro leader" to take King's place. Hoover approved the plan, but apparently nothing ever came of it.

Smothers said the FBI had in mind a black who was prominent in a field other than civil rights. Smothers said the individual, whom he would not name, apparently never knew of the plan.

An obsession with communism runs through the documents that were either released or read.

An April 24, 1964, memo from Hoover to the special agent in charge of the New York office called for renewed investigation of a civil rights leader, whose name was removed before the document was made public: "The bureau does not agree with the expressed belief of the New York office that (deleted) is not sympathetic to the party cause. While there may not be any evidence that (deleted) is a Communist, neither is there any substantial evidence that he is anti-Communist."

AN EXCHANGE of memos between Hoover and Sullivan in mid-1963 illustrates Hoover's determination to find Communist influence even where it might not exist and spotlights the problems of working for the often irascible director.

Sullivan at first said an investigation had turned up no evidence of substantial Communist penetration of the civil rights movement. Hoover penned at the bottom of the memo a sarcastic note that Sullivan once doubted Communist influence on Fidel Castro.

Sullivan took the hint. He shortly wrote a memo noting that "the director is correct."

"When it came to blacks, the most violent types of methods seemed to be acceptable," Smothers said. "If they were going to have gang fights and if they were going to be killing each other, it seemed to be an opportunity to promote it."

COUNTERINTELLIGENCE PROGRAM
BLACK NATIONALIST - HATE GROUPS
INTERNAL SECURITY

Offices receiving copies of this letter are instructed to immediately establish a control file, captioned as above, and to assign responsibility for following and coordinating this new counterintelligence program to an experienced and imaginative Special Agent well versed in investigations relating to black nationalist, hate-type organizations. The field office control file used under this program may be maintained in a pending inactive status until such time as a specific operation or technique is placed under consideration for implementation.

The purpose of this new counterintelligence endeavor is to expose, disrupt, misdirect, discredit, or otherwise neutralize the activities of black nationalist, hate-type organizations and groupings, their leadership, spokesmen, membership, and supporters, and to counter their propensity for violence and civil disorder. The activities of all such groups of intelligence interest to this Bureau must be followed on a continuous basis so we will be in a position to promptly take advantage of all opportunities for counterintelligence and to inspire action in instances where circumstances warrant. The pernicious background of such groups, their duplicity, and devious maneuvers must be exposed to public scrutiny where such publicity will have a neutralizing effect. Efforts of the various groups

to consolidate their forces or to recruit new or youthful adherents must be frustrated. No opportunity should be missed to exploit through counterintelligence techniques the organizational and personal conflicts of the leaderships of the groups and where possible an effort should be made to capitalize upon existing conflicts between competing black nationalist organizations. When an opportunity is apparent to disrupt or neutralize black nationalist, hate-type organizations through the cooperation of established local news media contacts or through such contact with sources available to the Seat of Government, in every instance careful attention must be given to the proposal to insure the targeted group is disrupted, ridiculed, or discredited through the publicity and not merely publicized. Consideration should be given to techniques to preclude violence-prone or rabble-rouser leaders of hate groups from spreading their philosophy publicly or through various mass communication media.

Many individuals currently active in black nationalist organizations have backgrounds of immorality, subversive activity, and criminal records. Through your investigation of key agitators, you should endeavor to establish their unsavory backgrounds. Be alert to determine evidence of misappropriation of funds or other types of personal misconduct on the part of militant nationalist leaders so any practical or warranted counter-intelligence may be instituted.

Intensified attention under this program should be afforded to the activities of such groups as the Student Nonviolent Coordinating Committee, the Southern Christian Leadership Conference, Revolutionary Action Movement, the Deacons for Defense and Justice, Congress of Racial Equality, and the Nation of Islam. Particular emphasis should be given to extremists who direct the activities and policies of revolutionary or militant groups such as Stokely Carmichael, H. "Rap" Brown, Elijah Muhammad, and Maxwell Stanford.

At this time the Bureau is setting up no requirement for status letters to be periodically submitted under this program. It will be incumbent upon you to insure the program is being afforded necessary and continuing attention and that no opportunities will be overlooked for counterintelligence action.

This program should not be confused with the program entitled "Communist Party, USA, Counterintelligence Program, Internal Security - C," (Bufile 100-3-104), which is directed

Letter to SAC, Albany
RE: COUNTERINTELLIGENCE PROGRAM
BLACK NATIONALIST - HATE GROUPS

against the Communist Party and related organizations, or the program entitled "Counterintelligence Program, Internal Security, Disruption of Hate Groups," (Bufile 157-9), which is directed against Klan and hate-type groups primarily consisting of white memberships.

All Special Agent personnel responsible for the investigation of black nationalist, hate-type organizations and their memberships should be alerted to our counterintelligence interest and each investigative Agent has a responsibility to call to the attention of the counterintelligence coordinator suggestions and possibilities for implementing the program. You are also cautioned that the nature of this new endeavor is such that under no circumstances should the existence of the program be made known outside the Bureau and appropriate within-office security should be afforded to sensitive operations and techniques considered under the program.

No counterintelligence action under this program may be initiated by the field without specific prior Bureau authorization.

You are urged to take an enthusiastic and imaginative approach to this new counterintelligence endeavor and the Bureau will be pleased to entertain any suggestions or techniques you may recommend.

-3-

DAILY DEFENDER 12/4/75

Bare new data in FBI-King

BY DANIEL F. GILMORE

WASHINGTON (UPI)—Former Attorney Gen. Nicholas Katzenbach testified Wednesday that J. Edgar Hoover risked the reputation of the FBI—"his life's work—in a vendetta against Dr. Martin Luther King, Jr.

Katzenbach told the Senate Intelligence committee that when he was Attorney General during 1965-66, he knew of telephone wiretaps against King by the FBI and once ordered a tap on King's home phone ended.

But he said he learned later the FBI put electronic "bugs" in King's hotel room without authorization and used other "unlawful and grossly improper" tactics against King.

When questioned about three memos to him written by Hoover in 1965, giving what Katzenbach called "after-the-fact" notification of bugs in King's hotel room, he said the memos contained initials "that appear to be mine".

Also testifying was Ramsey Clark who gave no specifics about what he may have known when he was Attorney General in 1967-69, but said the FBI was trying "to destroy the desperately needed moral leadership of Martin Luther King."

"His vendetta against Dr. King, if successful, could have led to a civil strife of frightening magnitude."

DIRECTOR, FBI (100-3-104-34) 6/1/67

SAC, CHICAGO (100-32864)

COMMUNIST PARTY, USA
COUNTERINTELLIGENCE PROGRAM
INTERNAL SECURITY - C
(MARTIN LUTHER KING)

ReBulet 5/18/67 and NYlet to Bureau 5/25/67.

It is agreed that the CommunistParty's (CP) interest in a peace ticket headed by MARTIN LUTHER KING and BENJAMIN SPOCK offers the appearance of a counterintelligence opportunity. The reference to this matter in Bureau letter dated 5/18/67 obviously relates to the Presidential elections of November, 1968.

A reporter or columnist of national stature, properly briefed, could write an excellent account of the KING-SPOCK ticket. It is the sort of article or series expected of a first rate reporter with first rate sources.

It is suggested that the Bureau consider our comments as reflected above. Consider also a top columnist or reporter who might be interested in the KING-SPOCK story. It is emphasized that this person should be respected for his balance and fair-mindedness. An article or series by an established conservative would not adequately serve our purposes. In this area the Bureau might desire to consider a [redacted] A former confidant of [redacted] he has excellent sources throughout the government and is not too close to the current administration to be branded as a propagandist. [redacted] also would [illegible] the charge that he is attempting to discredit these men. Left standing would be the realization that [redacted] had good sources and came up with [redacted] in the midst of the Presidential campaign. And [redacted] would not be about to divulge the identity of his sources. Thus the Bureau would stand harmless.

It is not known whether the Bureau has information which would make [redacted] selection undesirable. If his selection is not feasible, there are others in the [redacted] field who could serve as well. But it is clear that this man [redacted] and should not be a protagonist for either those of the "hawk" or "dove" persuasion.

Since the contact with [redacted] would be made in [redacted] no specific recommendation is being made at this time.

16

FBI tried to manipulate vote of NAACP, files indicate

By Sean Toolan CT 7/30/79

COPIES OF FBI documents released Sunday indicate that the Chicago FBI office planned to manipulate a National Association for the Advancement of Colored People [NAACP] election in Chicago in 1959.

The documents, presented at a press conference at the Bismarck Hotel by Richard Gutman, a lawyer representing the Alliance to End Repression in a suit against the Chicago Police Department, also indicate that the Federal Bureau of Investigation office in Chicago suggested methods for sabotaging a planned 1968 Martin Luther King-Benjamin Spock campaign for President.

Gutman obtained the documents under the Freedom of Information Act, which gives the public access to previously secret government documents. The group has obtained previous FBI documents for use in the suit, which seeks to halt government spying on such groups.

The documents describe how the Chicago FBI office, through an infiltrator, learned that the NAACP's so-called "left caucus" planned to run a slate of candidates for delegates to the NAACP national convention.

THE FBI SENT an anonymous letter and made an anonymous phone call to Theodore A. Jones, then president of Chicago NAACP, telling him that "two Communists" were on the slate, according to the documents.

The FBI went on to report that Jones kept the location of the delegate elections secret, and that Jones "packed the meeting with members of the United Steel Workers Union whom Jones had enfranchised for the meeting."

THE FBI HERE concluded in its report that "Chicago feels it has played a definite part in the defeat of a 'left caucus,' an attempt by the CP [Communist Party] to infiltrate a 'right led' organization."

J. Edgar Hoover, then the director of the FBI, later recommended a commendation for the agent who "suggested the anonymous letter," according to the documents.

Timuel D. Black, a professor of social science at Loop College, said Sunday he was a member of the so-called "left caucus" at the time and a candidate for the board of directors of the Chicago NAACP chapter.

"I was very shocked and a bit enraged to learn that the taxpayer-supported FBI had been interfering with the democratic process they were supposed to protect."

HE SAID HE knew something unusual was happening in the local NAACP when its members weren't even able to find out when and where meetings were being held.

"And when we found out about the meetings and went to them," Black said, "they were held in a high-handed, dictatorial manner. The decisions were arbitrary. We were cut off and cut out."

Black said members of the "left caucus" thought it was Chicago's Democratic machine that was interfering with their organization.

In 1967, according to the documents, the FBI here suggested a campaign to sabotage the King-Spock presidential campaign by recommending the name of a newspaper columnist to write an article attacking the campaign as "Communist-backed." Spock ran for president and King for vice president on the ticket.

THE DOCUMENTS released Sunday also indicate that the FBI here planned to "discredit Students for a Democratic Society [a radical group] in the eyes of the Negro community. And by appropriate sources organize an anti-SDS demonstration by a group of Negroes accusing the SDS of being white-oriented."

Other documents indicate the FBI tried to remove Herbert Mohammad as a possible successor to his father as head of the Nation of Islam, by going through his tax returns for possible irregularities.

Gutman charged that the files are "proof of the Chicago FBI's massive organized campaign of disrupting the exercise of First Amendment rights, of promoting enmity between groups, of disseminating derogatory information, and of manipulating the mass media."

THE ALLIANCE to End Repression and 32 other groups have presented the FBI files as evidence for a suit filed in November, 1974, which seeks a court declaration that the government spying be halted permanently.

Asked if he thought FBI spying was still going on, Gutman said: "It was supposed to have ended in 1970, but many cases we have show it continued after then."

To: SAC, Chicago (100-32864)

From: Director, FBI (100-3-104)

The Bureau was pleased to note that the "left caucus" was badly defeated in its efforts to elect nine candidates as delegates to the 1959 convention of the National Association for the Advancement of Colored People (NAACP) at the Chicago branch meeting of the NAACP in Chicago on 5-22-59.

It is suggested that if you have not already done so, you may desire to submit your recommendations for commendation of the Agent who suggested the technique of the anonymous letter to Theodore A. Jones, president of the Chicago branch of the NAACP, which apparently played a major role in alerting Jones to the danger the Communist Party posed to his organization.

5 4 MAR 18 1968

MAIL ROOM ☐ TELETYPE UNIT ☐

Airtel to SAC, Albany
RE: COUNTERINTELLIGENCE PROGRAM
BLACK NATIONALIST-HATE GROUPS

BACKGROUND

By letter dated 8/25/67 the following offices were advised of the beginning of a Counterintelligence Program against militant Black Nationalist-Hate Groups:

Albany	Memphis
Atlanta	Newark
Baltimore	New Orleans
Boston	New York
Buffalo	Philadelphia
Charlotte	Phoenix
Chicago	Pittsburgh
Cincinnati	Richmond
Cleveland	St. Louis
Detroit	San Francisco
Jackson	Washington Field
Los Angeles	

Each of the above offices was to designate a Special Agent to coordinate this program. Replies to this letter indicated an interest in counterintelligence against militant black nationalist groups that foment violence and several offices outlined procedures which had been effective in the past. For example, Washington Field Office had furnished information about a new Nation of Islam (NOI) grade school to appropriate authorities in the District of Columbia who investigated to determine if the school conformed to District regulations for private schools. In the process WFO obtained background information on the parents of each pupil.

The Revolutionary Action Movement (RAM), a pro-Chinese communist group, was active in Philadelphia, Pa., in the summer of 1967. The Philadelphia Office alerted local police, who then put RAM leaders under close scrutiny. They were arrested on every possible charge until they could no longer make bail. As a result, RAM leaders spent most of the summer in jail and no violence traceable to RAM took place.

The Counterintelligence Program is now being expanded to include 41 offices. Each of the offices added to this program should designate an Agent familiar with black

Airtel to SAC, Albany
RE: COUNTERINTELLIGENCE PROGRAM
BLACK NATIONALIST-HATE GROUPS

nationalist activity, and interested in counterintelligence, to coordinate this program. This Agent will be responsible for the periodic progress letters being requested, but each Agent working this type of case should participate in the formulation of counterintelligence operations.

GOALS

For maximum effectiveness of the Counterintelligence Program, and to prevent wasted effort, long-range goals are being set.

1. Prevent the coalition of militant black nationalist groups. In unity there is strength; a truism that is no less valid for all its triteness. An effective coalition of black nationalist groups might be the first step toward a real "Mau Mau" in America, the beginning of a true black revolution.

2. Prevent the rise of a "messiah" who could unify, and electrify, the militant black nationalist movement. Malcolm X might have been such a "messiah;" he is the martyr of the movement today. Martin Luther King, Stokely Carmichael and Elijah Muhammed all aspire to this position. Elijah Muhammed is less of a threat because of his age. King could be a very real contender for this position should he abandon his supposed "obedience" to "white, liberal doctrines" (nonviolence) and embrace black nationalism. Carmichael has the necessary charisma to be a real threat in this way.

3. Prevent violence on the part of black nationalist groups. This is of primary importance, and is, of course, a goal of our investigative activity; it should also be a goal of the Counterintelligence Program. Through counterintelligence it should be possible to pinpoint potential troublemakers and neutralize them before they exercise their potential for violence.

4. Prevent militant black nationalist groups and leaders from gaining respectability, by discrediting them to three separate segments of the community. The goal of discrediting black nationalistsmust be handled tactically in three ways. You must discredit these groups and individuals to, first, the responsible Negro community. Second, they must be discredited to the white community,

Airtel to SAC, Albany
RE: COUNTERINTELLIGENCE PROGRAM
BLACK NATIONALIST-HATE GROUPS

both the responsible community and to "liberals" who have vestiges of sympathy for militant black nationalist simply because they are Negroes. Third, these groups must be discredited in the eyes of Negro radicals, the followers of the movement. This last area requires entirely different tactics from the first two. Publicity about violent tendencies and radical statements merely enhances black nationalists to the last group; it adds "respectability" in a different way.

5. A final goal should be to prevent the long-range growth of militant black nationalist organizations, especially among youth. Specific tactics to prevent these groups from converting young people must be developed.

Besides these five goals counterintelligence is a valuable part of our regular investigative program as it often produces positive information.

TARGETS

Primary targets of the Counterintelligence Program, Black Nationalist-Hate Groups, should be the most violent and radical groups and their leaders. We should emphasize those leaders and organizations that are nationwide in scope and are most capable of disrupting this country. These targets should include the radical and violence-prone leaders, members, and followers of the:

Student Nonviolent Coordinating Committee (SNCC),
Southern Christian Leadership Conference (SCLC),
Revolutionary Action Movement (RAM),
Nation of Islam (NOI)

Offices handling these cases and those of Stokely Carmichael of SNCC, H. Rap Brown of SNCC, Martin Luther King of SCLC, Maxwell Stanford of RAM, and Elijah Muhammed of NOI, should be alert for counterintelligence suggestions.

INSTRUCTIONS

Within 30 days of the date of this letter each office should:

1. Advise the Bureau of the identity of the Special Agent assigned to coordinate this program.

Airtel to SAC, Albany
RE: COUNTERINTELLIGENCE PROGRAM
BLACK NATIONALIST-HATE GROUPS

The effectiveness of counterintelligence depends on the quality and quantity of positive information available regarding the target and on the imagination and initiative of Agents working the program. The response of the field to the Counterintelligence Program against the Communist Party, USA, indicates that a superb job can be done by the field on counterintelligence.

Counterintelligence operations must be approved by the Bureau. Because of the nature of this program each operation must be designed to protect the Bureau's interest so that there is no possibility of embarrassment to the Bureau. Beyond this the Bureau will give every possible consideration to your proposals.

NOTE:

See memorandum G. C. Moore to Mr. W. C. Sullivan captioned as above dated 2/29/68, prepared by TJD:rmm.

COUNTERINTELLIGENCE PROGRAM
BLACK NATIONALIST - HATE GROUPS
RACIAL INTELLIGENCE
(RICHARD CLAXTON GREGORY)

ReBulet 4/23/68.

Chicago airtel and LHM dated 5/2/68 and captioned "Richard Claxton Gregory" concern a speech by Gregory on 4/28/68 where he noted that "Syndicate hoods (are living all over. They are the filthiest snakes that exist on this earth." Referenced Bulet instructed you to develop counter-intelligence action concerning militant black nationalist Dick Gregory.

Consider the use of this statement in developing a counterintelligence operation to alert La Cosa Nostra (LCN) to Gregory's attack on LCN. It is noted that other speeches by Gregory also contain attacks on the LCN. No counterintelligence action should be taken without Bureau authority.

TJD:pag/mrm

Memorandum

TO : SAC, Baltimore

DATE: 11/25/68

FROM : Director, FBI

SUBJECT: COUNTERINTELLIGENCE PROGRAM
BLACK NATIONALIST - HATE GROUPS
RACIAL INTELLIGENCE (BLACK PANTHER PARTY)

DO NOT DESTROY
ATTORNEY'S COPY

For the information of recipient offices a serious struggle is taking place between the Black Panther Party (BPP) and the US organization. The struggle has reached such proportio that it is taking on the aura of gang warfare with attendant threats of murder and reprisals.

In order to fully capitalize upon BPP and US differences as well as to exploit all avenues of creating further dissension in the ranks of the BPP, recipient offices are instructed to submit imaginative and hard-hitting counterintelligence measures aimed at crippling the BPP.

Commencing December 2, 1968, and every two-week period thereafter, each office is instructed to submit a letter under this caption containing counterintelligence measures aimed against the BPP. The bi-weekly letter should also contain accomplishments obtained during the previous two-week period under captioned program.

All counterintelligence actions must be approved at the Bureau prior to taking steps to implement them.

overthrow the Government by revolutionary means, "There seems to be little likelihood of this." All information developed to date leads to the obvious conclusion that this group is dedicated to the principle of violent overthrow and will go to any length to further this aim.

You point out that the activities of the BPP have reached the black and white communities as evidenced by their weekly newspaper which has reached a circulation of 45,000. You have previously been instructed to review your files concerning this newspaper to determine whether we could disrupt the mailings of the publication. Your answer stated that you were not in a position to do this. You must immediately take positive steps to insure that we will be in a position to accomplish CIP objectives including the disruption of the mailing of their publications. You must develop adequate informant coverage to insure that we are in a position to accomplish all of our objectives, which include steps to counteract the impact this group has made.

You state that local and national newspapers continue to publicize information concerning the BPP. This fact automatically lends itself toward mass media disseminations to capitalize on this eagerness and to isolate the organization from the majority of Americans, both black and white. The dissemination of mass media information to selected and trusted newspapermen, pointing out the violent and dangerous nature of a group, has contributed measurably to the decline of the Ku Klux Klan in the United States Newspapers will print derogatory information much easier than they will print commendatory information, especially if the organization is by its nature violence-prone. For your information the San Diego Office has waged an effective CIP against the BPP which has measurably resulted in declining activities and considerable disruption.

26

Airtel to SAC, San Francisco
RE: COUNTERINTELLIGENCE PROGRAM,
BLACK PANTHER PARTY
100-448006

It is noted that BPP leader Bobby Seale speaks in schools and universities and receives fees of up to $1,000. This raises counterintelligence opportunities, among which are anonymous disseminations of derogatory information to universities and misuse of funds received.

As it concerns the BPP, you point out that results achieved by utilizing counterintelligence ideas such as publicizing the evils of violence, the lack of morals, the widespread use of narcotics and anonymous mailings, have not been outstanding. This is because a typical black supporter of the BPP is not disturbed by allegations which would upset a white community. You must recognize that one of our primary aims in counterintelligence as it concerns the BPP is to keep this group isolated from the moderate black and white community which may support it. This is most emphatically pointed out in their Breakfast for Children Program, where they are actively soliciting and receiving support from uninformed whites and moderate blacks. In addition, we have received information from San Francisco and other offices indicating that BPP officials are extremely suspicious of each other as to monies received. This also is a fertile ground for CIP and should be explored.

ReSFairtel states that nation-wide mailings to BPP chapter offices would automatically indicate that the FBI was the source. Mailings originating from Oakland, California, would logically be attributed to someone either at national headquarters of the BPP or a dissident who has recently resigned and had access to the records.

You state that the Bureau under the CIP should not attack programs of community interest such as the BPP "Breakfast for Children." You state that this is because many prominent "humanitarians," both white and black, are interested in the program as well as churches which are actively supporting it.

Page 614 of 3957

You have obviously missed the point. The BPP is not engaged in the "Breakfast for Children" program for humanitarian reasons. This program was formed by the BPP for obvious reasons, including their efforts to create an image of civility assume community control of Negroes, and to fill adolescent children with their insidious poison. An example of this is set forth in the May 11, 1969, issue of "The Black Panther." Page seven contains an article captioned "Black Panther Revolutionary Wedding." The article points out that two members of the Panthers were married at a church in Oakland, California, which is participating in the Breakfast Program. The crowd consisted mostly of Panther members and children from the Breakfast Program. Instead of a Bible, Bobby Seale used the "Red Book Quotations from Chairman Mao Tse-tung" to perform the marriage. After the ceremony, the children sang "We Want a Pork Chop Off the Pig."

The CIP in the San Francisco Office must be re-evaluated. During the reevaluation, give thorough consideration to the adequacy of the personnel assigned. Insure that you are utilizing the best personnel available in this program. Advise the Bureau of the results of your reevaluation by June 9, 1969.

Referenced airtel mentions several specific CIP proposals now pending. Instructions will be furnished pertinent offices by separate communication.

NOTE: San Francisco has furnished an evaluation of the CIP in that office as it affects the BPP. That office is not in line with Bureau objectives in the use of counterintelligence. We are calling attention to their derelictions and point out various situations where they should have proposed counterintelligence. We are calling for a reevaluation of the whole thinking behind counterintelligence in the San Francisco Office.

To: DIRECTOR FBI (100-448006) From: SAC, Jackson (100-980) (P) 12/2/70
II. OPERATIONS BEING EFFECTED III. TANGIBLE RESULTS

Since March, 1968, the Republic of New Africa (RNA) has been attempting to start a separate black nation in five southern states, starting with Mississippi. In this regard, the RNA has been trying to buy and lease land in Mississippi in the Jackson Division on several past occasions. (Counter-intelligence measures has been able to abort all RNA efforts to obtain land in Mississippi.)

In late July, 1970, RICHARD HENRY, aka Brother Imari, leader of the RNA, came to Jackson, Mississippi, accompanied by many out-of-state supporters to hold a national RNA meeting "on the land of the nation in Mississippi". This conference was disruptive and ineffective due to Jackson Division, Bureau-approved counterintelligence measures.

In mid-September, 1970, Brother IMARI and a few close associates of his came to look at land which was for sale in rural Hinds County, Mississippi, near Jackson; this land was owned by a Negro male who was retiring and owned over 560 acres. Jackson informants advised Bureau Agents of developments regarding this land and the fact that the owner of the land, [redacted], N/M, had advised Brother IMARI he will lease or sell him ten to twenty acres. RNA leaders, including Brother IMARI, were delighted over this land purchase or leasing prospect. Jackson informants were directed by contacting Agents to approach [redacted] privately and indicate to him that his selling land to Brother IMARI would not be a wise endeavor. Additionally, on 10/9/70, [redacted] was interviewed by Bureau Agents and advised of the true nature and violence potential of the RNA and its leaders. The interview lasted 1½ hours; following the interview, [redacted] indicated he would reconsider whether he would sell or lease any land to the RNA; on 10/21/70, Bureau Agents interviewed [redacted] who was assisting the RNA in their dealings with [redacted] regarding the land. The true nature and violence potential of the RNA and its leaders was explained to [redacted]

As a result of the above counterintelligence efforts, the land which the RNA had almost finalized plans regarding purchasing or leasing in rural Hinds County, Miss., has not been sold or leased to them. Jackson has maintained contact with [redacted] and he has advised he has no plans to lease or sell any land to the RNA in the immediate future. There have been no recent visits by top officials of the RNA to Mississippi regarding the land, it being noted they made several visits in September, 1970, when their prospects for the land purchase or leasing was good.

As a result of the above, intensive efforts of the RNA to obtain land in Mississippi over the past

Bare Hoover's smear tactic

WASHINGTON (AP) — The late FBI Director J. Edgar Hoover approved a plan to discredit a Midwest black militant leader with anonymous letters accusing him of adultery and of being a bureau informant, according to FBI documents.

The documents, made available by the Senate intelligence committee, show that the bureau's campaign against the Rev. Charles E. Koen lasted from 1968 to 1971 and was approved at each step of the way by Hoover. However, it was unclear whether the letters were ever actually sent to Mr. Koen, who a committee spokeswoman said is a minister in Cairo, Ill.

According to the FBI documents, the campaign against Mr. Koen began in November, 1968, with a proposal by St. Louis FBI officials to send him an anonymous letter criticizing him for referring to the possible use of violence in his public speeches.

THE LETTER would purport to be from members of Students for a Democratic Society in St. Louis and "would have an adverse effect on the consolidatory efforts of the SDS and the Black Liberators," according to the proposal approved by Hoover.

Two months later, Hoover authorized the FBI's Baltimore office to send an anonymous letter to the No. 2 man in the Black Liberator movement informing him that Mr. Koen was working for either the CIA or FBI. The letter, signed "A Soul Brother," said Mr. Koen "was in Baltimore last week and spent most of his time in the Justice Building. Don't know whether that cat was talking to CIA or FBI."

The FBI documents also include a 1969 memo from the head of the FBI's St. Louis office who claims the campaign forced Mr. Koen's resignation as head of the Black Liberators, a black militant group.

IN FEBRUARY, 1969, after Mr. Koen had resigned as head of the Black Liberators, the FBI chief in St. Louis proposed mailing an anonymous letter designed "to alienate (Koen) from his wife and cause suspicion among the Black Liberators that they have a dangerous troublemaker in their midst," an FBI document said.

The anonymous letter would be sent to Mrs. Koen telling her that her husband has "been making it here with Sister Marva Bass and Sister Tony and then he gives us this jive 'bout their (sic) better in bed then (sic) you."

It was to be followed by sending a copy of the anonymous letter to Mr. Koen with the note "I understand she recently received this letter . . . I suggest you look into this matter."

IN A MEMO authorizing the operation, Hoover directed the agents to "use commercially purchased stationery and take the other precautions set out to insure this cannot be traced to this bureau."

The next and final step in the FBI campaign against Mr. Koen came in February, 1971, when Hoover approved a proposal for circulating a cartoon sketch of Mr. Koen that "would emphasize the cost of Mr. Koen's attire and inquire as to the source of his funds."

At that time, Mr. Koen was head of the United Front in Cairo, which, according to the FBI memo, was a "predominately black organization which has been boycotting white merchants in Cairo for the past 20 months."

The plan to send the cartoon was proposed because "it is felt that any diminution of Mr. Koen's support in Cairo would be beneficial since he appears to be the single most important cause of confrontations occurring in Cairo."

St. Louis Post-Dispatch

Cairo Pastor Says FBI Lied To Bishop

By MARTHA SHIRK
Of the Post-Dispatch Staff

The Federal Bureau of Investigation sent an anonymous letter to the ranking bishop of the Episcopal Church of the United States in 1971 in an attempt to discredit the United Front of Cairo, Ill., and to dry up its major source of funds, says the Rev. Charles Koen, the United Front's leader.

He said documents scheduled to be made public this week by the United States Senate Select Committee on Intelligence would disclose a pattern of harassment, including attempts to cause disagreements among the leaders of the Cairo group, provoke marital squabbles and cut off its outside financial support.

He said a committee staff member had traveled to Cairo in recent days and had shown him the letter in question. The staff member, reached by telephone Friday night, refused to comment and would say only that the facts would be disclosed this week.

The Rev. Mr. Koen said the staff member had told him that the FBI had sent an anonymous letter in 1971 to the Right Rev. John E. Hines, then the presiding bishop of the Episcoal Church.

The letter, which was written from the viewpoint of a concerned parishioner, called the United Front a violent organization and said its leaders had used donations from the church to buy weapons, the Rev. Mr. Koen said.

In 1970, the national Episcopal Church donated more than $75,000 to the United Front, a community-based self-help group with branches in East St. Louis and St. Louis. But the Rev. Mr. Koen said in an interview Friday that the church had denied the group a contribution for the next three years.

"And now we know why," he commented.

In 1969, the United Front, headed by the Rev. Mr. Koen, conducted boycotts and demonstrations against white-owned businesses in Cairo in an attempt to force the hiring of more black employes. Racial strife, and often exchanges of gunfire between the white and black communities, continued into the 1970s. The Rev. Mr. Koen, 29 years old, is assistant pastor of Cairo's First Missionary Baptist Church.

The government's right to continue full investigation of AIM and certain affiliated organizations may create relevant danger to a few citizen's privacy and free expression, but this danger must be weighed against society's right to protect itself against current domestic threats.

The Supreme Court has observed that "unless the government safeguards its own capacity to function and to preserve the security of its people, society itself could become so disorderly that all rights and liberties would be endangered." United States v. United States District Court, 407 U. S. 297, 312 (1972).

2. Scope of Investigation

Investigative Techniques

The key to the successful investigation of AIM is substantial, live, quality informant coverage of its leaders and activities. In the past, this technique proved to be highly effective, [redacted] As a result of certain disclosures regarding informants, AIM leaders have dispersed, have become extremely security conscious and literally suspect everyone. This paranoia works both for and against the movement and recent events support this observation. [redacted]

When necessary, coverage is supplemented by certain techniques which would be sanctioned in preliminary and limited investigations.

Physical surveillance is another useful technique and should be utilized when deemed appropriate.

No mail covers or electronic surveillance have been used to investigate AIM and none is anticipated at this time. [redacted]

F.B.I.'S MEXICAN COINTELPRO PLAN REVEALED

(Mexico City, Mexico) - The Federal Bureau of Investigation (FBI) conducted an intense campaign of violence, harassment and disruption against activists in Mexico, recently released FBI files have shown.

The Bureau's Mexican activities were similar to the notorious COINTELPRO operations in the U.S., directed against militant Black groups, the antiwar movement and other so-called "subversive" activities. In Mexico, the FBI organized and fomented bombings, shootings, and murder attempts. Bureau agents also worked closely with the U.S. border cops, against both Mexican and Chicano activists.

The campaign was carried out with the collaboration and tacit support of the Mexican government.

The FBI's disruption campaign was the subject of a recent four-part series in the Mexico City daily paper *Excelsior*. The articles were based on FBI files disclosed through the Freedom of Information Act. Virtually none of the files' contents on Mexico has been reported in U.S media, the *Militant* reports.

Excelsior reported that the FBI's activities were stepped up between 1967 and 1970, a period marked by the rise of mass struggles in Mexico.

Many of the documents described by *Excelsior* were confidential memos from then FBI director J. Edgar Hoover to the "legal attache" of the American embassy in Mexico City. The "legal attache" in most American embassies, according to former CIA agent turned Marxist Philip Agee, is in reality the head of the local FBI operation.

Hoover continually stressed that the Bureau's Mexican activities were to be kept top secret — obviously to cover the fact that the FBI, supposedly "restricted" to domestic surveillance, actually carries out illegal operations abroad.

In 1967, *Excelsior* reported, Hoover sent instructions to the FBI in Mexico City to prepare a plan for disrupting "subversive" student groups.

Later in 1967, the FBI head in Mexico's capital received congratulations from Hoover. The chief was "pleased by the wave of nighttime machine gunnings to divide subversive leaders."

These shootings bear remarkable similarity to plans carried out by the FBI in the U.S. to provoke disputes between Black groups that could lead to violence. The Black Panther Party was a prime target of such tactics.

Hoover also congratulated the "legal attache" in Mexico City for the "effective and strategic detonation of bombs" that the FBI had arranged or provoked.

In 1968, according to *Excelsior*, "the terrorist activity of the FBI was intensified as part of a broadening of counterintelligence operations."

Meanwhile, in Mexico, a powerful movement of students and working people demanding release of political prisoners had arisen. The movement frightened the Mexican government —and the FBI. A 1968 memo from Hoover reveals the FBI's infiltration of the movement: "With only 10 men in the demonstration that the radicals (students) are going to hold, it is not sufficient to consummate the plans that have been made," *Excelsior* quotes.

The Mexican government moved quickly to crush the growing movement. On October 2, 1968, a peaceful demonstration of thousands of people at the Tlatelolco Plaza in Mexico City was fired on by police and troops. Hundreds of protesters were killed.

The government minister responsible for the massacre, Luis Echeverria, became the president of Mexico in 1970. Echeverria had been a close contact of the CIA, Philip Agee reported in *Inside the Company*. The FBI continued its close collaboration with the Mexican government under the Echeverria administration, the files show.

A 1971 memo from Hoover tells the FBI's agents in Mexico to "make sure that the disruptions will be carried out by our undercover agents in meetings with subversive students without endangering the life of [name deleted]," *Excelsior* reported, explaining that this was an "indirect reference" to Echeverria.

FBI agents posed as agents of the Immigration and Naturalization Service (INS) to question people who "could be of interest in relation to national security," *Excelsior* quotes one memo.

Stories were planted by agents in border city newspapers urging citizens to inform on sons and daughters of neighbors who might be "subversives."

When mere harassment was insufficient, the FBI resorted to out-and-out frame-ups. One memo admits that U.S. police planted illegal drugs — heroin, cocaine, and marijuana — in the cars of Chicano leaders.

Mexican government agencies routinely collaborated with and turned over information to the FBI □

SUBJECT: COINTELPRO - BLACK EXTREMISTS
RACIAL MATTERS

To recommend 90-day progress letters submitted by 43 offices participating in this program be discontinued.

COINTELPRO is code word for counterintelligence program. By memorandum 2/29/68 the Director authorized submission of 90-day progress letters concerning captioned program for purpose of stimulating thinking in offices where black extremist activities are concentrated. Forty-three offices are currently participating in this project.

This program has as its objectives the neutralization of black extremist groups, the prevention of violence by these groups and the prevention of coalition of black extremist organizations. Since these offices have participated significantly in this program, it is felt we can now relax our administrative procedures by eliminating the 90-day letter. We will not suffer from this discontinuance as continued participation in this program by field is followed by individual Supervisors in Racial Intelligence Section, Domestic Intelligence Division. In addition, the Inspection Division analyzes each office's participation in this program during field office inspections. In view of the above and to streamline our operations, it is recommended these progress letters be discontinued. No change is required in any Bureau manuals.

ACTION: REC-20

If approved, the attached airtel advising of discontinuance of these 90-day letters will be forwarded to offices participating in this program.

Enclosure

WHA:sef (11)

APR 1 1971

APR 5 1971

Part Two: Violent Methods and Tactics

FBI counterintelligence employed its most violent and illegal tactics against third world liberation movements, especially the Black Panther Party. They sought to provoke street gangs and other organizations such as the United Slaves organization in Southern California to engage in violence against the BPP. During 1969, four Panthers, including leaders Bunchy Carter and John Huggins, were killed by U.S. members (or FBI provocateurs) in incidents which the FBI helped to provoke and claimed credit for.

In Chicago, the FBI contemplated inciting the Mafia against Dick Gregory, and intentionally provoked Blackstone Ranger leader Jeff Fort in the hope that he would violently "retaliate" against Hampton and other Panther leaders. The Bureau, through their informants, falsely labelled Panthers and other Blacks as informants, although they recognized that this could lead to physical harm. Their most trusted informants, such as William O'Neal and Darthard Perry, acted as provocateurs, encouraging and participating in illegal and violent acts such as robberies, bombings, building electric chairs, and bullwhipping those they branded as informants. Other illegal tactics included forgery, wiretapping, burglaries, unauthorized use of Internal Revenue Service materials, interception of mail, and assassination.

One of their most violent counterintelligence policies was the use of raids on offices and homes of the Black Panther Party and other organizations throughout the country. In June of 1969, the FBI raided several Panther offices across the country, purportedly looking for George Sams, who later turned out to be an FBI provocateur. They would never apprehend him, but they would brand each raid a counterintelligence success after seizing or destroying almost everything in the offices, making bogus arrests, and generally disrupting the BPP.

Later in 1969 the policy changed. The FBI no longer executed the raids themselves, but employed local police forces--already at a fever pitch against the Panthers--to do their dirty work. In Chicago, FBI informant O'Neal obtained a floorplan of Fred Hampton's apartment, showing the bed upon which Hampton slept, which the FBI then gave to Edward Hanrahan's police who assassinated Hampton at 4:30 a.m. while he slept on that very bed. Four days later, in Los Angeles, the FBI passed a floorplan of the Panther offices to 300 L.A. police, who raided the offices in the early morning hours, and pumped thousands of rounds at the Panthers inside, who defended themselves and thereby miraculously avoided death.

In sum, FBI tactics of counterintelligence, as practiced against the Black liberation movement, were, and are, so violent, so unconstitutional, and so illegal, as to make a mockery of the law which the FBI is sworn to uphold.

POLICE GIVEN DATA ON BOAST BY ROWE

7/14/78

Reports May Back F.B.I. Informer in Klan on Killing in South

By HOWELL RAINES
Special to The New York Times

BIRMINGHAM, Ala., July 13 — Police sources here said today that they had information that might support Gary Thomas Rowe Jr.'s contention that he killed a black man during racial unrest in Birmingham in 1963, while Mr. Rowe was on the Federal Bureau of Investigation's payroll as an informer within the Ku Klux Klan.

The sources said a former Klansman and another man described as a Klan sympathizer told the police, in separate accounts, that Mr. Rowe had boasted to them that "I shot some niggers" during rioting that followed a double bombing in a black neighborhood.

A Birmingham police officer has also told city investigators that he saw Mr. Rowe with a pistol stuck in his belt near a police barricade like the one described by Mr. Rowe in his account of the killing.

Missing Report Is Sought

The investigators are now combing police files here for a missing report that they believe contains information about at least three unsolved shootings during the 1963 disturbances.

Meanwhile, another document has come to light that may add to the growing controversy over Mr. Rowe's involvement in racial violence while he was getting monthly payments from the F.B.I. In a statement to a Senate investigator in 1975, Mr. Rowe accused John Doar, former Assistant Attorney General for civil rights, of forcing him to change his account of the killing of Viola G. Liuzzo in 1965.

In the interview, Mr. Rowe said that Federal investigators ignored his report that a black man was also killed in Mrs. Liuzzo's car when Mr. Rowe and three Birmingham Klansmen chased down the Detroit woman's automobile on the night after she took part in a civil rights march from Selma to Montgomery. Mr. Rowe further alleged that Mr. Doar ordered him to keep silent when Mr. Rowe told Government prosecutors that he could not positively identify a black man called as a key Government witness as having been in the car with Mrs. Liuzzo at the time of the shooting.

The Liuzzo case brought Mr. Rowe national attention as the F.B.I.'s chief informer against the Klan in Alabama. He was later relocated and given a new identity by the bureau, and lives in an undisclosed location.

Mr. Rowe also told Senate investigators that the Justice Department, under its witness protection program, got him a job with a United States Marshal and allowed him to attend the Department of Justice Training Academy with 90 other Federal officers. Mr. Rowe charged that, because of his dispute with Mr. Doar, he was subsequently forced to resign the job, and that Marshal who employed him filed "false affidavits" in order to get Mr. Rowe an extra month's pay on which to find a job outside the Government.

Questioned in Church Bombing

When the authorities in Alabama reopened their investigations into the unsolved racial killings in the early 1960's, they contacted Mr. Rowe for information on the 1963 bombing that killed four black children at Sixteenth Street Baptist Church. But Mr. Rowe himself became a suspect in that case after two polygraph, or lie-detector, tests showed that he was giving "deceptive" answers when he denied having been with the group that planted the bomb.

Since that time there have been disclosures that indicate that Mr. Rowe may have participated in and helped to plan the Klan violence he was hired to observe.

A former leader of the Ku Klux Klan in Birmingham said today that Mr. Rowe helped direct the attacks on the Freedom Riders at a Birmingham bus station on May 15, 1961.

Mr. Rowe himself said, in an interview with Alabama investigators last fall, that he participated in the firebombing of the home of A. G. Gaston, a black millionaire, according to investigative documents.

In the same series of interviews, Mr. Rowe was quoted as saying he killed a black man during a riot here and was told by the F.B.I. agent to whom he regularly reported to keep quiet about the shooting. The agent named by Mr. Rowe has denied the report as "an absolute falsehood."

According to the Senate document that came to light today, Mr. Rowe said he was assured by F.B.I. agents here that his participation in violence had the personal endorsement of "The Man" — the late J. Edgar Hoover, then Director of the bureau.

'War' on the Klan

Mr. Rowe stated that "the quote to me was 'The Man has declared war on the Ku Klux Klan and that you are man enough to do, do it.' " Mr. Rowe stated that the "agent quivered, literally" in delivering this message and said "we don't have to worry about covering you any more."

The Birmingham Police Department's information about a possible shooting by Mr. Rowe was obtained, sources said, before disclosure by The New York Times that Mr. Rowe had told investigators that such a shooting took place.

The police inquiry here now is focusing on Mr. Rowe's activities after bombings on the nights of May 11 and Sept. 4, 1963. Rioting of the sort described by Mr. Rowe took place on both nights. By the accounts of Mr. Rowe and others, according to investigative documents, Mr. Rowe was in the riot area on both occasions.

Account of Shooting

The documents show that Mr. Rowe told a state investigator that he came upon blacks attacking a taxicab on Eighth Avenue here and beating a woman passenger. When the rioters turned on him, Mr. Rowe is quoted as saying, he shot a black man through the chest. Then, Mr. Rowe is reported to have said, he went to a barricade and reported the shooting to a policeman and later, by telephone, to his F.B.I. "control" agent.

According to an investigative source, a Birmingham policeman has told detectives here that during the riot on May 11, "he came down Eighth Avenue and stopped and got out of his car and Rowe was standing there in the middle of the road in civilian clothes with a gun stuck in his belt."

Later that same night, according to an investigative document, a fellow Klansman saw Mr. Rowe and talked to him at a telephone booth at 3 A.M. "At that time, Rowe stated to him that he had been uptown shooting Negroes," the document stated.

In a separate interview, the companion of the Klansman who gave that report supported the account without prompting, investigative sources here said. Mr. Rowe was quoted as telling the two men: "There's been a bombing. The niggers are rioting. I shot some niggers."

However, the assault on the taxicab described by Mr. Rowe more closely matches an incident that took place on Sept. 4, after the bombings of the A. G. Gaston Motel and the home of the Rev. A. D. King, brother of the Rev. Dr. Martin Luther King Jr.

On that night, Mr. Rowe has told state investigators, he was riding with Birmingham policemen in the riot area when they came upon a taxicab whose driver and a woman passenger were under assault by rioters.

Chicago Tribune

BIRMINGHAM, Ala. [UPI]—A lawyer who defended three Ku Klux Klan members 10 years ago says an ex-FBI informer was involved with his clients in an attack resulting in the murder of civil rights worker Mrs. Viola Liuzzo.

"It was Gary Thomas Rowe who suggested the trip to Lowndes County to kill some of the civil rights workers," said Haynes, a former FBI agent and former Birmingham mayor.

"And we have him on record as saying in the courtroom that he had his gun out the window and was shooting along with the rest of them," he said.

UNITED STATES GOVERNMENT

Memorandum

TO : DIRECTOR, FBI (100-448006)

DATE: 11/29/68

FROM : SAC, LOS ANGELES (157-1751) (P)

SUBJECT: COUNTERINTELLIGENCE PROGRAM
BLACK NATIONALIST - HATE GROUPS
RACIAL INTELLIGENCE

Re Los Angeles letter to Bureau dated 9/25/68.

I. OPERATIONS UNDER CONSIDERATION

The Los Angeles Office is currently preparing an anonymous letter for Bureau approval which will be sent to the Los Angeles Black Panther Party (BPP) supposedly from a member of the "US" organization in which it will be stated that the youth group of the "US" organization is aware of the BPP "contract" to kill RON KARENGA, leader of "US", and they, "US" members, in retaliation, have made plans to ambush leaders of the BPP in Los Angeles.

It is hoped this counterintelligence measure will result in an "US" and BPP vendetta.

Investigation has indicated that the Peace and Freedom Party (PFP) has been furnishing the BPP with financial assistance. An anonymous letter is being prepared for Bureau approval to be sent to a leader of PFP in which it is set forth that the BPP has made statements in closed meetings that when the armed rebellion comes the whites in the PFP will be lined up against the wall with the rest of the whites.

It is felt that this type of a letter could cause considerable disruption of the association between the BPP and the PFP.

In order to cause disruption between the BPP of Oakland, California, and the BPP of Los Angeles, an envelope is being prepared for Bureau approval which appears

SAC, SAN DIEGO [redacted]

COUNTERINTELLIGENCE PROGRAM
BLACK NATIONALIST - HATE GROUPS
RACIAL INTELLIGENCE
(BPP)

III. TANGIBLE RESULTS

The BPP Breakfast Program appears to be floundering in San Diego due to lack of public support and unfavorable publicity concerning it. It is noted that it has presently been temporarily suspended. Therefore, it was felt that placing the above mentioned anonymous call to the Bishop at this particular time might be a significant factor in precluding the resumption of the program. The information to the Bishop appeared to be favorably received and he seemed to be quite concerned over the fact that one of his Priests was deeply involved in utilization of church facilities for this purpose. This matter, of course, will be closely followed for further anticipated developments concerning the Breakfast Program.

Shootings, beatings, and a high degree of unrest continues to prevail in the ghetto area of southeast San Diego. Although no specific counterintelligence action can be credited with contributing to this over-all situation, it is felt that a substantial amount of the unrest is directly attributable to this program.

In view of the recent killing of BPP member SYLVESTER BELL, a new cartoon is being considered in the hopes that it will assist in the continuance of the rift between BPP and US. This cartoon, or series of cartoons, will be similar in nature to those formerly approved by the Bureau and will be forwarded to the Bureau for evaluation and approval immediately upon their completion.

IV. DEVELOPMENTS OF COUNTERINTELLIGENCE INTEREST

Due to the fact that the US members violently objected to being called "pork chops", a change in the order of the mailing of the cartoons was made in San Diego. One of the recently Bureau-approved cartoons depicting [redacted] holding a Black Panther off with his hand with the title "Pork Chop Karenga" was distributed on 4/7/69, due to the excellent timely release of this particular cartoon.

UNITED STATES GOVERNMENT

Memorandum

#11

TO : DIRECTOR, FBI

DATE: 1/13/69

FROM : SAC, CHICAGO

SUBJECT: COUNTERINTELLIGENCE PROGRAM
BLACK NATIONALIST - HATE GROUPS
RACIAL INTELLIGENCE
(BLACK PANTHER PARTY) (BPP)

DO NOT REMOVE

In the Chicago letter of December 16, 1968, a suggestion was made that an anonymous mailing be sent JEFF FORT, leader of the Blackstone Rangers, advising of BPP efforts to discredit him, and in effect to "take over" the Rangers. As events have subsequently developed, as set forth in referenced Chicago airtel and LHM, the Rangers and the BPP have not only not been able to form any alliance, but enmity and distrust have arisen, to the point where each have been ordered to stay out of the others territory. The BPP has since decided to conduct no activity or attempt to do any recruiting in Ranger territory.

It appears therefore that the letter as originally intended at this point would serve no useful purpose. The end in view appears to have been very quickly arrived at, in great measure by virtue of the inherent inability of two such volatile and power conscious groups to derogate any of their status or assumed authority to the other.

From information recently received, it appears, however that the BPP has not entirely abandoned all hope of utilizing the Rangers for their own purposes. Some feeling has been evident that FORT may not continue indefinitely in his position of leadership with the Rangers, most probably a reference to various criminal charges facing him. It is clear, however, that so long as he is in this position, any working arrangement between the two groups will be on Ranger terms.

JCS/vrg

ATTORNEY'S COPY

Consequently, Chicago now recommends the following letter be sent FORT, handwritten, on plain paper:

"Brother Jeff

"I've spent some time with some Panther friends on the west side lately and I know what's been going on. The brothers that run the Panthers blame you for blocking their thing and there's supposed to be a hit out for you. I'm not a Panther, or a Ranger, just black. From what I see these Panthers are out for themselves not black people. I think you ought to know what their up to, I know what I'd do if I was you. You might hear from me again."

"A black brother you don't know"

The above would be sent to FORT in care of the First Presbyterian Church, 6401 South Kimbark, the widely publicized headquarters of the Rangers.

It is believed the above may intensify the degree of animosity between the two groups and occasion FORT to take retaliatory action which could disrupt the BPP or lead to reprisals against its leadership.

Consideration has been given to a similar letter to the BPP, alleging a Ranger plot against the BPP leadership however, it is not felt this would be productive, principally since the BPP at present is not believed as violence-prone as the Rangers, to whom violent type activity, shooting, and the like, are second nature. There is also the possibility that if a future contact between the two were to take place, and it became apparent that both had received such communications, then an outside interest would be somewhat obvious.

Chicago will take no action regarding the above, pending Bureau authorization.

42

CHICAGO SUN-TIMES, Thurs., Feb. 12, 1976

Bob Greene

Laundered box score?

No hits, no guns, no terror

We appear to have a new definition for a time-honored Chicago term.

Marlin W. Johnson, former head of the Chicago FBI office, testified in federal court this week, and he was asked to define the words "a hit."

The reason Johnson was asked to do this was that Jeff Fort, the leader of a Chicago street gang, received a letter back in 1969 that said, "there is supposed to be a hit out for you."

The letter was intended to convince Fort that the "hit" was being ordered by members of the Black Panther Party. Recently uncovered evidence, however, has indicated that the letter was written not by Black Panthers — but by FBI agents, in an effort to turn black nationalist groups against each other.

SO JOHNSON WAS on the stand to testify about the FBI's role in the sending of the letter to Fort. Johnson admitted that he had once approved the mailing of the letter. But he denied that Fort should have construed the phrase, "there is supposed to be a hit out for you," to mean that Fort was in danger of foul play.

Johnson said that "a hit" — according to newspaper accounts of his testimony — was "something nonviolent in nature."

Now I may not have been raised in the big city, but I grew up watching The Untouchables on television just like everyone else, and I was pretty sure that "a hit" did not precisely mean "something nonviolent in nature."

Still, I didn't want to trust myself on this. So I went to a reference book call "The Dictionary of American Underworld Lingo" (Citadel Press, New York, 1962) and looked up the definition. It was brief and to the point:

"HIT — To shoot to kill."

Marlin Johnson had been a top FBI man, though, and I didn't want to rely on the say-so of one not very well-known book to call him wrong. So I got on the telephone and sought the advice of a number of experts in the field. I asked each of them, "Does a 'hit' mean something nonviolent in nature?" Here are their responses:

PETER MAAS, author of "Serpico" and "The Valachi Papers" — A hit means only one thing. It means a bullet in the back of the head. Nonviolent? Jesus Christ. Joe Valachi talked about 33 hits to me, and he wasn't referring to Broadway plays."

STEVE SCHILLER, executive director of the Chicago Crime Commission — "A hit means something very violent. A hit means being taken care of completely. A hit means somebody being exterminated. Taken out. Murdered. Killed. Dead. Final."

JAY ROBERT NASH, veteran crime-watcher and author of "Bloodletters and Bad Men"—"A hit has only one meaning, and that's assassination. That's all it is: planned, ordered-in-advance murder. Usually the weapon is a handgun. Often a silencer is used."

TONY PELLICANO, private eye—"A hit means that a contract is out. A hit means you're going to die. A hit means that your life has been offered up for sale by whoever wants to get you. It's not a very difficult concept. If there's a hit out on you, that simply means that someone has been hired to kill you."

GEORGE V. HIGGINS, former federal prosecutor in Boston and author of "The Friends of Eddie Coyle"—"What did you say? A hit is 'something nonviolent in nature'? That's a lot of crap. It was never like that in any parlance I ever heard. A hit has always meant one thing. It's a contract for murder. There's no two ways about it. It's murder."

RONALD EWERT, acting executive director of the Illinois Legislative Investigative Commission (formerly the Illinois Crime Commission)—"A hit's a hit. A guy's going to get killed. When someone says that there is a hit out for you, he means that the plans are for you to be dead soon."

So . . . I am certainly not going to quarrel with G-Man Johnson's definition of "a hit." In fact, I kind of like it. It adds yet another note of distinction to our civic history:

Only in Chicago can premeditated murder be defined as a nonviolent act.

Attached is a detail of the address at 2337 West Monroe Street, first floor apartment, as furnished by WILLIAM ONEAL on November 19, 1969, which information was orally furnished to the Chicago Police Department and Illinois State Attorney's Office:

AIRTEL

TO: DIRECTOR, FBI [redacted]

FROM: SAC, CHICAGO [redacted]

SUBJECT: [redacted]

Re Bureau airtel 12/8/69 and Chicago letter 11/24/69.

Information set forth in Chicago letter and letterhead memorandum of 11/21/69, reflects legally purchased firearms in the possession of the Black Panther Party (BPP) were stored at 2337 West Monroe Street, Chicago. A detailed inventory of the weapons and also a detailed floor plan of the apartment were furnished to local authorities. In addition, the identities of BPP members utilizing the apartment at the above address were furnished. This information was not available from any other source and subsequently proved to be of tremendous value in that it subsequently saved injury and possible death to police officers participating in a raid at the address on the morning of 12/4/69. The raid was based on the information furnished by informant. During the resistance by the BPP members at the time of the raid, the Chairman of the Illinois Chapter, BPP, FRED HAMPTON, was killed and a BPP leader from Peoria, Illinois, was also killed. A quantity of weapons and ammunition were recovered.

It is felt that this information is of considerable value in consideration of a special payment for informant requested in re Chicago letter.

FBI memo on Panthers bared

Charge FBI 'plot' to risk police lives

By Thomas J. Dolan/CST 1/17/76

Lawyers for families of two slain Black anther Party leaders Friday subpenaed FBI ocuments they say outlined an FBI plan to sk the lives of local police in clashes and ids involving Panthers.

"We have a reliable informant," said attorey G. Flint Taylor, "who has told us that ch a plan existed and he saw it in writing. e are demanding that those documents be ought into court."

Taylor made his comment after serving bpenas on four Federal Bureau of Instigation agents, or former agents, three of om are facing civil charges that they vioed the civil rights of Panther leaders Fred mpton and Mark Clark during a Dec. 4, 9, weapons raid on a West Side Panther artment. Hampton and Clark were killed in raid.

The subpenas demand all documents showan alleged FBI counterintelligence plan to or entice local law enforcement agencies neutralize the Black Panther Party. The penas said the plan:

". . . set (s) forth that local law enforcement agencies (are) to be employed by the FBI to raid Black Panther Party offices and homes wherein Panthers and police would be wounded and killed and Panthers arrested . . ."

The plan, according to the subpena, was drafted between January, 1963, and December, 1970. Sources close to the case said the existence of the plan has been made known to a U.S. Senate committee investigating the Hampton and Clark case, but Senate officials could not be reached for comment.

Sources close to the Hampton and Clark lawyers said the plan is being sought to show that the FBI intended that police should be killed or wounded in clashes with armed Panthers to publicly discredit the militant blacks.

Subpenaed were Marlin Johnson, former special agent in charge of the Chicago FBI office, and agents Roy Mitchell and Robert Piper. All are charged in the $47.7-million federal civil rights damages suit being tried before U.S. District Court Judge Joseph Sam Perry.

Panther raid 'success'--agent

4/30/76 Chicago Sun Times

y Dennis D. Fisher

FBI agent testified rsday that he considered police weapons raid on a ago Black Panther apart- t "successful" because no e were injured.

bert T. Piper, head of the s Chicago "racial matters d" at the time of the pre- raid Dec. 4, 1969, told a jury and U.S. District t Senior Judge Joseph Perry that information lied to local police by the was the key to the success e weapons search.

er, a defendant in a $47.7- on civil rights damage filed by the families of ton and Clark and other ants of the apartment, uestioned about a letter he wrote to FBI headquarters in Washington.

The one-page letter credited FBI undercover informant William M. O'Neal Jr. with providing a list of weapons and a detailed floor plan of the Panther apartment, including the exact location of Hampton's bed, which contributed to the saving of police lives. The letter was read to the six-member jury.

"It is felt that this information (O'Neal's) is of considerable value in consideration of a special payment for informant . . . ," the letter said. The local FBI office was seeking a $300 "reward" payment for O'Neal, who acted as the Chicago Panther's chief of security and sometimes as a per-

Piper conceded that he wrote the letter to obtain a bonus for O'Neal.

The raiding party had been supplied the apartment diagram by another FBI agent, Roy M. Mitchell, who was O'Neal's "operator."

(Panther leaders Fred Hampton and Mark Clark were shot and killed by Chicago police assigned to the state's attorney's office, who conducted the weapons search at 2337 W. Monroe.)

CST 2/28/76

By Dennis D. Fisher

A document that showed the FBI knew of an impending police action against a Chicago Black Panther apartment surfaced Friday in federal court.

The document was a bureau report initialed by Marlin W. Johnson, chief of the Federal Bureau of Investigation office here at the time.

Chicago police officers conducted a raid on the Panther apartment Dec. 4, 1969, the day after the FBI report was dated.

Johnson, now an executive with the Canteen Corp. and chairman of the Chicago Police Board, has testified that the first he heard of the weapons raid on the apartment was on radio the morning it happened.

In earlier testimony Johnson denied any knowledge that Chicago policemen assigned to the Cook County state's attorney's office planned the predawn raid in which Panther leader Fred Hampton and member Mark Clark were killed.

The FBI report was read to a jury and U.S. District Court Judge Joseph Sam Perry. The report dealt with an FBI counterintelligence program aimed at harassing and neutralizing "black nationalist-hate groups" that included the Black Panther Party.

Dated Dec. 3, 1969, the three-page report noted that the Chicago FBI office has "continued to advise local authorities of instances where BPP members appear vulnerable to arrest on local charges."

The report recites how the FBI gave information concerning weapons "reportedly purchased legally by local BPP members. This information has been furnished to local law-enforcement officials. Officials of the Chicago Police Department have advised (the FBI) that the department is currently planning a positive course of action relative to this (weapons) information."

Sun-Times Bureau 5-9-76

WASHINGTON — A Federal Bureau of Investigation memo says the 1969 raid in which two Black Panthers were killed in Chicago was "based on information" from an FBI informer, a Senate intelligence committee staff report disclosed Thursday.

Arthur Jefferson, head of the staff that produced the report, said the memo was "inconsist-

by former Cook County State's Atty. Edward V. Hanrahan, Chicago police and the FBI.

Jefferson said the Chicago raid was part of a nationwide FBI effort to "encourage police to raid the Panthers." The FBI justified the policy as a precaution against violence, he said, but "the real reason was they didn't like the political rhetoric and the political stance the Black Panther Par-

Explosives offer to Panthers told

CDN 7/2/76

By Rob Warden

A paid FBI informant offered explosives to members of the Black Panther Party here in 1969 and suggested they could blast their way into armories to seize weapons, according to a sworn statement filed Thursday in federal court.

The statement details testimony that former Panther Louis Truelock would give if he were permitted to testify in a landmark civil rights suit before U.S. District Court Judge Joseph Sam Perry.

Truelock would testify that in October, 1969, he and other Panthers went with FBI informant William O'Neal Jr. to the home of O'Neal's father on the West Side, the statement said.

THERE, ACCORDING TO THE statement, O'Neal showed the Panthers a satchel of putty, blasting caps and several plastic bottles of liquid, presumably high explosives.

"He said armories could be blown up this way and we could get their guns," Truelock's statement said.

The next month, the statement continued, Truelock and other Panthers again went to O'Neal's father's home, near 14th and Springfield.

"O'Neal showed us the explosives again and said there was a McDonald's we would rip off," Truelock was quoted as saying. "He (O'Neal) stated we could use the explosives on the safe door and blow it open."

The statement also said that O'Neal once tried to bring an apparently stolen electric typewriter into Panther headquarters at 2350 W. Madison.

Tell torture by FBI spy

Chicago Daily Defender 7/21/76

By ROBERT McCLORY

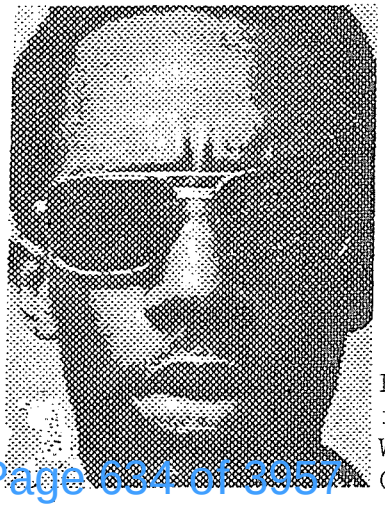
William O'Neal, the Black Panther double agent who helped arrange the 1969 raid on Fred Hampton's apartment, also had plans to blow up City Hall with a bomb carried in a radio-controlled model airplane, a witness testified this week before U.S. District Judge Joseph Sam Perry.

Ronald (Doc) Satchel, who was shot five times during the raid, said O'Neal's elaborate devices, including the plane and a home-made electric chair he built to "punish traitors," led the Panther high command in early 1969 to suspect him of being an agent provocateur. They voted to strip O'Neal of his position as chief of security, said Satchel, but decided not to oust him from the party — a decision which was eventually fatal for Hampton and Mark Clark.

Throughout 1969 O'Neal continued to feed the FBI with information about Panther weapons and security measures, finally triggering the Dec. 4 raid.

During his questioning of Satchel, Atty. James Montgomery, representing survivors of the raid, attempted to establish that much of O'Neal's information was blatantly false. Over the strenuous objections of attorneys representing O'Neal, Edward Hanrahan and 27 other men implicated, Montgomery asked Satchel about a report submitted in late 1968 by O'Neal's FBI contact, Roy Mitchell. In it, O'Neal claimed Panther headquarters at 2350 W. Madison were then equipped with devices to "electrocute unwanted intruders instantly" and to eject poison gas that "kills in a matter of seconds." O'Neal also told Mitchell that a bullet-proof steel door was in place and the windows were equipped with siren-alarms.

In fact, testified Satchel who frequented Panther headquarters daily, he never saw any of these devices. The airplane and the electric chair were real, however. Satchel said the Panthers never took seriously O'Neal's claim that the one-foot-long, plastic airplane equipped with a gasoline motor could actually blow up City Hall, and he never saw it in operation. Hampton, he said, explicitly ordered O'Neal to dismantle the electric chair after it has been constructed.



FBI informer William O'Neal

CDD 3/5/77

William O'Neal, the central figure in the Black Panther trial, engaged in terrorism, torture, robbery and theft, while he was collecting thousands of dollars from his FBI employers, a witness testified this week in the continuing federal trial.

Robert Bruce, 29, a former Panther himself, described many of O'Neal's peculiar projects, including the construction of a Panther electric chair to execute "traitors" and the designing of a radio-controlled model airplane to bomb City Hall. He also said O'Neal encouraged Panther members to commit crimes, personally took part in several burglaries and holdups, and viciously beat one suspected informant with a bullwhip.

The prosecution contends O'Neal was encouraged by his FBI superiors to discredit the party and justify the fatal raid.

Bruce, who was moved by the FBI to California three years ago following his testimony in the Stanley Robinson trial, said O'Neal contacted him last year and urged him not to appear in the Panther trial.

Charge FBI informer was 'hit man

By William J. Eaton
Of Our Washington Bureau

WASHINGTON — An FBI informer in the Black Panther Party in Chicago became part of a "murder-by-contract group" with apparent approval of FBI officials, a member of the Senate intelligence committee has charged.

The informer supplied the Panthers with weapons, trained them in their use and later joined a murder squad that stalked a victim and killed him, according to Sen. Walter D. Huddleston (D-Ky.).

Although Huddleston did not name the informer, he apparently is William O'Neal, a former FBI informer who was chief of security for the Chicago Panthers when Illinois Panther leaders Fred Hampton and Mark Clark were killed in a police raid six years ago.

O'Neal also testified for federal prosecutors in the 1973 trial of former Chicago policeman Stanley Robinson, who was convicted of murdering two persons. O'Neal testified that he accompanied Robinson when a contract killing was carried out on May 6, 1972, on the Dan Ryan Expressway.

Huddleston asked why the Chicago informer was able to provide weapons to the Panthers and associate with killers "presumably all with the knowledge of the FBI."

JOSEPH Deegan, chief of the FBI section on extremist organizations, did not challenge the senator's recital of the facts.

Chicago Daily News 12/3/75

Panther witnesses tell threat by O'Neal

Chicago Daily Defender 12/15/76

By ROBERT McCLORY

Two former Black Panthers have claimed William O'Neal warned them it would not be in their "best interests" to testify at the current federal trial.

The two, Robert Bruce and Nathaniel Junior, said they were contacted separately by O'Neal, the FBI informant who is now in his third week on the stand, and told to "forget about" unrequested visits O'Neal paid them last April. He also allegedly discouraged their scheduled appearances in the trial. As a result of these contacts, Junior and his family are reportedly in fear for their lives and are seeking to keep their present whereabouts unknown.

Bruce and Junior, former associates of O'Neal, have long criminal records, and are prepared to testify about O'Neal's own criminal history. Attorneys for the Panther plaintiffs believe their testimony would seriously discredit O'Neal's claim before the jury that he served as a paid informant only because he was "interested in law enforcement and what the FBI stood for."

Junior, in particular, has charged O'Neal with building an electric chair to scare Panther traitors, organizing groups to conduct robberies, bringing explosives and guns to Canada while Junior was a fugitive there, blowing up a car in suburban Argo, and urging other Panthers to engage in terrorist activities.

Meanwhile, O'Neal has admitted little under heavy questioning by Atty. Jeff Haas. He said his only purpose as an informant was to provide FBI agent Roy Mitchell with "general information" about Panther activities. The plaintiffs, however, are attempting to establish that O'Neal was paid by the government to act as an "agent provocateur" in the party, to encourage illegal acts and to provide justification for a crackdown on its leaders. This theory has gained considerable credibility in view of official FBI documents which urge agents to promote disruption by a host of illegal dirty tricks and the use of informers.

Fred Hampton: Gunned down at dawn by Chicago Police using information given to them by FBI informant and agent-provocateur William O'Neal.

Panther trial

New Times 2/18/77

When William O'Neal recently took the witness stand in the $47.7 million civil suit filed by survivors of the 1969 Chicago police raid, in which Black Panther leaders Fred Hampton and Mark Clark were slain; a chant of "pig, pig, pig" arose from the plaintiffs' side of the courtroom.

In 1969-70, O'Neal earned $30,000 as a paid FBI informant who so successfully infiltrated the Panthers that he became Fred Hampton's personal bodyguard. It was O'Neal who provided the FBI with a floor plan of Hampton's apartment, a plan that the 14-man police unit referred to when surprising the sleeping residents at dawn with a nine-minute spray of gunfire. An autopsy revealed abnormally high levels of barbiturates in Hampton's blood; the plaintiffs believe that O'Neal drugged Hampton the night before the raid. FBI documents in evidence show that O'Neal was rewarded for his efforts with a $300 bonus.

After three earlier "official" investigations of the raid, during which neither he nor the FBI was even mentioned, O'Neal is back on the government payroll, this time earning about $3,000 a month to testify in his own defense. (Other defendants in the case include the FBI, the Chicago police department and the Illinois State Attorney's Office.) The payments, which started in September 1975—on the day he served his deposition in the case—are for "subsistence," O'Neal says.

Though able to subsist comfortably on his government salary, O'Neal did have some uncomfortable moments during his six weeks of testimony. While being questioned about the floor plan and his request to be a pallbearer at Hampton's funeral, O'Neal disappeared during a lunch recess last December 8 and didn't turn up again for five days. The defense explained that his wife was ill, but upon returning, O'Neal failed to bring the medical note that the plaintiffs' attorneys had requested. Although the plaintiffs believe that O'Neal was really holding out for more government money, Judge Joseph Sam Perry would not permit them to question O'Neal about his absence, ruling that to do so would violate security—O'Neal's location is a well-kept government secret.

48 Chicago Tribune, Friday, June 27, 1975

Nation

Report to senators

FBI is accused of plotting terror

New York Times News Service

SAN DIEGO—The American Civil Liberties Union completed Thursday a report for Senate investigators alleging that the Federal Bureau of Investigation recruited a band of right-wing terrorists and supplied them with money and weapons to attack young antiwar demonstrators.

The 5,000-word account prepared for the Senate Select Committee in Intelligence contains what ACLU lawyers described as "newly established evidence" purportedly linking the FBI to at least two assassination plots here.

The lawyers, H. Peter Young and Mark D. Rosenbaum of the ACLU Foundation of Southern California, said the allegations to be sent, probably Friday, to the Senate committee "document in detail" the FBI's sponsorship in 1971 and 1972 of a San Diego group calling itself the "Secret Army Organization."

TOLD OF THE ACLU assertions, a spokesman for the FBI said that the bureau had had "nothing to do" with the establishment of the so-called Secret Army Organization, "nor did we have anything to do with the direction of its activities."

According to the ACLU report, the Secret Army Organization was set up "on instructions of FBI officials" to serve as agents provocateurs, inciting disorders as a means of exposing "domestic radicals," particularly campus leaders of the New Left protesting the war in Southeast Asia.

The organization was described by the ACLU as an outgrowth of an elaborate interagency espionage apparatus organized "at the direction of Richard M. Nixon" early in his administration to intimidate and silence domestic critics.

THE ACCUSATIONS contained in the report go considerably beyond those of a $10.6-million damage suit filed by ACLU attorneys in Federal District Court here last Jan. 6 on behalf of Peter G. Bohmer, a discharged economics professor at San Diego State University, and Paula Tharp, a companion.

Miss Tharp was wounded on Jan. 6, 1972, when shots were fired into Bohmer's Ocean Beach home here from an automobile carrying several members of the so-called Secret Army.

Bohmer, an avowed Marxist, and Miss Tharp, formerly employed by an underground newspaper twice wrecked in nighttime Secret Army raids, organized the San Diego Convention Coalition in mid-1971. The coalition was formed to bring thousands of youthful demonstrators to San Diego to disrupt the 1972 Republican National Convention before the convention site was shifted to Miami Beach.

THE ACLU report says that John Rasperry, whom it identified as an FBI informer, has admitted that, in the winter of 1971-1972, the bureau instructed him to assassinate Bhomer, but that the attempt was neved him to assassinate Bohmer,

Another FBI-directed plot to assassinate Bohmer was allegedly set up in April, 1972, with Gil Romero, a member of the San Diego Police Department's antisubversive "Red Squad," also described as an FBI undercover agent.

The plot was abandoned, Young reported, presumably when the Republican convention was moved to Miami Beach.

By JOHN M. CREWDSON
Special to The New York Times

WASHINGTON, Jan. 11 — Clarence M. Kelley, the director of the Federal Bureau of Investigation, denied today that his agency had played a significant role in financing or encouraging the activities of a group of right-wing San Diego terrorists known as the Secret Army Organization.

Despite Mr. Kelley's insistence today that the F.B.I. "did not sponsor, did not engage in and did not condone" any of the Secret Army Organization activities, information has been placed on the public record or gathered by the Senate Select Committee on Intelligence that shows substantial F.B.I. involvement with the San Diego groups.

Testimony on F.B.I. Funding

Howard B. Godfrey, the F.B.I. informat to whom Mr. Kelley referred, who was also one of the co-founders of the Secret Army Organization, has testified in a California court that the bureau gave him $10,000 to $20,000 worth of weapons and explosives for use by the group in addition to his $250-a-month salary as an informat.

In addition, a report by the American Civil Liberties Union, provided to the Senate committee last summer, quotes John Rasperry, a second F.B.I. informat, as alleging that bureau agents ha instructed him to kill Peter Bohmer, a San Diego economics professor and radical activist, but that he had

However, according to court testimony, members of the secret group, including Mr. Godfrey, did carry out such a murder attempt on Jan. 6, 1972, when they fired a pistol through the front window of Mr. Bohmer's San Diego home.

Mr. Godfrey said that he did not fire the pistol but that he was in an automobile with the men who did. Mr. Boehmer was unhurt, but Paula Tharp, a friend, was wounded in the elbow.

Senate committee investigators have discovered, according to sources familiar with their inquiry, that the pistol in question was later given by Mr. Godfrey to his controlling F.B.I. agent, Steven Christiansen, a member of the bureau's San Diego office.

Committee sources said that Mr. Christiansen concealed the weapon in his own home for half a year while the San Diego police searched for evidence in the Tharp shooting.

The sources said that Mr. Christiansen, who has since resigned from the bureau, was disciplined in some undescribed way by the F.B.I. for his handling of the secret group.

Part Three: Other Methods and Tactics

The FBI used over two hundred tactics against liberation and progressive groups during its counterintelligence program. A partial list includes: anonymous mailings of fictitious letters; exploiting hostility between groups; spreading malicious rumors; manipulating media; pressuring employers to fire progressive employees; engineering the cancellation of speaking engagements; arranging for local police to set-up or harass groups and their members; intimidation through frequent interviews and investigations; and having the Internal Revenue Service conduct illegal tax audits.

One tactic closely related to the illegal raids mentioned in the previous section was the use of false arrests and prosecutions. This was done either by the FBI acting alone or with the cooperation of local police and prosecutors, as well as representatives of the Justice Department. During the summer of 1967, almost the entire RAM organization in Philadelphia was falsely arrested and kept in jail through the counterintelligence efforts of the FBI and the Philadelphia Police Intelligence Unit.

Often, a contemplated result of the raid would be arrest and prosecution, whether there was any real evidence or hope of conviction. There were one hundred and thirteen arrests of BPP members in Chicago in 1969, with no more than a handful of convictions resulting. In Mississippi, in 1971, the police and the FBI raided an RNA home under very suspicious circumstances. Although he was not even in the building, RNA leader Imari Obadele was charged with conspiracy and sent to the penitentiary.

The use of FBI informers and agents-provocateur was, and is, widespread, but the FBI also attempted to spread rumors that certain respected and influential progressive leaders and group members were FBI or CIA spies. This tactic led to much divisiveness and even a potential for violence within several liberation groups.

The FBI also printed its own leaflets with false or malicious information. The FBI was very successful in using the media to discredit and slander activists and liberation struggles. Many "friendly" media sources were little more than pro bono FBI agents themselves, printing or broadcasting whatever the FBI requested. The FBI even supplied pre-written feature articles and screened television documentaries for "accuracy." Like so much of their broadly illegal political repression activities, this media manipulation continues today in a less overt form, adjustments having been necessary due to the damaging revelations exposing the FBI's illegal Cointelpro operations.

SUBJECT: COUNTERINTELLIGENCE PROGRAM
BLACK NATIONALIST - HATE GROUPS
RACIAL INTELLIGENCE

This is to recommend that the Counterintelligence Program against black extremists be continued.

The Counterintelligence Program against black extremist organizations and individuals was initiated August 25, 1967, and on March 4, 1968, it was expanded from 27 to 42 participating field divisions. The goals of this program are to prevent violence by black extremists, to prevent the growth and/or unification of extremist groups, and to prevent extremist groups from gaining respectability in the Negro community. Some of the excellent results of counterintelligence action during the past year are set out below:

To create friction between Black Panther Party (BPP) leader Eldridge Cleaver in Algiers and BPP Headquarters, a spurious letter concerning an internal dispute was sent Cleaver, who accepted it as genuine. As a result, the International Staff of the BPP was neutralized when Cleaver fired most of its members. Bureau personnel received incentive awards from the Director for this operation.

To show the criminal nature of the BPP a write-up concerning the convictions of its members was prepared and received publicity in a Robert S. Allen and John A. Goldsmith syndicated column of March 31, 1970. Previously we exposed the BPP Breakfast For Children Program in these writers' column of June 14, 1969.

Articles concerning the BPP based on information furnish a news media source in Mississippi resulted in the closing of a BPP Chapter in Cleveland, Mississippi.

Counterintelligence action against other extremist organizations has also been effective. In San Diego, California, an anonymous telephone call to the landlord of the US organization resulted in the group being evicted from its Headquarters. In Miami Florida, a television source was helped in the preparation of a program exposing the Nation of Islam. The excellent results of this program were contained in a memorandum from G. C. Moore to Mr. William Sullivan, October 21, 1969, on which the Director noted "Excellent."

CONTINUED - OVER

25 JUN 5 1970

Memorandum to Mr. W. C. Sullivan
Re: COUNTERINTELLIGENCE PROGRAM
BLACK NATIONALIST - HATE GROUPS
100-448006

Counterintelligence action has also been effective against individual black extremists. In St. Louis, the circulation of a spurious newsletter caused four extremists to begin fighting among themselves. An anonymous letter to a radio station caused the removal of [redacted] from the show where he had been preaching black extremist philosophy. The Jackson Division prepared a spurious letter from a college group to a black extremist who was attempting to recruit the group. As a result, the extremist left the area, severing all contact with the group.

ACTION:

In view of the tangible results evidenced by this program with a minimum expenditure of manpower, it is recommended the Counterintelligence Program be continued.

UNITED STATES GOVERNMENT

Memorandum

TO : Director, FBI

DATE: 8/30/67

FROM : SAC, Philadelphia (157-2371)

SUBJECT: COUNTERINTELLIGENCE PROGRAM
BLACK NATIONALIST - HATE GROUPS
INTERNAL SECURITY

Re Bureau airtel to Albany dated 8/25/67.

The following suggestions are presented for general consideration:

I. RAM

This division during the summer of 1967 has had the opportunity to observe an attempt by an extremist Negro group (RAM) to affect the peace of a city. Some of the steps taken against RAM may be of possible use elsewhere under the current program. It is pointed out that in a fast moving series of situations, the police may have to "play it by ear," which may reduce Bureau control of the action taken. Actions herein set out were carried out by either the Intelligence Unit or the Civil Disobedience Unit (CDU) of the Philadelphia PD, the largest role being played by CDU.

In September 1966, [redacted] of RAM returned to his native city, Philadelphia, [redacted] that he was going underground to "cool it" and to throw off any police attention. He settled in the heart of the Negro ghetto with his common-law wife and two children.

Heads of the Intelligence Unit

This tactic worked. The police had forgotten [redacted] and had no prior experience with or knowledge of RAM. The SA contacting the Intelligence Unit secured spot check coverage of [redacted] by Negro officers as a personal favor after explaining RAM and [redacted] position in it to police officials.

INTSEC

Buy U.S. Savings Bonds Regularly on the Payroll Savings Plan

PH 157-2371

When activity started with the appearance of known Negro extremists native to Philadelphia at the [redacted] residence, a full-time surveillance by police went into effect. Police disruptive action was also initiated.

Cars stopping at [redacted] residence were checked as to license numbers. When they left the residence area they were subject to car stops by uniformed police. The occupants were identified. They then became the target for harassment. As an example, the following case is cited:

[redacted] He was located passing out RAM literature at a local school. He was interrogated. He was arrested as a narcotic user on the basis of alleged needle marks. He was fingerprinted and photographed. He was subsequently released by a magistrate.

Any excuse for arrest was promptly implemented by arrest. Any possibility of neutralizing a RAM activist was exercised.

[redacted] was arrested for defacing private property when he painted "Black Guard" on a private building. His companion was also arrested. A charge of carrying a concealed deadly weapon, aswitch-blade knife, was pushed against the companion. His probation officer was contacted, his parole revoked, and he was returned to prison for several years.

When surveillance reflected the arrival of a new group in town, they were brought in for investigation and their residence searched.

Certain addresses used by [redacted] as mail drops in Philadelphia had been determined to be the addresses of known Negro extremists. When a young Negro was arrested for passing out RAM printed flyers and was charged with inciting to riot these addresses appeared in his statements to the police. Search warrants were secured. While the search of the first four only eliminated their use as mail drops, the fifth contained RAM and Communist literature and a duplicating machine with a RAM leaflet on the plate. Three persons were arrested at this last address.

Legal searches of the home of [redacted] and other RAM members produced a volume of literature of such a nature that the District Attorney authorized the arrest of [redacted] and five other RAM members. They are still in prison.

Other RAM people were arrested and released on bail, but were re-arrested several times until they could no longer make bail.

The above local actions appear for the present to have curtailed the activities of this [redacted] group. It was apparently a highly frustrating experience for the persons involved.

[redacted] was advised that he was again under arrest and that his wife and sister were also under arrest, he lay down on the floor of his residence, beat the floor with his fists and cried.

[redacted] has been returned to New York to answer charges growing out of a RAM plot in that city to kill moderate civil rights leaders. Most of the RAM activists are still in jail in Philadelphia at this time.

The above action by local police units is cited as an example of an effective disruptive counterintelligence technique. In other cities where close police cooperation exists, it may be possible to suggest similar operations and to supply to police officers interested in such a violence-prone organization not only information concerning it but ideas relative to its vital or weak sections and profitable points of attack.

III. Future Action Planned by Philadelphia

1. Pursuant to Bureau instructions, this office will commence interviewing RAM members. About a dozen are presently incarcerated in Philadelphia and these will be the first interviewed.

2. Philadelphia is presently reviewing and analysing a list of names and addresses compiled from three private address books taken from [redacted] at the times of his three arrests since he returned to Philadelphia. Selective interviews will be made and the analysis may lead to other counterintelligence suggestions.

3. [redacted] and most RAM activists in Philadelphia appear to be in prison. Philadelphia will have to evaluate the situation more fully to determine the extent of vitality remaining in RAM in this area before it will be in a position to advance further suggestions under this program.

THE NEW YORK TIMES, THURSDAY, MARCH 13, 1975

Security Aide for Indians Says He Was F.B.I. Informer

By JOHN KIFNER
Special to The New York Times

CHICAGO, March 12—The American Indian Movement's chief security officer during the trial of the leaders of the Wounded Knee take-over said today that he was a paid informer for the Federal Bureau of Investigation.

The Government, in a sworn affidavit at the trial, had appeared to contend that it had no informer in the defense ranks.

The informer, Douglass Durham, was the chief aide and confidante of Dennis J. Banks, one of the two defendants and a co-leader of the American Indian Movement. In addition to being the organization's national security director, he became, in effect, its chief bureaucrat.

"I exercised so much control that you couldn't see Dennis or Russell [Means, the other defendant and co-leader] without going through me, you couldn't contact any other chapter without going through me, you couldn't contact any other chapter, without going through me, and if you wanted money you had to see me," Mr. Durham said.

Cash Payments Raised

During the trial, Mr. Durham was the only person, other than defendants and lawyers, with regular access to the room in which defense strategy was planned. He said that his proximity to the A.I.M. leadership had caused his cash payments from the F.B.I. to be raised from $900 a month to $1,100.

He said he was given a special telephone number during the trial, which was held in St. Paul, to call a three-man F.B.I. team headed by Ray Williams.

Reached at the Minneapolis office of the F.B.I., Special Agent Ray Williams said, "We are unable to comment on that."

Following the 71-day occupation of the village of Wounded Knee on the Oglala Sioux reservation of Pine Ridge in South Dakota by more than 200 Indian militants in the late winter and early spring of 1973, Mr. Means and Mr. Banks were indicted on Federal charges of conspiracy, larceny and assault on government officers.

Charges Dismissed

The charges were dismissed after an eight-and-a-half-month trial last Sept. 17 by Judge Frederick J. Nichol of Federal District Court when a juror became sick and the Government declined to proceed with a jury of 11. A Government appeal on the case was argued yesterday in St. Louis.

In dismissing the charges, Judge Nichol assailed the prosecution, contending that it had deliberately deceived the court. He was particularly critical of the F.B.I., whose agents, he said, had given testimony that was not true, and had withheld documents or furnished altered documents to defense attorneys.

"It's hard for me to believe that the F.B.I., which I have revered for so long, has stooped so low," the judge said.

In an interview last night, the 37-year-old Mr. Durham described what he said ware his activities as an F.B.I. informer.

His cover was broken on Friday, he said, when, after some members of the group became suspicious, he was confronted with law enforcement documents that proved his role as an informer.

He said he was "relieved" because he had come to respect Mr. Banks and to believe that A.I.M. was a "legal, social organization that wasn't doing anything wrong."

Mr. Durham, a large man with his black, shoulder-length hair, recounted his career as a police undercover agent in his native city of Des Moines, Iowa.

He said that after serving in the Marine Corps, he joined the Des Moines police force, working in a burglar-infested neighborhood, but left the force after his wife died.

He later worked in and thsn managed a series of restaurants, some of which became hangouts for burglars, Mr. Durham said.

At the same time, he added, he was learning to fly a plane and to scuba dive, and was developing skills as a photographer, studying locks and burglar tools and reading about psychology—all abilities that would eventually serve him as an informer.

He said that he began passing the information to the F.B.I. and the local police, and eventually became a police undercover operative on criminal cases in several Midwestern cities.

He said he was taking photographs for an underground paper called Pax, whose editor asked him to go to Wounded Knee during the Indian take-over.

Reporting this to the F.B.I., he entered the encampment with press credentials, took photographs and gave a report on the Indian group's defenses.

After returning to Des Moines, he said, the F.B.I. suggested that he get in touch with Harvey Major, the leader of the local A.I.M. chapter. Mr. Durham became the publicity officer and later the assistant director of the chapter.

Mr. Durham's swarthy skin, dark eyes, and high cheekbones gives him an Indian look, and appearance heightened by the large turquoise ring and beaded belt buckle he wears and by the headband he wore around his hair when he was the Indian group's chief security officer. He told the A.I.N. members that he was one-fourth Chippewa.

At one point, he said he helped lead an armed take-over of the Grimes State Office Building in Des Moines. He said he first informed the state police of the impending take-over, and that they paid a $100 fine he received for disturbing the peace.

It was his skill as a pilot that first brought him close to Mr. Banks, he said, and the F.B.I. encouraged him to maintain the relationship.

Mr. Banks had gone into hidding in Canada after the indictment and before the bond was raised. He got a message to Mr. Durham to meet him in Yellow Knife, in the Northwest Territories. Mr. Durham did, and Mr. Banks gave him two rolls of movie film that Mr. Durham turned over to the F.B.I.

Then, with the F.B.I.'s knowledge, Mr. Durham again flew to Canada in a rented plane and spirited Mr. Banks to Rapid City, S.D., in time to avoid forfeiting bond on state charges.

Later, Mr. Durham said that he flew Mr. Banks around the country on speaking trips and that at one point the F.B.I. gave him a $1,000 "bonus," made out to the charter service, to pay for the plane.

OFFICE OF THE DIRECTOR FEDERAL BUREAU OF INVESTIGATION MAR 16 1973

As of March 13, 1973, available information indicates an estimated 350 to 400 individuals are at Wounded Knee, Pine Ridge Indian Reservation, South Dakota, taking part in the occupation of that community under the leadership of the American Indian Movement. Previous estimates of the number of individuals at Wounded Knee have ranged as high as 1,000, many of whom are reportedly armed with assorted weapons, including automatic rifles and machine guns. The exact number of individuals at

COUNTERINTELLIGENCE PROGRAM
BLACK NATIONALIST - HATE GROUPS
BLACK PANTHER PARTY (BPP)
RACIAL MATTERS

Rebuairtel 8/27/70 and San Francisco airtel 9/8/70, copies furnished all recipients.

Bureau concurs with observations of San Francisco concerning proposals submitted by Baltimore, New Haven, and Washington Field. In event these offices have specific proposals to make in line therewith, they should be separately submitted in detail requesting specific Bureau authority to implement them.

MAILED 8 COMM-FBI

Concerning the first proposal submitted by Detroit, counterintelligence action by San Francisco to capitalize on Huey P. Newton's favorable stand toward homosexuals has already been authorized by the Bureau. The second Detroit proposal to consider directing an anonymous communication to Newton accusing David Hilliard of stealing BPP funds and depositing them in foreign banks does have merit and the Bureau does not concur with San Francisco's observation that this would have little effect since there is no record that Hilliard is skimming large amounts of money. Purpose of counterintelligence action is to disrupt BPP and it is immaterial whether facts exist to

1 - 105-165706 (BPP)

SEE NOTE PAGE THREE

100-448006

substantiate the charge. If facts are present, it aids in the success of the proposal but the Bureau feels that the skimming of money is such a sensitive issue that disruption can be accomplished without facts to back it up.

Accordingly, Detroit immediately furnish Bureau and San Francisco with specific suggestions and wording to this effect and San Francisco should then review same and submit specific proposal in this regard for approval by Bureau.

With respect to two anonymous letters proposed by Los Angeles, Bureau concurs with San Francisco that to include the card of a member of a rival black extremist group in a letter to Hilliard indicating Newton is marked for assassination could place the Bureau in the position of aiding or initiating a murder by the BPP. Accordingly, Los Angeles' proposal identified as "letter A" is not approved. Los Angeles should reword this letter to convey the same thought without directly indicating that it is from a specific member of a rival group. The letter could imply that the writer would soon get in touch with Hilliard to see what he would pay to have Newton eliminated. Resubmit the revised letter to the Bureau for approval.

Concerning the second anonymous letter identified as "letter B" submitted by Los Angeles to be directed to Newton apparently from dissident and expelled Los Angeles BPP members and aimed at undercutting previous leadership, this proposal is authorized. Los Angeles mail same in such a manner that it cannot be traced to the Bureau. Advise Bureau and San Francisco when mailed and of any positive results.

TO : DIRECTOR, FBI (100-448006) DATE: 7/9/68

WFO inclined to feel the best way to implement the suggested counter-intelligence program against CARMICHAEL is by inaugurating a "whispering campaign" that he is an agent of the U. S. Government and doing organizing work among Negroes solely for the purpose of helping the government identify racial militants and future racial radicals. Further,

TO : DIRECTOR, FBI (100-448006) DATE: 7/10/68

FROM : SAC, NEW YORK (100-161140) (P)

It is suggested that consideration be given to convey the impression that CARMICHAEL is a CIA informant.

One method of accomplishing the above would be to have a carbon copy of informant report reportedly written by CARMICHAEL to the CIA carefully deposited in the automobile of a close Black Nationalist friend. The report should be so placed that it will be readily seen.

It is hoped that when the informant report is read it will help promote distrust between CARMICHAEL and the Black Community. It is suggested that carbon copy of report be used to indicate that CARMICHAEL turned original copy into CIA and kept carbon copy for himself.

It is also suggested that we inform a certain percentage of reliable criminal and racial informants that "we heard from reliable sources that CARMICHAEL is a CIA agent". It is hoped that these informants would spread the rumor in various large Negro communities across the land.

TO : DIRECTOR, FBI (100-448006) DATE: 9/9/68

On 9/4/68, a pretext phone call was placed to the residence of STOKELY CARMICHAEL and in the absence of CARMICHAEL his mother was told that a friend was calling who was fearful of the future safety of her son. It was explained to Mrs. CARMICHAEL the absolute necessity for CARMICHAEL to "hide out" inasmuch as several BPP members were out to kill him, and it would probably be done sometime this week. Mrs. CARMICHAEL appeared shocked upon hearing the news and stated she would tell STOKELY when he came home.

UNITED STATES GOVERNMENT

Memorandum

59

TO : DIRECTOR, FBI (100-448006)

DATE: 12/2/68

FROM : SAC, SAN FRANCISCO (157-601) - P

SUBJECT: COUNTERINTELLIGENCE PROGRAM
BLACK NATIONALIST - HATE GROUPS
RACIAL INTELLIGENCE
(BLACK PANTHER PARTY)

Re Bulet 11/25/68.

On 11/19/68, a group of members of the BPP held up a service station in San Francisco and then, when stopped by the San Francisco Police Department, engaged in a shooting fray, in which three police officers were wounded. Participating prominently were two local [redacted] of the BPP, [redacted]. Only [redacted] was armed and did all the shooting, which took place close to Police Headquarters. The truck in which the Panthers were riding was clearly marked as a BPP vehicle. ELDRIDGE CLEAVER was reported in the press as being astounded at such an episode, with so little chance of success, and which received very bad publicity for the BPP. It was so illogical, he charged, that there must have been a police plant in the truck, and suspicion centered on [redacted] because he was the man in charge; likewise he had gone "to the men's room" during the holdup, and the BPP suspected he may have gone to phone the police.

[redacted] In order to help this idea, the San Francisco Office arranged through the SFPD to give [redacted] special privileges at City Prison, such as more lenient visiting hours, and to have the guards show him "extra" courtesy in front of other prisoners. Also, with Bureau concurrence, an anonymous letter was sent to BPP Headquarters via Omaha, where [redacted] was in August, 1968, organizing a new BPP branch, and where he had been temporarily detained and interviewed by police, suggesting

60

[redacted]

SF 157-601
WaC/jr

that the brothers in Omaha were suspicious of [redacted], who had easily gotten out of jail on a local charge.

The success of this operation is unknown, however, it is certain to have added to the suspicions of the BPP toward [redacted] who is actually an important man in the San Francisco BPP.

The San Francisco Office wishes to point out that opportunities such as the above are rare, and fast action is necessary to successfully implement them. It cannot be expected that a planned disruption in the average case would be of such probable value.

It is believed that the BPP is becoming sensitive to the possibility of informers. This office will try to ascertain those Panthers who have been arrested and who the BPP thinks might start to talk. We would then formulate some plan to cast suspicion on the man. We must bear in mind that if the plan is successful, a gang-type murder may be the result.

Recently, the San Francisco Office ascertained that ELDRIDGE CLEAVER was "dating" teenage girls and neglecting his wife, the dynamic and handsome KATHLEEN CLEAVER. With Bureau permission, the dating information was made available to Mrs. CLEAVER. Results of the above are not known.

Attention will be given to this program on a continuous basis.

SUBJECT: GROUPS SEEKING INDEPENDENCE FOR PUERTO RICO
COUNTERINTELLIGENCE PROGRAM
SUBVERSIVE CONTROL SECTION

CONFIDENTIAL

Federacion de Universitarios Pro Independencia (FUPI) is a Marxist oriented student organization at the University of Puerto Rico (UPR) which is affiliated with the communist controlled International Union of Students.

Special Agent [redacted] of the San Juan Office recognized newspaper photographs taken at the "Solidarity with Cuba" rally in Brazil during April, 1963, as including [redacted] and [redacted] officials of FUPI. He sent the newspaper photographs to the Bureau along with a suggested text in Spanish language to be used in a counterintelligence leaflet to be distributed at the UPR.

The leaflet was prepared at the Bureau and 4,000 copies sent to the San Juan Office where they were distributed anonymously in bulk on 9/5/63 to known anti-FUPI and anticommunist groups at UPR and also in the College of Agriculture and Mechanical Arts in Mayaguez, Puerto Rico. The leaflet clearly shows the communist influence in FUPI

The counterintelligence results from this leaflet were highly successful.

105-93124-1098

(1) "El Mundo," a leading Spanish language daily newspaper in Puerto Rico, reproduced the photographs and part of the text from the leaflets on the front page of the 9/16/63 issue of that paper, thus giving the widest possible dissemination of the damaging information regarding FUPI. REC-3

NOT RECORDED
108 OCT 21 1963

(2) The leaflet created panic and discussion among the ranks of FUPI who believe the leaflet was prepared by an anticommunist organization active on the campus of UPR.

(3) As a result of this panic, FUPI has suspended efforts to recruit new members. They had been in the midst of a recruiting drive at the time.

CONFIDENTIAL

Memorandum to Mr. W. C. Sullivan
RE: GROUPS SEEKING INDEPENDENCE
FOR PUERTO RICO
105-93124

CONFIDENTIAL

(4) The leaflet has made new students aware of the true nature of FUPI as evidenced by the several complaints received by local police from new students and their parents concerning efforts on part of FUPI to recruit new members.

CONCLUSIONS:

Special Agent [redacted] exhibited outstanding initiative in recognizing the officials of FUPI in newspaper photographs and also in recognizing the counterintelligence potential of the photographs. Not only did he recognize the potential but he followed through in submitting his suggested Spanish language text to the Bureau and in the distribution of the completed leaflets.

RECOMMENDATION:

It is recommended that an appropriate incentive award be made to Special Agent [redacted] in an amount to be determined by the Administrative Division.

ADDENDUM: 10/8/63

SA [redacted] is assigned to the Subversive Control Section of the Domestic Intelligence Division and is charged with the supervision of pro-Puerto Rican Independence groups and the supervision of investigations thereof. SA [redacted] displayed outstanding performance in connection with the discharge of his supervisory duties in this matter. He gave instructions and guidance to the field which were clear and concise and made suggestions to the field which were instrumental in bringing this matter to a successful conclusion.

~~ROUTE SLIP~~

TO : Mr. W. C. Sullivan

DATE: October 10, 1968

FROM : Mr. G. C. Moore

SUBJECT: COUNTERINTELLIGENCE PROGRAM
BLACK NATIONALIST - HATE GROUPS
RACIAL INTELLIGENCE -
(BLACK PANTHER PARTY)

PURPOSE:

To recommend attached item be given news media source on confidential basis as counterintelligence measure to help neutralize extremist Black Panthers and foster split between them and Student Nonviolent Coordinating Committee (SNCC).

BACKGROUND:

There is a feud between the two most prominent black nationalist extremist groups, The Black Panthers and SNCC. Attached item notes that the feud is being continued by SNCC circulating the statement that:

"According to zoologists, the main difference between a panther and other large cats is that the panther has the smallest head."

This is biologically true. Publicity to this effect might help neutralize Black Panther recruiting efforts.

ACTION:

That attached item, captioned "Panther Pinheads," be furnished a cooperative news media source by the Crime Records Division on a confidential basis. We will be alert for other ways to exploit this item.

UNITED STATES GOVERNMENT

Memorandum

TO : Mr. W. C. Sullivan

DATE: May 21, 1969

FROM : G. C. Moore

SUBJECT: COUNTERINTELLIGENCE PROGRAM
BLACK NATIONALIST - HATE GROUPS
RACIAL INTELLIGENCE
(BLACK PANTHER PARTY)

Attached is an article concerning the criminal activities of the Black Panther Party (BPP) for the Crime Records Division to furnish a cooperative news media source on a confidential basis.

The extremist and highly violent BPP has been involved in criminal activities since its inception. The BPP has been involved in robberies, attacks on police officers, and other serious crimes. Many individual members have long criminal records. Details of this activity have been compiled in the attached article.

Exposure of these activities by nationwide news media would show the true nature of this extremist group.

ACTION:

That attached article be furnished a cooperative news media source on a confidential basis by the Crime Records Division to expose the criminal nature of the BPP.

Charles Abourezk says FBI report a 'fabrication'

6/26/76

GLADSTONE
River Editor

Charles Abourezk declared in Rapid City Friday that the Federal Bureau of Investigation report released about him this week is "fabricated to serve the FBI's own purposes."

He said he was referring to the investigative report made available by his father, Sen. James Abourezk, Tuesday to the Washington Star. The senator declared at that time that the allegations about his son were part of a smear campaign" to discredit him.

Charles, who said he is employed as an Oglala Sioux tribal attorney, read a prepared statement prepared by himself, Sam Moves Camp, an Oglala Sioux medicine man, and Rene LeDeaux, Rapid City.

It was near LeDeaux's home that Rapid City police began digging Thursday in a search for arms and ammunition.

The three said they feel the FBI memo "released by it to all law enforcement agencies and others of this ~~Bureau~~ served as a method of provoking already tense law enforcement people, who have been told to expect anything this summer, to a point where fear and violence could be their only possible reaction."

Young Abourezk was flanked by Moves Camp and LeDeaux as a Wounded Knee Legal Defense/Offense Committee worker announced that Abourezk would read the statement but "no questions would be answered."

The statement went on; "We know of no such organization as 'Dog Soldiers,'" a term used in the report, provided the senator, and that "none of us has ever transported or stored ammunition, guns or explosives and we have no knowledge of any 'gun running.'"

"This statement is further proven by the fact that Moves Camp is an Oglala Sioux medicine man and cannot carry any kind of weapons, only the Sacred Pipe.

"We feel that this is only one of many such memos and that they serve several purposes: that because of the detailed descriptions of our addresses and vehicles, it serves as a disguised 'hit list' for the various law enforcement agencies across the country, inviting open harassment of the individuals named in it and at worst, providing possible targeting for political assassinations.

"We feel this memo is evidence of a massive domestic intelligence and para-military operation currently in existence within this nation against those who are working for the rights of Native Americans. These memos can only serve to justify escalation of these domestic operations.

"Moves Camp," the statement continued, "was recently a victim of one of these disrupting programs by the government. He was tailed by the FBI all the way to Canada where he was attending a conference of Indian spiritual leaders. This information was purposely leaked by the FBI to a contact participating in the conference, seeking to cause anger and disruption among those attending. Later an FBI teletype similar to this one was released with the same fabricated allegations.

"We strongly feel that we may already be victims of the purpose and intent of this memo.

"Two days ago, an all points bulletin was issued for Charles Abourezk concerning an incident that supposedly occurred in Scenic while at the time he was at a legal office in Rapid City.

"Yesterday and today, Rene LeDeaux's residence was under surveillance by the FBI and local police and they are continuing to dig a large hole outside her yard, supposedly searching for guns. One of her neighbors was offered $500 to give the police information and when she hesitated they offered to increase that ten times.

Stan Zakinski, Rapid City assistant police chief, said the department had offered no reward to anyone for information which led to the digging. He said, "the tip came from what we will have to say is an anonymous source and we paid nothing for it."

The statement read by Abourezk concluded: "We know that the all points bulletin and the search for guns are fabricated setups by the police, and only the beginning of the harassment that we may be receiving in the future, possibly worsened because of the release of this statement."

The report which the senator said was an FBI memo alleges that the "Dog Soldiers" were to meet June 25 or immediately thereafter at the residence of Howell (LeDeaux) for "final assignments to the Dog Soldiers for targets throughout the state on the Fourth of July weekend."

The memo also alleged that Moves Camp, "an acting American Indian Movement member, allegedly transports the weapons from Redman Strebt (number unknown), Omaha, to the residence of Charlie Abourezk."

Rapid City police reported they began the digging near the LeDeaux residence because they had been told that guns, ammunition and explosives were buried in the lot.

State Radio, the Pennington County Sheriff's office, Rapid City Police Department and local office of the U.S. Marshal's Service all said they had heard no all points bulletin for young Abourezk recently.

(Ed. Note: As with other groups targetted by the FBI, the Bureau's analyses and recommendations for action concerning AIM seem contradictory. The FBI memos excerpted below suggest a self-fulfilling prophecy regarding violence, especially through the use of "extremist informants" who often become agents provocateur.)

Airtel to Albany
Re: American Indian Movement (AIM)
(5/4/73)

A forceful and penetrative interview program of individual activists should be instituted. Conduct interviews in accordance with existing instructions under SAC authority if facts necessitating Bureau approval are not present. Such a program should present excellent opportunity for developing extremist informants among Indian activists dedicated to violence and confrontations best exemplified by the Wounded Knee situation.

MP 157-1458
(1975)

The goals and objectives of AIM remain essentially the same, as those stated in the past.

The objectives most frequently espoused in public are:

1. Abolish the Bureau of Indian Affairs (BIA).
2. Establish AIM Indian Survival Schools throughout the country.
3. Cause the U.S. to honor its treaties with the Indian tribes.
4. To acquire separate and independent nation status for Indian tribes occupying federal reservations.
5. To halt strip-mining and similar exploitation of natural resources on Indian land.
6. To generate unification within the Indian people.
7. To bring the economic status of the Indian Americans up to that of the general community.

(1975) Any full investigation involves a degree of privacy invasion and that of a person's right to free expression. Informant coverage is the least intrusive investigative technique capable of producing the desired results. Thus, because of specific factors surrounding this case, it is recommended that a full investigation be conducted.

Director Sec'y

PURPOSE: This position paper was prepared for use of the Director of the FBI to brief the Attorney General and the Deputy Attorney General (DAG) on the role of the FBI in the event of a major confrontation in Indian country (Federal jurisdiction) where (1) the President decides against the use of troops; and (2) the FBI is ordered by the President and/or the Attorney General to deploy FBI Special Agents in a paramilitary law enforcement situation, in lieu of the use of troops.

Throughout the operation there was a definite lack of continuity as each senior representative replaced another. Colonel Volney Warner (now General), Chief of Staff, 82nd Airborne Division, was dispatched to Wounded Knee at the outset to assess the situation and to recommend whether or not troops should be utilized. The AG issued instructions there was to be no confrontation and negotiations with the militants by representatives of the DOJ were to be entered into to resolve the matter and have the hostages released.

There was a divided authority among the many agencies present at Wounded Knee, including church and social groups. The senior Government representative, Departmental Attorneys, and members of the USA's Staff issued conflicting instructions. Each representative present on the scene took instructions for the most part from superiors of his own agency. For example, on March 4, 1973, after consulting with Colonel Warner, Ralph Erickson issued orders that the use of deadly force by the law enforcement officers on the scene could only be used in self-defense to avoid death or serious bodily harm. In the application of force the officers, including FBI Agents, were to aim to wound rather than kill. This was in direct conflict with the policy of the Bureau that an Agent is not to shoot any person except when necessary in self-defense, that is, when he reasonably believes that he or another is in danger of death or grievous bodily harm. Special Agents are not trained to shoot to wound. Special Agents are trained to shoot in self-defense to neutralize the deadly force. The SACs on the scene and officials at FBIHQ strenuously objected to orders such as this which had previously been approved by the AG without consultation with any FBI official.

The FBI encountered extreme problems, both in the field and at FBIHQ, in adapting to a paramilitary role. The FBI was not equipped logistically to operate in a paramilitary situation in open terrain which ultimately ended in a 71-day siege. The FBI and USMS had to be equipped with military equipment, including Armored Personnel Carriers (APCs), M-16s, automatic infantry weapons, chemical weapons, steel helmets, gas masks, body armor, illuminating flares, military clothing and rations. Authority had to be obtained from both the AG (and/or his representative) and from the General Counsel, Department of Defense, prior to requesting the military logistics adviser, Colonel Jack Potter, to obtain the weapons and material through the Directorate of Military Support (DOMS). This clearance was often not forthcoming when clearance had to be obtained during the night hours. This phase of the operation required the FBI to maintain a constant 24 hour vigilance so as to equip our Special Agents and the other law enforcement officers with the weapons and material needed for a defensive operation.

RECOMMENDATION: The Director meet with the AG and DAG to brief them on the Wounded Knee incident so that they fully understand if such an incident occurs in the future or an incident similar to Wounded Knee and the FBI is involved, the FBI will insist upon taking charge from the outset and will not countenance any interference on an operational basis with respect to our actions. They should understand the FBI due to its long years of experience and training is able to make law enforcement decisions without over-reacting to protect the general public, its Special Agent personnel, and the violators of the law. The AG and DAG should be advised it is our broad policy in such instances as this to "get in and get out as quickly as possible" with complete regard for the safety of all concerned. The FBI furthermore would seize control quickly and take a definite, aggressive stand where necessary. It should be clearly stated that the FBI does not desire to become involved in any political situations and definitely not participate in any discussion where it is obviously political in nature.

Dissemination (from 1975 FBI Memo on AIM)

Reports are disseminated when appropriate, to interested agencies, including the Department of Justice, CIA, Secret Service, DIA, and Military Intelligence. In view of foreign travel by AIM leaders and interest in AIM abroad, periodic reports from and to foreign agencies, for information relative to above activities, as well as an interchange of information between the FBI and the CIA, is necessitated.

Due to the AIM's violence potential, which is frequently directed toward local and state governments and police officers, timely dissemination of specific intelligence information affecting their agencies, is of utmost importance.

1975 FBI Memo

MP 157-1458

JOHN FRANCIS TRUDELL

JOHN FRANCIS TRUDELL continues as the National Chairman of the AIM and of the National Leadership has been involved in radical Indian activities longer than any other AIM leader. TRUDELL is an intelligent individual and is an eloquent speaker who has the ability to stimulate people into action. TRUDELL is known as a hardliner who openly advocates and encourages the use of violence although he himself never becomes directly involved in any fighting. [redacted] TRUDELL had established a semi-permanent residence in So. Paul, Minnesota, but his closest and immediate family ties remain in Nevada.

TRUDELL has appeared numerous times on the Lecture Circuit in behalf of AIM and is usually well-received.

TRUDELL, a Santee Sioux, continually attacks the system wherever he goes and is a close friend of AIM National Press Secretary GEORGE ROBERTS. TRUDELL has been active in AIM-type confrontations with authorities at Eagle Bay, New York; Kenora and Ottawa, Ontario, Canada; and Shiprock, New Mexico.

JOHN TRUDELL has been involved in the area of Indian conflicts/demonstrations longer than any other AIM member. He is intelligent and extremely eloquent when he speaks. TRUDELL has the ability to meet with a group of "pacifists" and in a short time have them yelling and screaming "right-on". In short, he is an extremely effective agitator.

TRUDELL is an ardent racist and has been active in supporting a variety of racist groups such as the Puerto Rican Nationalist Party (PRP) through appearances and speeches. TRUDELL favors the forming of coalitions among minority activist groups for increased "political clout".

TRUDELL has spent some time in Lincoln, Nebraska, assisting in the review of Indian Treaties by the federal court.

TRUDELL is a former U.S. Navy Veteran and served in the Vietnam conflict aboard a destroyer.

How Many More? Death at Duck Valley

Water rights activist, Tina Manning Trudell, pregnant wife of American Indian Movement National Chairman, John Trudell, was killed in a fire on 12 February 1979 along with their children and her mother Leah Manning. Arthur Manning, Tina's father and past Tribal chairman, was critically injured in the blaze. All five were killed in an apparent arson attack on their home on the Duck Valley Reservation in northern Nevada.

The apparent attack follows a pattern of threats, repression and murders carried out against members of the American Indian Movement.

Tina Trudell had been a leading organizer in the struggle to retain the water rights to the Wildhorse Reservoir which was built in the 1930's by the Bureau of Indian Affairs for the exclusive purpose of supplying irrigation water to the Duck Valley reservation. Wildhorse Reservoir is the only potential source of water for the reservation but local non-Indians have begun using the reservoir for recreational purposes and have applied to the state of Nevada for exclusive rights to the water as well as the surrounding lands. Tina also worked with John to organize the Minnesota Citizens' Review Commission on the FBI in Minneapolis.

John Trudell, as one of the coordinators of the Leonard Peltier Defense Commitee, was in D.C. when he was notified of the deaths. John had been a featured speaker at the rally on 11 February 1979 in front of the FBI building where he spoke of the abuses perpetrated by the FBI against the Native American people and other movements for social change. At approximately 2:00 pm, during the speech, Trudell burned the American flag as a symbol of the contempt and anger at the continued policy of genocide of the United States government against the Indian people. At 2:00 am, some twelve hours later, the Trudell home was burned by a fire which consumed the cinder block structure. Local people on the Duck Valley Reservation believe that the fire was intentionally set.

In December 1977, while serving 60 days for cursing at a U.S. Marshal in the hallway outside an adjourned court, word came to John Trudell from the FBI that if he didn't cease his activities on behalf of the people or leave the country, the FBI would get him or his family.

AIM has called for a "Red Alert of all our members in what seems to be an escalation of the war against Indian people to rip off all our energy resources and water following the critical situation facing the United States following their defeat in Iran."

72 (Ed. Note: In 1975 a number of investigations were launched into FBI handling of Native American matters. That same year the FBI stepped up a campaign of armed confrontation with AIM members; on several occasions the FBI surrounded homes of AIM members and began firing weapons. In one instance, when AIM members defended themselves and their families, two FBI agents were killed. Almost immediately the investigations of FBI abuses concerning AIM were quietly shelved.)

Chicago Tribune, Friday, March 14, 1975

AIM activist FBI informer

By William Mullen

A KEY AIDE to Dennis Banks, leader of the American Indian Movement, Thursday admitted he was a paid informant for the Federal Bureau of Investigation while he worked for Banks.

Douglas Durham, 37, told reporters at a press conference in the lobby of the Dirksen Federal Building that he had been on the FBI payroll since joining AIM in March, 1973.

Durham said he became so closely involved with AIM leadership that he often wrote position papers for the militant organization, established its national offices, and was privy to secret strategy sessions while he informed on AIM.

At one point, Durham said, he even used $1,000 provided by the FBI to rent a small plane and secretly fly Banks to Canada following the 71-day 1973 AIM occupation of Wounded Knee, S. D.

DURHAM, A FORMER Des Moines policeman, said he became an official AIM spokesman at the same time he was being paid roughly $1,100 a month by the FBI to pass on travel schedules and plans of AIM leaders.

"I was supposed to give the government any information I could find about foreign involvement in AIM," Durham said. He said his spy role bothered him as he came to admire AIM's involvement in Indian civil rights struggles.

"I find it to be a morally upstanding organization that has done nothing illegal," he said.

Joseph Trimbach, special agent in charge of the Minneapolis FBI office, said in response to Durham's statement, "Our policy is not to comment on matters which are subject to a pending litigation." R. D. Hurd, assistant United States attorney for South Dakota and chief prosecutor at the AIM trial in Minneapolis, said he would not comment.

DURHAM'S ACTIVITIES came to light last Friday when AIM officials confronted him in Des Moines with intercepted documents he had been sending to the FBI.

Durham admitted he gave the FBI secret information from defense strategy meetings during the trial of AIM co-leaders Banks and Russell Means when they faced charges from the Wounded Knee incident.

He said he had acted as AIM's security chief during the trial and was privy to the defense strategy meetings. During the trial the federal government produced a sworn affidavit contending the government did not have any informants in the AIM defense team.

Kenneth Tilsen, attorney for AIM, who was with Durham at the press conference along with other AIM officials, said Durham's involvement may have prejudiced other cases now pending against AIM members.

When the government finally withdrew the Wounded Knee case from the courts, Durham continued to work for Banks, acting most recently as Banks' liaison between AIM and police in the Gresham, Wis., monastery occupation in January.

AIM officials have asked Sen. Frank Church [D., Idaho], chairman of the Senate Select Committee on Intelligence, to investigate FBI involvement.

Memorandum

TO : Mr. J. B. Adams
FROM : Legal Counsel
SUBJECT: SENSTUDY 75

DATE: 6-27-75

Attached is a letter from the Senate Select Committee (SSC), dated 6-23-75, addressed to the Honorable Edward H. Levi. This letter announces the SSC's intent to conduct interviews relating to Douglas Durham, a former Bureau informant. The request obviously relates to our investigation at "Wounded Knee" and our investigation of the American Indian Movement (AIM). This request was received 6-27-75, by Legal Division.

On 6-27-75, Patrick Shea, staff member of the SSC requested we hold in abeyance any action on the request in view of the killing of the Agents at Pine Ridge Reservation, South Dakota.

FROM: SAC, NEW YORK (100-161140) (P)

SUBJECT: COUNTERINTELLIGENCE PROGRAM
BLACK NATIONALIST - HATE GROUPS
RACIAL MATTERS
(RNA)

ReNYlet, 4/22/69.

As noted in re NY letter the NYO sent out 32 postcards to RNA members in NYC area advising them to attend meeting of all members at Hotel Diplomat, Saturday, 4/26/69, at 2:00 PM.

[redacted] advised that the RNA members received stamped cards advising them of the meeting scheduled for 4/26/69. An RNA member called [redacted] to verify meeting and [redacted] stated that she did not schedule any meeting on that date. They deduced that police department had stamp duplicated and scheduled meeting to get all RNA members together so they could make mass arrest. [redacted]

At another meeting of RNA all members were requested to submit handwriting specimens with their own pens and in the exact words used in postcards. The RNA officials are trying to determine if this "trick" could have been pulled by an RNA member.

The NYO plans to schedule additional meetings of the RNA, as conditions warrant. The Bureau will be kept advised.

Re Jackson quarterly progress letter to Bureau, 12/2/70

QUARTERLY PROGRESS LETTER

I. OPERATIONS UNDER CONSIDERATION

Jackson informants and other investigation by the Jackson Division has resulted in information being developed that the Republic of New Africa (RNA), which up until this time has only had a small inactive consulate in Miss., has recently been making intense efforts to obtain land in Miss. In this regard, they have recently obtained temporary use of several acres of land owned by a Negro male in a rural area on U. S. Highway 22 near Brownsville, Miss., which is located about 15 miles west of Jackson. The RNA supporters have begun construction of some buildings on this property and the RNA leaders have announced a National People's Center Council meeting will be held at this location on the weekend of 3/26-28/71.

In view of these developments and the potential that this situation has for rejuvenating the membership and the activity of the RNA, Jackson feels that this development warrants counterintelligence action.

Jackson Division is currently evaluating several possibilities for counterintelligence proposals in this regard and it is anticipated that requests for approval of a proposal will be forthcoming in the future.

MAIL ROOM TELETYPE UNIT

(Ed. Note: In 1971 the police and the FBI raided the Mississippi home occupied by citizens of the Republic of New Africa. The raid was conducted under extremely suspicious circumstances and many people believe it was a staged set-up. RNA leader Imari Obedele was in the RNA offices away from the home at the time of the raid. Despite this fact, Obedele - referred to as "Henry" in the FBI memos - was arrested and convicted on charges of conspiracy to assault an FBI agent involved in the raid. While the charges were still pending, the Jackson office of the FBI agitated vigorously to have Obedle tried on the conspiracy charges, even though the Justice Department was worried it had a weak case. Obedele was convicted of the charges and spent years in the penitentiary, being released in late 1979.

Whenth

When the FBI decided to close its case file on the RNA, one of the reasons cited in a 1976 memo was that the shootout in Mississippi and other incidents were "spontaneous" and "not pre-planned or agreed upon by the leadership," thus showing the original conspiracy charges against Obedele to be a fiction created by the FBI itself in order to remove Obedele as an organizer, and disrupt the RNA.)

4:54 PM IMMEDIATE 7/12/73 VCG TELETYPE

TO DIRECTOR (184-38)

FROM JACKSON (89-24) 7P

IT IS APPARENT TO JACKSON THAT SOMEONE ON A HIGH LEVEL IN THE DEPARTMENT OF JUSTICE IS RELUCTANT TO PURSUE THIS MATTER, WITHOUT GIVING JUSTIFIABLE REASONS, IN SPITE OF ASSURANCES TO THE DEPARTMENT BY U.S. ATTORNEY, JACKSON AND DEPARTMENTAL ATTORNEYS IN JACKSON THAT SUFFICIENT EVIDENCE EXISIS TO CONVICT SUBJECT HENRY AND OTHER SUSPECTS AS WELL AS TO OVERCOME THE CURRENT MOTION TO SUPPRESS.

[redacted] AND [redacted] FEEL STRONGLY THAT THIS CASE SHOULD PROCEED IN COURT AND HENRY AND THE OTHER [redacted] SUBJECTS BE HELD ACCOUNTABLE FOR CONSPIRING TO ASSAULT AN FBI AGENT. THEY ARE CONCERNED THAT A MISCARRAGE OF JUSTICE IS ABOUT TO TAKE PLACE. THEY ARE AWARE THE JUSTICE DEPARTMENT HAS SENT ATTORNEYS TO JACKSON DURING PAST SEVERAL YEARS TO HANDLE CASES BELIEVED BY THEM TO BE OF LESS GRAVITY. [redacted] ADVISED HE HAS APPOINTMENTS WITH U.S. SENATORS JAMES O. EASTLAND AND JOHN STENNIS, FRIDAY, 7/13/73, TO REQUEST THEM TO

INTERVENE WITH THE DEPARTMENT OF JUSTICE TO REMOVE WHATEVER OBSTACLES ARE BLOCKING THE ORDERLY PROCEDURE OF THIS CASE INTO USDC FOR TRIAL.

THE BUREAU IS REQUESTED TO DISCUSS THIS MATTER WITH THE DEPARTMENT ON WHATEVER LEVEL IS REQUIRED TO REMOVE ALL OBSTACLES TO PROSECUTION.

IF THIS CASE IS NOT VIGOROUSLY PURSUED AND CHARGES ARE DROPPED, PUBLICITY IN THE MATTER WILL BE SPREAD TO ALL EXTREMIST ORGANIZATIONS THROUGHOUT THE UNITED STATES BY THE RNA. HENRY'S PREVIOUS PUBLIC STATEMENTS CAN LEAVE LITTLE DOUBT THAT HE WOULD UTILIZE SUCH ACTION TO INCREASE HIS OWN STATURE. THE RESULT COULD SERIOUSLY INCREASE SIMILAR ASSAULTS ON AGENTS ACROSS THE UNITED STATES.

DOMESTIC SECURITY INVESTIGATIONS

Re Bureau airtel to Albany, 5/21/76.

UACB, Detroit intends to place its national case file on the RNA (Defile 157-2413) in pending inactive status, in view of the recommendation set forth in summary for discontinuance of investigation of the RNA, its leaders and members.

The following can characterize the above mentioned events:

Violations of the State law by the RNA were not planned and resulting shootouts were spontaneous.

Violations of Federal law were by members. Their actions were not pre-planned or agreed upon by the leadership. These violations dealt primarily in the firearms area.

Handcarried PERSONAL

Dear Director Webster:

Re: Geronimo Pratt Case

I hope you will give this letter your immediate attention, as it raises a very serious matter.

I have finally had the chance to review your letter of July 12 on the above case and to compare it with the documents previously made public by the FBI. I am deeply disturbed to find a statement in your letter that is patently untrue. You say (at page 5):

"Pratt was not the target of the FBI's COINTELPRO".

This may be true as to December, 1968, when the murder allegedly committed by Pratt occurred, but it is clearly not true as to the period of Pratt's arrest and trial, the period when it would have been easiest to frame Pratt.

FBI documents are precise and explicit. A Memorandum from the Special Agent in Charge (SAC) of the FBI's Los Angeles Field Office to the FBI Director, dated January 28, 1970, captioned, "COUNTERINTELLIGENCE PROGRAM, BLACK NATIONALIST -- HATE GROUPS, RACIAL INTELLIGENCE, BPP", proposes that the FBI write and distribute two fake "counterintelligence leaflets" and an anonymous underground newspaper "to attack, expose, and ridicule the image of the BPP in the community and foment mistrust and suspicion amongst the current and past membership." Referring to the first leaflet, the Memo states on page 2:

> "Operation Number One is designed to challenge the legitimacy of the authority exercised by ELMER GERONIMO PRATT, BPP Deputy Minister of Defense for Southern Calirornia."

The second example is contained in an Airtel from SAC Los Angeles to the Director of the FBI, dated August 10, 1970, which bears the same COINTELPRO caption. This Airtel proposes that the Bureau send fake letters to Panther leader Huey Newton, upon his release from prison, charging that during Newton's absence Party members in Los Angeles had been "brutalized and mistreated" by Pratt and David Hilliard, then National Chief of Staff of the BPP. The letters were designed to promote a split in the Party, and to turn Newton against Pratt and Hilliard. If the FBI was willing to jeopardize Pratt's life by this kind of action, is it not reasonable to suppose that the FBI might have been pleased to ask an informer to contend Pratt had committed a specific crime? Or to advise the victim of that crime that Pratt was located at a certain point in a "line up" of potential suspects? It was only four months later that Pratt was "identified" for a crime that had occurred two years earlier!

My primary concern is the question of fairness when an individual accused of a capital crime is tried and convicted of that offense without being informed that he was a target at the time of a strong covert "attack" program such as COINTELPRO, accompanied, as it was, by the use of informers and secret campaigns to discredit the defendant/target. In such a case, it seems to me there is a basic obligation on the government's part to bend over backwards to prove that the defendant was in no way prejudiced by the government's secret program.

An Airtel of October 28, 1969, from the FBI office in San Antonio states:

> "All offices be alert for any information or situations pertaining to these active members of the BPP mentioned above which would lend itself to counter intelligence measures."

In June, 1970, the Los Angeles FBI office prepared a report on Pratt covering an investigating period from 5/6/69 - 6/21/70 which states:

> "Constant consideration is given to the possibility of the utilization of counterintelligence measures with efforts being directed toward neutralizing PRATT as an effective BPP functionary."

I appreciate that the FBI is no longer engaged in deliberate attempts to blacken the reputations of political dissenters or potentially-violent activists. It is hard to escape the conclusion, however, that an organization which would attempt to blacken the reputation of a young pregnant woman, Jean Seberg, by publicizing the suggestion that she had become pregnant, not by her husband but by a member of the Black Panther Party (BPP), would take some pleasure in seeing a Black Panther leader convicted of a crime.

I think it is incumbent upon the government to explain why Mr. Pratt or his attorney were not informed, from the time Pratt was indicted on December 4, 1970 to the time of his conviction on July 28, 1972, that he was a target of COINTELPRO during that period, and that the FBI was using both informers, some of whom were subsequently discredited (as in the case of Darthard Perry) as well as secret campaigns to discredit the defendant/target. If one FBI informer, Darthard Perry, was discredited as you persuasively point out, what about the informer who pointed the finger at Pratt over a year after the crime was committed for which he was indicted? The FBI's position on protecting informants by FOI Act action can only be justified if we can be assured informers weren't used improperly in the COINTELPRO program.

The more I have gotten into this case, the more disturbed I have become at the FBI's actions, both during COINTELPRO and in its FOI posture with respect to COINTELPRO's actions, particularly in the cases of COINTELPRO targets who suffered injury, i.e., being convicted of crimes, without being advised of COINTELPRO.

From your letter, I am forced to the conclusion that the FBI is only acting defensively on COINTELPRO; there is no sense of duty on the FBI's part to search out its records and membership and explain any possibility that Pratt could conceivably be innocent. You properly acknowledge, at page 6 of your letter, that

> "If we had been able to retrieve evidence from our records that might exonerate Pratt, we would have made such evidence available not only as a matter of law, but also as a matter of professional obligation."

I would accept your statement but for the obvious discrepancy between your statement that Pratt was not a target of COINTELPRO and the FBI records which clearly show your statement to be untrue.

As I mentioned in my earlier letter, Pratt's defense attorney, now a highly-respected prosecutor in Los Angeles, believes Pratt to be innocent. It would have been incredibly easy for an FBI informer to both identify Pratt to the police as the tennis court murderer and to assist in his lineup identification. Unless the FBI is satisfied that this did not occur, ordinary rules of criminal justice and burden of proof would dictate that he be granted a new trial and that the jury be advised of COINTELPRO and its possible impact on the facts of the case.

The only way I can satisfy myself that there has not been a miscarriage of justice in this case is to personally examine your complete files, and to discuss the case squarely with the individuals involved. You may be assured that I will treat as privileged any information you contend is privileged under the FOIA from disclosure to persons other than the Congress.

 81

I will call your secretary on Tuesday, September 25, to get your preliminary response to these requests.

Sincerely,

Paul N. McCloskey, Jr.

Memorandum

TO DIRECTOR, FBI (100-448006) DATE: 1/28/70

FROM SAC, LOS ANGELES (157-4054)(P)

SUBJECT: COUNTERINTELLIGENCE PROGRAM
BLACK NATIONALIST - HATE GROUPS
RACIAL INTELLIGENCE
BPP

It is anticipated that this counterintelligence proposal could serve as one phase of a continuous attempt to deny unity of action in the effort of the LA BPP by calling to question the actions of the organization and the legitimacy of its leadership.

It is felt that the production and distribution of these leaflets could be such that the identity of the FBI as the source of the proposed organization could be effectively concealed.

In this respect, Bureau approval is requested in the preparation and dissemination of leaflets similar to the enclosed in the vicinities of 4115 South Central, 9818 Anzac, and 1810 East 103rd Street, locations of BPP activities in Los Angeles. It would be the intention of the Los Angeles Division to distribute leaflet No. 2 seven to ten days following the introduction of leaflet No. 1, as any follow up should not only make the effort a topical one, but stimulate increased reaction within the Los Angeles BPP.

Operation Number One is designed to challenge the legitimacy of the authority exercised by ELMER GERARD PRATT, BPP Deputy Minister of Defense for Southern California, and JOHN WILLIAM WASHINGTON, an active member of the BPP in Los Angeles.

82

TO: DIRECTOR, FBI (100-448006)

(1970)

In addition, it is suggested the following handbill be anonymously sent to NEWTON and all existing BPP Offices in an effort to further provoke NEWTON's displayed instability:

WANTED

for

CRIMES AGAINST THE PEOPLE

HUEY P. NEWTON

NEWTON has been found guilty of avaricious exploitation of the masses, use of the revolution for personal wealth and recognition, selling out the people to white mother country liberals and wreckless vamping on Elmer Pratt and other revolutionary brothers.

DANGER

NEWTON is known to be emotionally unstable and on the brink of mental breakdown. Use caution when approaching.

ALL POWER TO THE PEOPLE

AND IMMEDIATELY RETURN GERONIMO

TO THE PEOPLE'S VANGUARD

As usual, if the above proposal is approved, appropriate measures will be used to insure the Bureau's identity is not revealed as the source. Results of the proposal will be immediately forwarded to the Bureau.

Page 670 of 3957

Part Four: Deception and Cover-Up

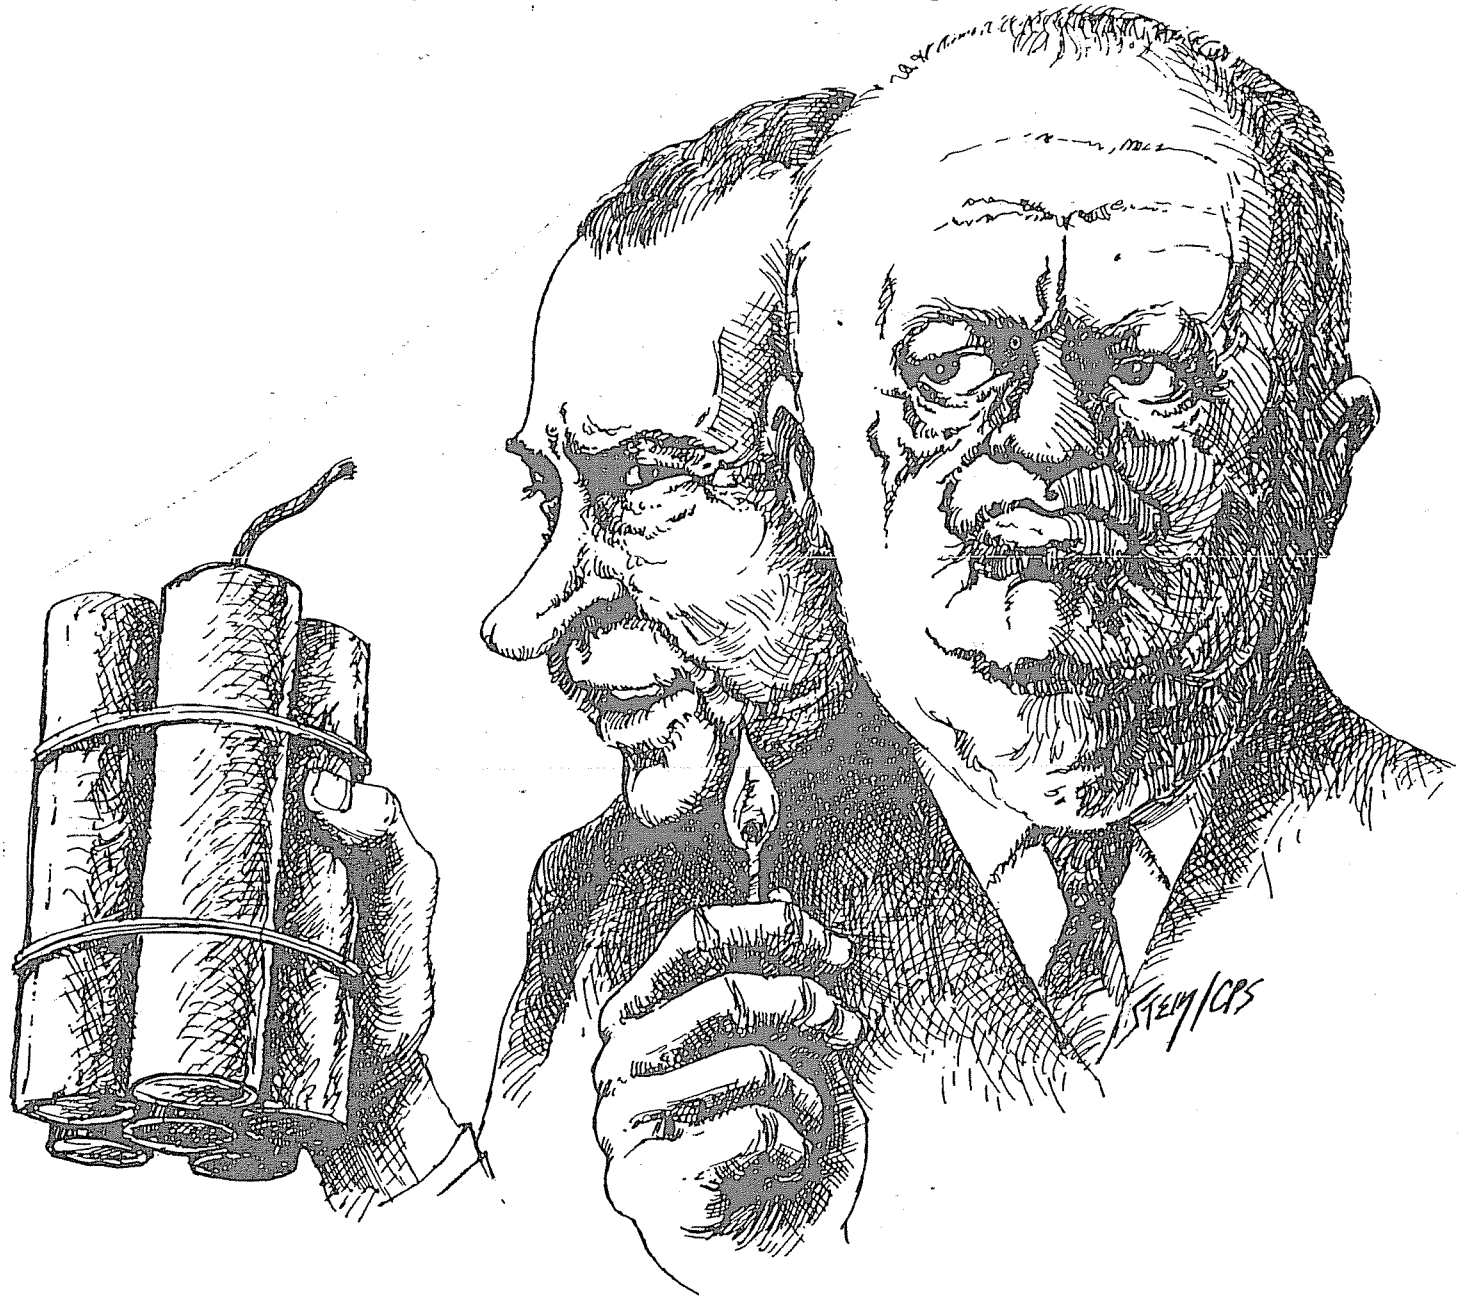
The illegality of FBI counterintelligence tactics and operations creates a great need for concealment and cover-up, an art they have perfected to a high degree. As with many false prosecutions, the Department of Justice has been a willing partner in many cover-ups and manipulations of the judicial system.

In 1969, Richard Nixon appointed Jerris Leonard as chief of the Civil Rights Division of the Justice Department, while Leonard also secretly headed up a broad based political intelligence apparatus within the government known variously as the Inter-divisional Intelligence Unit(IDIU) and the Special Disturbance Group (SDG). The Civil Rights Division then became a focal point of government cover-up operations. After the Hampton raid, Leonard was sent to Chicago by John Mitchell to "investigate" the police action. Leonard empaneled a Federal Grand Jury, which heard four months of testimony but returned no indictments of Hanrahan or his police, despite the overwhelming evidence that the raid had been a "search and destroy" mission against the BPP. Leonard, the FBI, and Hanrahan also kept the FBI's role in the raid secret from this Grand Jury. Leonard also headed up the first Grand Jury investigation into the Kent State murders, which similarly returned no indictments after Richard Nixon had instructed Leonard that no guardsmen should be charged.

The FBI and the Justice Department collaborated to suppress over 200 volumes of inculpatory documents in the Hampton civil rights trial; perjured themselves at Wounded Knee trials and the case against the Vietnam Veterans Against the War at Gainesville, Florida; destroyed evidence germane to the King assassination, and evidence of their illegal actions in pursuing the Weather Underground; covered up their role in the assassinations of King and Malcolm X; repeatedly lied to judges in the Hampton and Socialist Workers Party cases; and concealed damning counter-intelligence evidence from the Senate Select Committee on Intelligence.

In conjunction with such varied and extensive wrongdoing in legal proceedings, the FBI and Justice Department often worked secretly with judges to further their aims. Judge Irving Kaufman worked directly with the Justice Department and the FBI to assure that the Rosenbergs would be executed, and later joined with them to spread pro-government propaganda about the case; the current Chief Judge of the Northern District of Illinois, James Parsons, while a District Court Judge, made derogatory public statements concerning the Nation of Islam and the BPP at the instigation of counterintelligence agents; former Chief Judge William Campbell intervened in the Chicago 8 Conspiracy trial to assure J. Edgar Hoover that a defense subpoena for surveillance documents would be quashed, and secretly passed information from Judge Hoffman to the FBI concerning possible contempt citations against the defendants and their lawyers. Hoff-

man also met secretly with FBI agents and U.S. Attorney Thomas Foran to discuss these contempt citations. In the Hampton trial, Judge J. Sam Perry met secretly with both the FBI and police lawyers to discuss documents which were to be turned over to the Panther plaintiffs. Perry also wrote ex parte letters to then Attorney General Levi praising the conduct of FBI agents and their attorneys who had withheld important documents, and told the Assistant U.S. Attorney investigating charges of misconduct to let the court dispose of the matter at the end of the trial. An Appeals Court Judge, Wilbur Pell, who issued a stinging dissent protesting the ordering of a new trial in the Hampton case, turned out to be a former FBI agent himself, and a long-time member of The Society of Former Special Agents, which was fundraising to defend FBI agents charged with misconduct while the judge was hearing the case.



SAC, Newark (100-50166) 1/9/70

REC-[illegible]
Director, FBI (100-449698) -895

1 - [redacted]

COINTELPRO - NEW LEFT

Reurlet 12/22/69.

Authority is granted to make the anonymous mailing as suggested in relet.

In preparing the letter, all necessary steps are to be taken to protect the identity of the Bureau as the source of the letter. Advise of any results noted.

RHH:jes
(4)

New York should insure use of unwatermarked bond stationery in connection with the above and utilization of mailing procedures which will not allow the Bureau's identification as the origin of this correspondence.

You must insure that Racial Matters Supervisor, Special Agent Coordinator for this program and Agents assigned to Racial Matters investigations are aware of continued objectives of this program and that meaningful proposals are submitted to the Bureau on a timely basis. Insure that such Supervisor and Coordinator are aggressively and enthusiastically ramrodding this program and that Agents are exercising ingenuity and initiative to accomplish this program's objectives.

You are reminded that counterintelligence operations must be approved by the Bureau. Proposals submitted must be designed to insure there is no possibility of embarrassment to the Bureau.

~~COINTELPRO~~ - NEW LEFT

Neurlet 7/31/68.

It is felt that the mailing of a letter under the caption "Black Nationalists for Freedom," a fictitious organization, as recommended in relet has merit and should be pursued. Prior to taking this action, you should alter your letter in the following respects:

Since it is not likely that a militant black nationalist would have information about [redacted] attendance at meetings of the CP held in Los Angeles, you should delete this particular reference from your letter.

Your characterization of SDS too closely follows the published Bureau description of that organization. For this reason, you should paraphrase the last line of paragraph three so that it will not appear to have been taken from a Bureau document. In this regard, a statement such as "If you don't know it man, the head whitey of the Communist Party in the United States told newsmen in San Francisco that SDS was one of the Party's sould brothers," should be substituted.

1 MAILED 6 AUG 8 1968 COMM-FBI

After making the above changes, you are authorized to make the mailing as suggested.

You should take all possible steps to assure that the Bureau is not identified as the originator of the letter. In this regard, the letter should be prepared on locally obtained stationery that cannot be traced to the Bureau or to the Government.

Advise promptly of any results obtained.

FBI Veiled Illegal Break-Ins

wp. 4/25/75

By George Lardner Jr.

With top-level approval, the FBI carried out hundreds of illegal break-ins under an elaborate "Do Not File" system that kept all trace of the burglaries out of regular bureau files.

Members of the Senate intelligence committee, which began delving into the so-called "black bag jobs" yesterday, said they were shocked by the devious manner in which the burglaries of "domestic subversives" were authorized.

"It's really the perfect cover-up," declared Sen. Richard S. Schweiker (R-Pa.).

"Pure frightening," Sen. Howard H. Baker Jr. (R-Tenn.) agreed later.

The statistcs on the burglaries, admittedly incomplete, were not supplied to the committee until the night before yesterday's hearing, staff members said.

Chairman Frank Church (D-Idaho) said the report showed 238 break-ins between 1942 and April of 1968 against 14 so-called "domestic subversive targets."

In addition, at least three other "domestic subversive targets" were subjected to numerous entries from October, 1952, to June, 1966. Of these, the FBI said, "since there exists no precise record of entries, we are unable to retrieve an accurate accounting of their number."

The Washington Post reported in July that the FBI until 1966 conducted dozens and occasionally more than 100 burglaries of all kinds each year, against targets ranging from domestic extremist groups and the Communist Party to foreign embassies and ordinary criminal cases.

The Church committee did not make public any information concerning FBI break-ins at foreign embassies and consulates. For its part, the FBI apparently did not bother to submit a count of the break-ins involved in criminal cases, on grounds that all these were done simply for the purpose of installing "authorized" eavesdropping devices.

Elaborating on the procedures used to approve "black bag jobs," the Sullivan memo said the system then in effect required detailed requests from FBI bureau chiefs for eventual submission in memorandum form to either Hoover or his longtime aide, the late Clyde Tolson, for approval.

"Subsequently, this memorandum is filed in the assistant director's office under a 'Do Not File' procedure," Sullivan explained. Meanwhile, "in the field, the special agent in charge prepares an informal memorandum showing that he obtained bureau authority and this memorandum is filed in his safe until the next inspection by bureau inspectors, at which time it is destroyed."

Testifying at yesterday's hearing, Sullivan's successor former Assistant FBI Director Charles Brennan, said the system meant that the headquarters memos reflecting Hoover's or Tolson's approval would be tucked away in the safe of the appropriate assistant director. There, he said under questioning by Schweiker, it would be kept out of the regular bureau files

Schweiker pointed out that regular FBI files carry serial numbers. As a result, those records cannot be destroyed without leaving a missing number, a telltale sign that something has disappeared.

The system also guaranteed peace of mind for agents in the field offices, knowing that authorizing memos could be shown to bureau inspectors and at the same time knowing that those memos were going to be destroyed, Schweiker marveled.

"It looks to me as though the bureau has perfected a better technique . . . a lot more sophisticated and refined than the 'plausible denial' of the CIA," Schweiker said. "I think we've just touched the tip of the iceberg."

The three-page Sullivan memo ended with an edict in Hoover's handwriting decreeing that "no more such techniques must be used."

Under questioning by Schwarz, Brennan said the FBI director had never shown any legal qualms about such illicit operations in earlier years. Instead, he suggested that Hoover began to grow uneasy after reaching mandatory retirement age (70) in 1965 about any operations that might be embarrassing to the bureau and thus force his ouster.

Although President Johnson waived Hoover's retirement, Brennan said that from 1965 on the FBI director was holding his job largely on an "annual renewal" basis. "That put him into a somewhat vulnerable position," Brennan told the committee.

(See Sullivan "Black Bag Job" Memo on next two pages)

88 Memorandum

: Mr. C. D. DeLoach

DATE: July 19, 1966

: W. C. Sullivan

DO NOT FILE

1 Mr. DeLoach
1 Mr. Sullivan

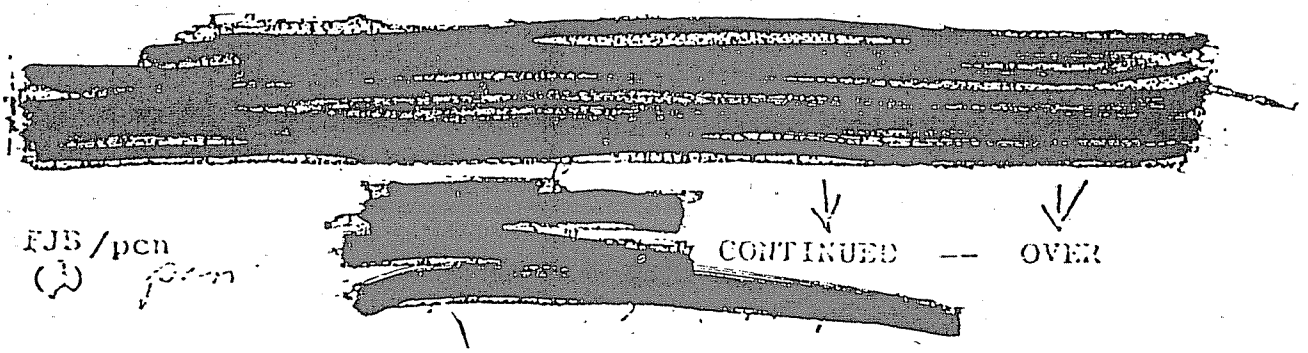
SUBJECT: "BLACK BAG" JOBS

The following is set forth in regard to your request concerning the authority we have for "black bag" jobs and for the background of our policy and procedures in such matters.

We do not obtain authorization for "black bag" jobs from outside the Bureau. Such a technique involves trespass and is clearly illegal; therefore, it would be impossible to obtain any legal sanction for it. Despite this, "black bag' jobs have been used because they represent an invaluable technique in combating subversive activities of a clandestine nature aimed directly at undermining and destroying our nation.

The present procedure followed in the use of this technique calls for the Special Agent in Charge of a field office to make his request for the use of the technique to the appropriate Assistant Director. The Special Agent in Charge must completely justify the need for the use of the technique and at the same time assure that it can be safely used without any danger or embarrassment to the Bureau. The facts are incorporated in a memorandum which, in accordance with the Director's instructions, is sent to Mr. Tolson or to the Director for approval. Subsequently this memorandum is filed in the Assistant Director's office under a "Do Not File" procedure.

In the field the Special Agent in Charge prepares an informal memorandum showing that he obtained Bureau authority and this memorandum is filed in his safe until the next inspection by Bureau Inspectors, at which time it is destroyed.



FJB/pcn
(3)

Memorandum to Mr. C. D. DeLoach
Re: "BLACK BAG" JOBS

[redacted]

We have used this technique on highly selective basis, but with wide-range effectiveness, in our operattions. We have several cases in the espionage field, [redacted]

Also, through the use of this technique we have on numerous occasions been able to obtain material held highly secret and closely guarded by subversive groups and organizations which consisted of membership lists and mailing lists of these organizations.

This applies even to our investigation of the [redacted] You may recall that recently through a "black bag" job we obtained the records in the possession of three high-ranking officials of a [redacted] organization in [redacted] These records gave us the complete membership and financial information concerning the [redacted] operation which we have been using most effeftively to disrupt the organization and, in fact, to bring about its near disintegration.

In short, it is a very reliable weapon which we have used to combat the highly clandestine efforts of subversive elements seeking to undermine out Nation.

RECOMMENDATION:

For your information.

No more such techniques must be used.

Hoover's secretary destroyed his personal files

CHICAGO SUN-TIMES, Tues., Dec. 2, 1975

WASHINGTON (AP) — J. Edgar Hoover's long-time secretary told Congress Monday that when the FBI director died in 1972, she systematically destroyed his personal files "as Mr. Hoover indicated he wanted."

Helen W. Gandy told the House government information subcommittee that she and another secretary went through all the files in Hoover's offices, destroying all marked "personal."

"There were 30 or 32 file drawers," she testified. "I tore them up and put them in cartons. They were then taken to the Washington FBI field office to be either incinerated or shredded."

Mrs. Gandy denied that the files she destroyed contained any official FBI business or information on the personal lives of public officials.

But former FBI Asst. Director William C. Sullivan said Hoover's personal files were filled with political and personal information on public figures.

Miss Gandy also said that she did not consider her actions in violation of an order by then acting-Atty. Gen. Richard G. Kleindienst that Hoover's offices be sealed.

Asked whether he thought Miss Gandy's action violated his order, Kleindienst said that "I'll just have to leave that up to you to draw your own conclusions."

Miss Gandy testified that official files were retained by the FBI.

"Mr. Hoover would not have allowed them (his personal files) to be used if he had been living," she testified. "I had my instructions."

Miss Gandy repeatedly said she found nothing in the personal files that did not relate strictly to Hoover's personal matters.

She said Acting FBI Director L. Patrick Gray III leafed through the personal files before telling her it was "perfectly all right" to destroy them. Gray succeeded Hoover.

Rep. Toby Moffett (D-Conn.) told Miss Gandy that her testimony contradicted with what Gray had told the subcommittee staff. Miss Gandy offered no explanation.

Sullivan, who is in poor health, gave his statement in a taped interview with a committee staff member. On Hoover's files on public figures, Sullivan said: "I think we all know that it was there. I've seen on a sufficient number of occasions that the door was open on those special little filing cabinets on the wall to know that they were really filled with material . . . they were just loaded."

Key evidence destroyed by FBI

Chic. Sun Times, 1978

By Ronald J. Ostrow
Los Angeles Times Special

WASHINGTON—Potentially crucial evidence in the FBI break-in case was destroyed by the FBI after it had been turned over to the agency by Justice Department prosecutors, court records disclosed Tuesday.

The lawyer for former Assistant Director Edward S. Miller, one of three ex-FBI officials indicted in the case, said that up to 40 per cent of the material originally seized by investigators at FBI offices in Washington and New York had been destroyed.

Miller's attorney, Thomas A. Kennelly, said he had been "informally advised" of the evidence destruction by FBI agents, but had been given no explanation as yet for the action.

HE CITED the destruction of the evidence in arguing that the case against Miller should be dismissed.

Other sources familiar with the case said the destroyed records were "ticklers" — in FBI parlance, copies of documents — that bore handwritten notations that could have been read to indicate that break-ins had been committed. The existence of such evidence would help the defense in its efforts to show that break-ins were a relatively commonplace tactic well-known throughout the Federal Bureau of Investigation.

IT COULD NOT be learned why the Justice Department prosecutors returned such potential evidence to the FBI before it was used in court.

The material was destroyed under FBI rules that require the destruction of "ticklers" after periods ranging from 30 days to six months, according to the knowledgeable sources.

An FBI spokesman would not comment on the disclosure and Terrence B. Adamson, the Justice Department's director of public information, said: "We'll have to answer that in court."

Miller, former acting FBI Director L. Patrick Gray III and W. Mark Felt, No. 2 man under Gray, were indicted April 10 on charges of ordering the FBI break-ins to try to track down fugitive members of the Weatherman terrorist organization. Kennelly said he could not specify the nature of the destroyed records other than to note that they "related directly to the matters alleged" by the indictment.

"I CAN ONLY assume that if the [Justice] department thought enough of it to send agents to seize it, they must have thought it was important," Kennelly said. Kennelly described in his court motion another document that he said he had been "informally advised" had disappeared.

This was a three-page White House memorandum on a May 26, 1971, meeting between then-President Richard M. Nixon, former Atty. Gen. John N. Mitchell, former FBI Director J. Edgar Hoover and then-presidential aides John D. Ehrlichman and Egil Krogh.

THE MEETING took place the same day as a phone call between Nixon and Hoover in which the former President allegedly directed Hoover to "do something" about terrorists who claimed responsibility for murdering several New York policemen and added that he wanted "no punches pulled."

Such evidence could aid the defense in establishing that the break-ins had been approved by higher authorities.

Miller, in the court filing Tuesday, also said he had a witness who will testify that Miller on two occasions between May and July, 1973, discussed "surreptitious entries" with then-acting FBI Director William D. Ruckelshaus, who later became No. 2 man in the Justice Department.

FBI lied on Socialist data, judge says

NEW YORK (AP) — A federal judge Wednesday said that the FBI lied when it said it received information on the Socialist Workers Party without resorting to burglaries.

U.S. District Court Judge Thomas P. Griesa said the government was guilty of intentionally omitting information to protect itself. The party is suing the government for $37 million and is seeking government files before the trial.

The dispute involved Timothy Redfearn, a Federal Bureau of Investigation informant in Denver. The government told the party last month that Redfearn, then identified only by a code number, got leaflets from a "college campus," phone lists, other lists and financial data "as they were made available" to party members.

But Friday, FBI files from 1973 were turned over by court order to party lawyers. The files showed that materials were "stolen" and "removed" by Redfearn from an office, a bookstore and the home of three women affiliated with party.

Griesa said the FBI's original statement "was false, and the response failed to disclose the thing that is crucial . . . namely, that documents had been obtained by means of entries into premises, something which the plaintiff would characterize as 'burglaries' — and they want to try that issue."

"Their haste was no excuse," snapped Griesa. "I can draw no other conclusion than that the person making that answer intentionally omitted materials that were unfavorable to the government when he tried to summarize that file.

"Let's face it. Let's not waste time talking about haste. That was absolutely inexcusable."

Was King Slaying Data Destroyed?

Associated Press

The House Assassinations Committee is investigating an unconfirmed report that documents relating to the murder of Dr. Martin Luther King have been destroyed, according to chief counsel Richard Sprague.

Speaking with reporters after a closed meeting of the committee yesterday, Sprague said the information about the missing documents was uncovered by staff investigators in Memphis, where King was killed in 1968.

Sprague cautioned that the information was "completely unverified." He said he had not yet determined that the documents had, in fact, been destroyed or that they related to the King murder.

Sprague's comment appeared considerably more cautious than his earlier statement about the missing documents.

After a morning session, Sprague told reporters that the documents were "relevant to our investigation" and that "I have been advised that the destruction has been since it was announced (in September) that this committee would be investigating" the King and Kennedy slayings.

Sprague would not say which law enforcement agency had the documents allegedto have been destroyed. However, committee member Rep. Henry Gonzalez, D-Tex., told a reporter he believed the documents had been in the possession of authorities in Tennessee, where King was killed in 1968.

THE MEMPHIS Police Department has denied that any documents relating to the King case have been destroyed. Lt. William Schultz said that all of the King files were turned over to the state attorney general in Memphis.

There have been published allegations that some of these had been burned in September when the department destroyed records of its intelligence division. These records were burned as the department faced lawsuits filed by individuals on whom the department had allegedly conducted surveillance during the 1960s.

At the unexpected public session of the House Committee on Assassinations, Gonzalez asked staff attorney Robert Ozer if he had any reason to believe that documents relating to the King case had been destroyed "since the constitution of this committee."

"Yes, sir," Ozer replied. "I believe there are some documents that have been destroyed."

The hearing, originally expected to be held in secret, was opened to the public after a motion to go into executive session failed on a 6-6 vote. Rep. Christopher Dodd, D-Conn., led the argument to open the hearing.

Files on Panthers withheld

CHICAGO SUN-TIMES, March 25, 1976

By Dennis Fisher

The Justice Department has withheld massive amounts of evidence from lawyers for the survivors of a police raid on a Chicago Black Panther apartment in which two Panthers were killed, testimony in U.S. District Court showed Wednesday.

The surprising disclosure could mean the survivors will win the part of their damage suit that pertains to federal defendants, attorneys in the case said.

The documentary evidence — files on the Black Panther Party, informants and plaintiffs in the complicated suit — takes up more than 30 feet of file space.

After two days of testimony from Federal Bureau of Investigation agent William Deaton and in several conferences in the chambers of U.S. District Court Judge Joseph Sam Perry, attorney for the plaintiffs James D. Montgomery said he will consider seeking sanctions against the federal defendants and their lawyers.

Montgomery described the turn of events as highly prejudicial to his clients in the trial, now in its third month.

The sanctions could include contempt-of-court citations, fines, the costs of Montgomery's preparation for the case over the last six years and, most significant ,a default judgment against the federal defendants.

Judge Perry had ordered the complete files turned over as the trial began last Jan. 5. He said repeatedly during hearings Tuesday and Wednesday on the withheld documents that there was no excuse for such flouting of the rules.

By the close of court Wednesday, defense lawyers in the case had agreed to make copies of all of the withheld materials and to begin Thursday to go through the lengthy process of reviewing each document to determine its relevancy. That could take days, lawyers said.

Panthers urge foes be held in contempt

Chicago Daily News 3/30/76

By Rob Warden

Black Panther lawyers argued Tuesday that FBI and Justice Department officials should to be held in contempt of federal court for trying to conceal a 30-foot stack of subpenaed documents.

The documents are potential evidence in a Panther lawsuit asking damages of $47.7 million for the 1969 West Side raid in which Fred Hampton and Mark Clark were killed.

U.S. District Court Judge Joseph Sam Perry ordered all FBI files on the local Panthers produced weeks ago, and Justice Department lawyers assured him repeatedly that they had complied fully with the order.

But it was discovered accidentally last week that only a small percentage of the documents had been produced. Of about 1,600 documents in Hampton's file, for instance, the FBI and Justice Department turned over only 57.

Because the files contain information that might identify FBI informants, the judge permitted the FBI to remove that information before producing the files.

But in this he relied solely on the defendants to decide what they should produce to be used in the case against them.

The deletion process was supposed to be supervised by FBI Agent Robert T. Piper, a defendant in the case, and his Justice Department lawyers, Edward S. Christenbury and Arnold Kanter.

CDN 4/30/76

THIS WEEK IT WAS revealed in court that one of the documents initially withheld described the FBI's role in planning the Dec. 4, 1969, raid, which was carried out by Chicago police under the control of then State's Atty. Edward V. Hanrahan.

The document — an FBI memo initialed by Piper and dated Dec. 8, 1969 — stated that the raid was based on information supplied by informant O'Neal.

The memo, addressed to FBI Director J. Edgar Hoover, said the Chicago office of the FBI had supplied local authorities with a detailed floor plan of the apartment to be raided and an inventory of weapons kept there.

"The raid was based on information furnished by the informant," the memo stated.

This is important in view of the fact that all three FBI agents denied flatly on the witness stand that they had anything to do with the raid.

Panther case revisited

During the Nixon years, the same government official publicly in charge of protecting civil rights was privately named the co-ordinator of all government snooping on political dissidents.

Indications of that apparent conflict of interest are buried in Chapter 10 of the Rockefeller Commission's report on the Central Intelligence Agency's domestic activities. This was the setup:

In 1969, Jerris Leonard was publicly named assistant attorney general in charge of all civil rights under Atty. Gen. John N. Mitchell. In that job Leonard was concerned mostly with the protection of rights for minority group members.

In 1969, Mitchell secretly named Leonard head of two justice Department units charged with supervision and co-ordination of the clandestine gathering of information on groups that supposedly posed a threat to peace in the nation's streets — the anti-war protesters of the day and militant minority groups, for example.

In that job, Leonard was to work with the CIA, the FBI, military intelligence groups and other government units.

So publicly we had Leonard-the-protector-of-the-Constitution and, privately, Leonard-the-co-ordinator-of-spying-information.

The problem in this is best highlighted by Leonard's activities in the Chicago Black Panther case. After the 1969 raid, Leonard was named to head an investigation of possible civil rights violations by Chicago police which was, at the time, the only known agency involved in the raid. No indictments resulted.

We now know that the FBI had infiltrated the Panthers and recently Thomas J. Dolan of the Sun-Times staff reported that at least one report was routed to Leonard's intelligence-co-ordinating Interdepartmental Information Unit. Leonard denies he ever saw that report.

He also denies that any conflict of interest existed. We're not so sure. Leonard will be giving a civil-suit deposition here next month and the conflict should be explored. Further, Chapter 10 of the Rockefeller Commission report should be reread by the congressional committees investigating the CIA.

Judge still trusts the FBI

By Rob Warden

The judge in a landmark Black Panther civil rights damage suit has announced that his confidence in the FBI hasn't been shaken by charges that it covered up its role in the death of Fred Hampton.

U.S. District Court Judge Joseph Sam Perry told lawyers in the case Wednesday that his "confidence in the FBI is such" that he was entrusting to its care 94 volumes of irreplaceable documents that conceivably could prove or disprove that there was a cover-up.

WHEN Panther lawyer G. Flint Taylor Jr. asked Perry at least to direct the FBI not to destroy the documents, the judge replied angrily:

"I don't need to direct them. I don't want to presume that they would destroy them."

Judge's actions cited in Panther lawyer's defense

By Dennis D. Fisher

Lawyers for survivors of the 1969 raid on the Black Panthers here filed a lengthy list Thursday of the trial judge's actions, which, they said, were so prejudicial that a contempt citation against one of the attorneys should be set aside.

G. Flint Taylor Jr. and Jeffrey Dennis Cunningham attached to the list submitted to the U.S. Court of Appeals a sworn statement by a former assistant U.S. attorney that quoted the trial judge as saying the FBI never would be found guilty of conspiring to violate the civil rights of the Black Panthers.

Sheldon Waxman, the former assistant U.S. attorney, who was the government's lawyer in the case at one time, made the affidavit Dec. 22, 1975, two weeks before the trial began.

Waxman said under oath that he had two conversations with the U.S. District Court senior judge, Joseph Sam Perry, one in November, 1975, and one a week later on Dec. 1.

In the first conversation, Waxman said, he asked Perry at a political dinner whether the judge had seen newspaper articles about revelations from the Senate intelligence committee concerning an FBI counterintelligence program that focused on the Panthers.

The former prosecutor said the judge told him he had not seen the articles and that the committee's report wasn't relevant too the Panther case before him.

In the second conversation, in the Dirksen Federal Building, Perry told Waxman, according to the latter, "They (the Panther lawyers) will never be able to prove that the FBI killed those fellas." The reference to killing was to the police slaying of Panther leaders Fred Hampton and Mark Clark on Dec. 4, 1969, in an apartment at 2337 W. Monroe.

Perry cited Panther attorney Taylor for contempt last Nov. 11 after the lawyer knocked over a glass water pitcher, which broke on the courtroom floor, while the jury was absent. There is a dispute over whether the incident was intentional. Perry jailed Taylor for five hours.

The FBI's involvement in the deaths of Hampton and Clark is central to the conspiracy trial over which Perry has presided for the last year.

Survivors of the raid, assertedly conducted in a search for illegal weapons, charged that FBI agents and an FBI informant violated their civil rights intentionally in helping to plan and carry out the raid. They seek $47.7 million in damages.

Minister tells talk with Panther judge

By Dennis D. Fisher

Lawyers for the Black Panther plaintiffs renewed charges that the trial judge is prejudiced and filed an affidavit from a minister Wednesday to support their request that the judge remove himself.

G. Flint Taylor Jr., a plaintiffs' lawyer, asked U.S. District Court Senior Judge Joseph Sam Perry to declare a mistrial in the case.

Taylor charged that Perry, 80, "has prejudged the issues and committed countless prejudicial errors in his efforts to make the evidence and verdicts conform with his pre-set opinions."

The lawyer attached a two-page affidavit by the Rev. Thomas W. Strieter, pastor of Grace Lutheran Church, Glen Ellyn, a former Maywood village trustee, to support the bias charges and request for a mistrial.

Mr. Strieter said that he was a chaplain for an American Legion parade last May 31 in Glen Ellyn. During the Memorial Day festivities, the minister rode in a car with Judge Perry and "engaged in a lengthy conversation," he said.

During the talk, Mr. Strieter recalled, "Judge Perry volunteered in substance the following: If only the lawyers would stick to what happened on Dec. 4, 1969, they might make a case. But this conspiracy involving the FBI and Hanrahan is impossible. This cannot be true. There is no earthly way to establish that."

The conspiracy reference involve charges in the lawsuit that Federal Bureau of Investigation agents teamed up with former State's Atty. Edward V. Hanrahan to violate intentionally the civil rights of the Panthers and to kill Hampton and Clark.

Judge Perry dismissed Hanrahan and the FBI as defendants from the case last month without explaining his decision to the jury.

Mr. Strieter said that when he read Hanrahan was dismissed from the case, he was reminded of his conversation with Judge Perry last Memorial Day.

Perry ex parte messages in Panther case revealed

CHICAGO LAWYER December, 1979

By Chip Berlet

Judge Joseph Sam Perry, while presiding over the Black Panther civil case, wrote a series of ex parte letters to government officials exonerating the FBI defendants and their attorneys from charges that they wrongfully withheld key documents — charges made by the plaintiffs' attorneys in sanction and contempt motions which were pending before the judge when he wrote the letters.

Judge Perry also suggested in one letter that a much-publicized Justice Department investigation into the charges of wrongdoing be "left to the court" to deal with after the end of the trial.

According to the Panther attorneys, the letters were part of an attempt to "whitewash" the defendants' actions in withholding material; and further, that they show Judge Perry "advocated the Defendants' cause" while hearing the case.

In a motion filed in mid-November, the Panther attorneys ask the U.S. Court of Appeals for the Seventh Circuit to immediately issue its mandate ordering a hearing "to determine what sanctions to impose against the FBI defendants and their lawyers." The Seventh Circuit previously had issued the order along with a call for a new trial, but the defendants have requested a stay on all matters while they ask the U.S. Supreme Court to grant a review.

The Panther attorneys, from the Peoples Law Office, also have asked that disciplinary action be taken against Perry for his ex parte letter writing in the middle of the controversial case. The letters, marked "confidential" and written on Perry's court stationery, are important not only because they show improper actions by the judge, charge the Panther attorneys, but also because they are part of a chain of events whereby the Justice Department was able to postpone its investigation into misconduct by the FBI defendants and their attorneys, knowing in advance that Judge Perry would eventually exonerate the men. The Justice Department apparently closed the investigation, citing the Judge's ruling at the end of the trial.

Because of this investigative shell game, there has never been either a hearing or probe into the charges that the FBI agents and their attorneys conspired to withhold crucial evidence. The evidence links the FBI Counterintelligence Program (COINTELPRO) to the assault on Chicago Panther headquarters

After reviewing the FBI files and determining they were relevant to the case, the Panther attorneys alleged bad faith and moved for a "mistrial, default judgment, contempt, and other sanctions" against the defendants and their attorneys. Judge Perry denied the mistrial and said he would hear the sanctions motions after the case was concluded.

Meanwhile, two black state legislators, Sen. Richard Newhouse and Rep. Harold Washington, wrote a letter to then-U.S. Attorney General Edward H. Levi charging the three Justice Department attorneys with a "massive, illegal cover-up" of the FBI's role in Hampton and Clark's death. The letter went on to call for the firing of the three attorneys, saying they had utilized their offices to "violate the law and the public trust."

In response to the letter by Newhouse and Washngton, the Justice Department ordered an internal investigation led by assistant U.S. Attorney Charles Kocoras. Kocoras sent a copy of the legislators' letter to Perry on April 21, 1976, and invited "any comments you might have . . . with respect to the propriety or impropriety of the conduct of the government lawyers in this case . . . your observations would be of great significance in determining the validity or invalidity of the charge."

Two days later, without informing the plaintiffs, Perry responded to Kocoras and dismissed the charges out of hand. "The fact is that the charges about the conduct of [the attorneys] were and are wholly unwarranted," wrote Perry. Perry also said the withholding of the FBI documents "could not have been intentional" and added, "I am positive that it was an unavoidable error and that all of the attorneys for the agents of the FBI who participated in the case acted in good faith." In the letter, Perry contends that there was only one document in the 30,000 pages of FBI documents belatedly produced that was relevant to the case.

This view is not shared by plaintiff's attorneys, nor the Seventh Circuit, which reversed Perry's order exonerating those involved and ordered a hearing on whether sanctions should be imposed against the FBI Defendants and counsel representing them at the first trial for disobeying court orders to produce documentary materials. Judge Luther Swygert went further and stated:"It is clear that the federal defendants . . . and their counsel rather than promptly furnishing relevant documents as requested, deliberately impeded discovery and actively obstructed the judicial process, thus denying plaintiffs the fair trial to which they were entitled. Regrettably the trial judge permitted these tactics."

Perry not only exonerated the defense attornerys; he praised them. The same day Perry wrote to Kocoras, he sent a copy of the Kocoras letter to Attorney General Levi with a cover letter marked confidential. The letter concluded by saying: "All of the Attorneys and present and former Agents of the FBI mentioned in the [charges] should be complimented for their high standard of conduct in the case." Perry also noted he did not "know Senator Newhouse personally but I do know Representative Washington, who pleaded guilty [in a civil case] before me about two years ago."

The controversy over the FBI's conduct in withholding evidence continued to grow in early May, 1976, with the NAACP's Roy Wilkins calling the FBI's actions "outrageous" and "intolerable" and seeking an independent probe into the alleged federal coverup.

An outside investigation was not launched, but Kocoras, who had ties with several of the defendants, was removed from the investigation. Kocoras was replaced by assistant U.S. Attorney Stephen Kadison. Kadison did seek to interview the FBI agents involved, but apparently was told by the Criminal Division of the Justice Department that the agents could not be interviewed until after the trial ended.

Kadison then wrote the Executive Office of the U.S. Attorney saying he had been forbidden to interview the agents, and asked that he be "permitted to continue with the inquiry rather than be required to wait until the conclusion of the trial." There is no answer to this letter in the correspondence concerning the matter obtained by the plaintiffs' attorneys under the Freedom of Information Act.

Perry's letters were initially refused under the FOIA request, and were recently produced under appeal. Among them is the one addressed to Kocoras which suggests the investigation wait until the trial is over.

According to the Panther attorneys, the scenario shapes up like this: The FBI agents and their attorneys were caught withholding key evidence, and contempt and other sanctions were sought in court. The Justice Department launched a widely publicized investigation, but the presiding judge informed the investigator that the individuals charged were not guilty of wrongdoing and to wait for the end of the trial when the charges would be "disposed of." A new investigator pursued the investigation, but the Justice Department, knowing the judge would exonerate the men at the end of the trial, stalled the investigation. At the end of the trial, the judge dismissed the charges, and on the basis of this dismissal, the Justice Department dropped the investigation. The net result is that no investigation has ever taken place, and given the view of the Seventh Circuit that wrongdoing may have occurred and that a sanctions hearing should be held, the Panther lawyers are seeking an early scheduling of that hearing.

UNITED STATES DISTRICT COURT
219 SOUTH DEARBORN STREET
CHICAGO, ILLINOIS 60604

CHAMBERS OF
SENIOR JUDGE JOSEPH SAM PERRY

TEL: 431-9400
EXT. 336

May 6, 1976

CONFIDENTIAL

Mr. Charles P. Kocoras
First Assistant United States Attorney
for the Northern District of Illinois
Room 1500, United States Court House
Chicago, Illinois 60604

Re: Hampton, et al. vs. Hanrahan, et al., No. 70 C 1384 and
Assistant United States Attorney Arnold Kanter,
Assistant United States Attorney Alexandra Kwoka, and
Edward Christenbury, Special Attorney from the
Department of Justice in Washington; and
Special Agents of the Federal Bureau of Investigation:
Richard G. Held, Roy Martin Mitchell, Robert Piper
and former Special Agent Marlin Johnson.

Dear Mr. Kocoras:

A controversy arose in the captioned case when the plaintiffs filed one motion asking the court to hold the three first-named persons in contempt and another motion for sanctions against all of the above named individuals. Those motions were taken under advisement. When this case is concluded and a verdict is returned, I will dispose of them. The defendants have filed a motion to hold certain of the plaintiffs' attorneys in contempt. That motion will likewise be taken under advisement.

There are other collateral matters that can best be dealt with after the verdict. This case has been on trial for four months. I cannot take time out to hear collateral motions which can better be disposed of after verdict.

There is still another potent reason for so doing. That is the question of prejudice of the jury which is not segregated, the case being civil and not criminal. Already there has been publicity that may be harmful.

It would seem that this whole matter might very well be left to the court where it is pending.

Very truly yours,

Joseph Sam Perry

ATTACHMENT H

CHICAGO LAWYER November, 1979

Panthers demand Pell recusal in Hampton

By Chip Berlet

Attorneys in the Black Panther civil suit have filed a motion in the Seventh Circuit Court of Appeals asking that Judge Wilbur F. Pell be recused from "participation in the Court's deliberations and actions" in the case because the judge is a former FBI agent who until late 1977 was a member of the Society of Former Special Agents of the FBI.

The attorneys, all affiliated with the People's Law Office, say that Pell's relationship to the FBI and the society "is not contained in his official biography" issued to them by the court clerk's office, and that they were not aware of Pell's FBI ties until after the latest round of legal motions in the appellate court. Pell's connections have been made public, however, for example in *Who's Who in America*.

Given these relationships, the attorneys say, Pell should not have heard the recent appeal in which two appellate judges ordered a new trial in the Hampton case, while Pell dissented and issued a stinging attack on the plaintiffs and their attorneys.

The defendants in the Hampton case have already cited Pell's dissent in an attempt to have the Seventh Circuit rehear their appeal *en banc*, but this attempt failed in a tight 3-3 vote with two judges recusing themselves. The defendants have indicated that they intend to cite the dissent, and the "close" vote to rehear, in petitions for certiorari they apparently intend to file with the Supreme Court.

At one point in his dissent, Pell characterized the Hampton case as a "wide-ranging witch-hunting type of assault on public servants across the board," and complains, "Unfortunately many who decried the excesses of McCarthyism do not seem equally concerned by the development of the extremity of present day witch-hunting directed toward law enforcement officials."

Comments like these, say the Hampton attorneys, are similar to those made by defenders of FBI practices, including the Society of Former Special Agents of the FBI, which opposes prosecution of FBI agents and has been raised funds for the defense of FBI agents indicted on charges of illegal activity during operations against radical groups. The charge that law enforcement agencies acted illegally while seeking to "neutralize" the Black Panther Party is central to the plaintiffs' case.

Judge Pell was an FBI special agent from 1942 to 1945, according to the 1978-1979 edition of *Who's Who in America*, which also lists him as a member of the Society of Former Agents.

Pell has told reporters that he left the society in late 1977. Legal matters in the Hampton case were reaching the appeals court as early as May, 1975, when Pell voted on a Hampton plaintiff's petition for writ of mandamus. Pell was also a member of the society when he heard several other motions in the Hampton case, and the Hampton attorneys say his resignation came too late to avoid the appearance of a conflict of interest.

The Hampton case arose from a predawn police raid on the Chicago Black Panther headquarters the morning of December 4, 1969, which left Panther leaders Fred Hampton and Mark Clark dead and several other Panther members wounded. Revelations about the FBI's Counterintelligence program (COINTELPRO), which emphasized "neutralizing" the Black Panther Party, led the Hampton attorneys to add the FBI to the civil case.

Named as new defendants in an amended complaint filed on December 4, 1974, were Marlin Johnson, Special Agent in Charge of the Chicago FBI office at the time of the raid; special agents Robert Piper and Roy Martin Mitchell of the Chicago FBI's Racial Matters Squad; and William O'Neal, a paid FBI informant. FBI documents show that O'Neal drew a map of the floor plan of Panther headquarters, with a special notation fixing the location of the bed in which Hampton slept. This map was passed to the Chicago police, who used it in their raid. FBI memos and courtroom testimony by FBI agents show that the FBI provided substantial information which assisted in the planning for the raid, and encouraged the Chicago police to carry out the raid.

In the amended 1974 complaint, the Hampton attorneys alleged a conspiracy between the FBI and local law enforcement officials and police to illegally deprive the Panthers of their civil rights by attempting to destroy their organization, and, in the 1969 incident, killing and injuring them, then covering up the conspiracy.

The majority appellate decision, which ordered a new trial in the case, recognized that the plaintiffs had presented sufficient evidence of a conspiracy so that the case should be heard by a jury.

Given the importance of the FBI's role in the alleged conspiracy and the direct affiliation of four defendants with the FBI, the Hampton attorneys charge that Pell should have recused himself. This is especially the case because the law requires a judge to disqualify himself not only in cases of direct conflict of interest, but also in "any proceeding in which his impartiality might reasonably be questioned."

Pell's former membership in the Society of Former Special Agents of the FBI seems to be more distressing to the Hampton attorneys than his status as an ex-FBI agent.

"The Society is a powerful political organization and lobbying group, knowledgeably described as a 'civilian auxiliary of the FBI' composed of men and women 'whose devotion to former Director J. Edgar Hoover demands expression through something midway between a fan club and an organized religion,'" says the recusal brief, quoting from the book *The Private Sector* by George O'Toole.

A 1975 internal society membership list obtained by the Public Eye, a research group affiliated with the National Lawyers Guild, shows that Pell was not the only figure involved in the Hampton case who was a member of the society. The list also includes one defendant, Marlin Johnson.

Pell has told reporters that the organization is just a fraternal club. Society documents state that the original purpose of the society was "the preservation of friendship and loyalty and the promotion of good will among the members." However, this was officially changed by majority vote of the members on October 9, 1976, to include a number of other objectives, including:

"To encourage respect for our Country and its traditions and to foster its security and freedom from destructive forces, foreign or domestic;

"To seek to elevate and strengthen the public image of the good law enforcement officer as an asset to his community and the image of the good law enforcement agency as a vital force for the good of our Country;

"To serve the Nation in any emergency calling for men with FBI training and experience and complete dedication to the principles of Fidelity, Bravery and Integrity."

The Hampton attorneys claim that, as part of this "emergency" assistance, "The Society reportedly had a long-standing

agreement with the Bureau" to assist in rounding up people for "preventive political detention" under the bureau's recently revealed and discredited "Security Index" or "Agitator Index" programs.

A policy statement issued by the society's board of directors, prompted by the indictments of several former FBI officials for alleged illegal activities during investigations into the Weather Underground, outlines the group's stand on indictments against FBI agents accused of misconduct:

"We affirm that any criminal prosecution of FBI Agents for actions taken totally without criminal intent, while performing their duties with honor and determination to protect the country from criminals and subversives, is completely unwarranted...Our Society is convinced that such ill-conceived attempts to prosecute FBI employees will be regarded by the American public as abhorrent to our nation's sense of fair play and justice."

Charles H. Stanley, president of the society, confirms that the group raises funds for the defense of indicted FBI agents and has helped organize demonstrations in their support.

The society claims to have raised more than $400,000 to defend FBI agents accused of wrongdoing through its Special Agents Legal Fund.

According to Stanley, "FBI Agents should never be prosecuted for carrying out tasks assigned to them by their superiors. It's just irresponsible. That may be a bit strong, but certainly we feel the prosecution of the NY agents [involved in the Weather Underground probe] is wrong."

The Hampton attorneys call this position "morally and constitutionally dubious" and say that this defense has frequently been used by attorneys for the FBI defendants in both the trial and appellate proceedings. Further, the Hampton attorneys charge in their motion that Pell's dissent on the appeal decision "is an almost purely political statement, generally bereft of legal argument, which repeatedly mirrors and adopts the constitutionally bankrupt positions taken by the FBI defendants and the Society of Former Agents."

In his dissent, Pell excuses the COINTELPRO operations of the FBI, which have been found unconstitutional and illegal by the Justice Department, Congress and other courts, by saying, "It is doubtful that in 1969 attempts to discredit groups thought to be presenting a clear and present danger of violence was a violation of First Amendment Rights."

Pell goes on to say that he assumes law enforcement authorities at the time thought "it would be in the public good to neutralize the Black Panther Party" and that "the community would be a safer place for law abiding citizens to live and work if Fred Hampton and his cohorts were not on the scene," Pell says, "It might not be surprising if those entering the premises overreacted in view of the knowledge that they were entering as 'pigs,' some of their colleagues having been killed by a BPP member."

The Hampton attorneys charge in their motion that Judge Pell "could not have written an opinion of this character in a case with this record, unless he had embraced the purposes and goals of the Society of Former Agents and adopted the position of the Agent defendants." They go on to say that Pell's alleged conflict of interest "which appears from his background as an agent, and his membership in the Society, is confirmed by his treatment of the case in his dissent.'

The motion filed by the Hampton attorneys asks that Judge Pell recuse himself or be recused from all further proceedings in the Hampton case. Future motions could require decisions on certification of bills for fees and costs, which could be as much as $1 million for the appeal work. There are precedents granting fees to the prevailing side in civil rights cases.

Recusal alone will not satisfy the Hampton attorneys, though; they are also asking that Pell's opinion in the dissent on the appeal, and his vote for an initial hearing and re-hearing *en banc*, be with drawn or stricken from the record, an that "an appropriate addendum or not be added to the published decision of th appeal, fully setting forth the backgroun and function of the Society of Forme Agents, and the circumstances of the re cusal."

However, according to Judge Pell, th standard procedure for recusal motions i the Seventh Circuit is that they ar sub mitted to the judge being challenged. Pel said that, because the motion was pend ing, he could not discuss specific points but he did state that the"only matte pending is their claim for attorneys fees."

Pell said that his relationship with the FBI and the Society have never been se cret and that he feels free to discuss them in detail.

"I was in the FBI from August of 194 —engaged in war-related activities — un til October or November of 1945, when I left and went back into the private prac tice of law," said Pell. When he left, he joined the Society of Former Specia Agents, which he saw as an organizatio primarily for "keeping in touch" with other former members. "We would get a magazine that would say so-and-so is now doing this or that," said Pell.

"During the time I was a member, the society was not engaged in any political activities, and the entire time I was a member I attended one meeting," Pell said.

Pell said that the first indication he received that the organization was involved in political activity was a fundraising letter he received asking for donations to support the defense of the NY FBI agents indicted in the Weather Underground surveillance case. He said this letter prompted him to leave the society: "When it appeared they were getting into political activities I sent in my letter of resignation."

He concluded that, when people "don't like what someone has to say, then they smear him with this, and that's what this is."

AD HOC

Citizens' Legal Defense Fund For The FBI

Enclosed is a study of the Weatherman organization which was prepared and distributed by the Society of Former Special Agents of the Federal Bureau of Investigation to its members. Because our Fund works in close cooperation with the Society -- and its Special Agents Legal Fund -- we were given permission to give this important study even wider distribution.

Three top FBI men are now under indictment for alleged actions taken in line of duty against this terrorist organization: L. Patrick Gray III, the former acting director of the Bureau; W. Mark Felt, his number two man; and Edward S. Miller, who was chief of counter-intelligence. Through the generous participation of thousands of Americans, our Fund is helping to cover the enormous expenses required to provide these men with the best legal defense possible in order to combat the massive resources of the U.S. Government leveled against them.

ad hoc Citizens' Legal Defense Fund for the FBI
Suite 808
95 Madison Avenue
New York, NY 10016

My dear Friends:

I acknowledge receipt of your latest check in the amount of $100,000 made payable to The Special Agents Legal Fund, Inc.

The money expended on the John Kearney case, about $158,000, resulted in a tremendous victory for all of us early last year when the Justice Department's indictments were thrown out of court. But that was just the beginning. Our cash requirements now have been trebled and even quadrupled. We are covering the legal expenses of three FBI men currently fighting indictments certainly as unfair as the one brought against Kearney -- L. Patrick Gray III, the former acting director of the Bureau; W. Mark Felt, who was his number two man; and Edward S. Miller, who was chief of counter-intelligence. We also helped Wally LaPrade, former head of the Bureau's New York office, in his legal fight against his scandalous dismissal.

There are still other FBI men, both active and retired, who are being made scapegoats of the vendetta against the FBI. We see the Bureau, of which we are all so proud, being brought to its knees and almost irreparably harmed by those who would welcome weakened law enforcement and vital intelligence-gathering in our country. Never, in all its history, has the FBI been in such jeopardy. The only way we can save the Bureau is to fight for it by providing legal help for every agent threatened with legal harassment, which is the major weapon of the opposition.

We will deeply appreciate anything you can do. I thank you on behalf of all the former agents in our own organization and, I daresay, for every man and woman actively engaged in the law-enforcement and intelligence work of the FBI.....still the greatest and proudest organization of its kind in all the world.

Sincerely,

The Special Agents Legal Fund, Inc.

Chicago Sun-Times, Wednesday, May 31, 1978

A judge FBI spy at Chicago 7 trial

By David Jackson

Attorney William Kunstler charged Tuesday that William J. Campbell, former chief judge of U.S. District Court in Chicago, acted as an "FBI informant" during the Chicago 7 conspiracy trial.

Kunstler, who was the chief defense attorney during the 1969-1970 trial, showed reporters FBI documents obtained through Freedom of Information Act requests that indicated Campbell had discussed with Marlin Johnson, then the FBI's Chicago bureau chief, how he thought trial Judge Julius J. Hoffman would rule in the case.

Campbell also told Johnson he would "ensure" that a subpena seeking surveillance data, served on former FBI Director J. Edgar Hoover, would be quashed, Kunstler said, quoting another FBI document.

"I THINK it's a crime," Kunstler said of Campbell's alleged communications with the FBI. "It violates his oath of office, (and) it certainly is in contempt of court."

He said Campbell "was apparently the chief informant in the courthouse for the FBI."

Campbell, now a senior federal judge, was not available for comment. Johnson, who retired from the FBI in May, 1970 and currently is vice president of the Canteen Corp., declined to comment on Kunstler's charges.

Kunstler said other newly-released documents show that the FBI kept a "total surveillance" on the defendants and their attorneys, even during post-trial strategy meetings. He said the documents indicated that the attorneys' meetings either were infiltrated or bugged because exact comments made by the attorneys are reproduced in the confidential documents.

He said one document recorded what occurred during a March 5, 1970, conference in defense attorney Leonard Weinglass' Newark (N.J.) office, where appeal strategy was discussed. The government, Kunstler said, "knew what our strategy was going to be, who was going to do what and when."

"EVERYTHING was leaked," Kunstler said.

The first FBI document involving Campbell was a memo dated Oct. 29, 1969, from Alex Rosen, a high FBI official, to Cartha (Deke) DeLoach, described by Kunstler as the "No. 3 man in the FBI" at that time.

The memo states that Judge Campbell contacted Marlin Johnson that day before court began and "confidentially advised" him that "he believed that U.S. District Court Judge Julius J. Hoffman, who is conducting the trial, had 'had enough' of the conduct of the defendants, and that it was possible that Judge Hoffman might today hold the eight defendants as being in contempt of court, as well as some of the attorneys, and sentence them to jail."

Despite Campbell's warning, Hoffman did not do so that day.

A second memo displayed by Kunstler, who met reporters at O'Hare Airport during a stopover between flights, concerned a subpena served on Hoover seeking records of surveillance of the defendants and their attorneys. The subpena was served on Hoover on Dec. 2, 1969. The memo, dated Dec. 3, 1969, also was from Rosen to DeLoach.

IN IT, Rosen reported that Campbell had said he "will insure that the subpena is quashed." The subpena later was quashed by Hoffman.

Defendant Jerry Rubin, who is writing a book, obtained both memos through Freedom of Information Act requests, Kunstler said.

Kunstler also said that he misplaced his address book during the trial, but a Jan. 5, 1970 FBI document indicates that the FBI had it and the names of witnesses, attorneys and others listed inside it.

He said the new information showed that judges and the government—rather than the defendants and their attorneys, as some have claimed—made a "circus" of the lengthy trial. "No process of the judicial procedure was left untrammelled. . . . To me, it's an unparalleled perversion of the legal process," Kunstler said.

The defendants and their lawyers were charged with more than a dozen citations of contempt. Kunstler said he would file a motion to have the records of the contempt actions expunged and that he was considering suing Campbell, former U.S. Atty. Thomas Foran, the prosecutor, and Hoffman, among others, for damages.

Friday, December 28, 1979 DAILY LAW BULLETIN—3

Ten years later, "Chicago Seven" attorney William Kunstler is still charging that the real conspiracy involved in that trial included the judge, prosecutors and the FBI.

In documents made public Thursday, Kunstler's federal court motion claimed that evidence indicates the FBI forged threatening letters purportedly written by the Black Panthers to prospective jurors who might have been sympathetic to the defendants. He bases his charge on an FBI memo he obtained through the Freedom of Information Act. The memo reportedly says that U.S. District Judge Julius Hoffman concurred with an FBI order not to investigate the letters without permission from top agency officials. Kunstler is trying to overturn contempt of court convictions against the defendants.

FBI used black judge to discredit Muslims

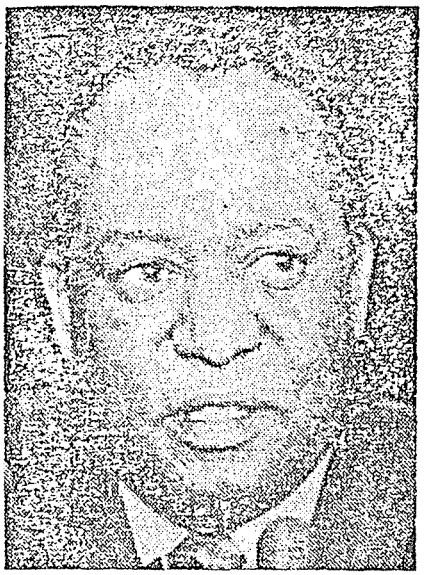
By Rob Warden

CHIEF JUDGE James B. Parsons of U.S. District Court was "utilized" by the FBI in a counterintelligence program to discredit the Black Muslims in the 1960s, according to bureau documents obtained by The Tribune.

The documents, released under the U.S. Freedom of Information Act, are memos to the late FBI Director J. Edgar Hoover from Marlin W. Johnson, special agent in charge of the bureau's Chicago office at the time.

The memos say Parsons, at FBI's behest, repeatedly criticized the Black Muslims, then known as the Nation of Islam, as racist and violent.

Parsons, 66, the first black ever named to the federal bench, denied Thursday that the FBI asked him to make the statements.



Judge James Parsons

"IT IS TRUE that I sought information about the Muslims from the FBI and that there were occasions quite early in the '60s when I was critical of the Muslim movement, but under no circumstances did the FBI ever ask me to speak," he said.

One of the memos, dated Jan. 22, 1969, says in part: "Over the years considerable thought has been given, and action taken with bureau approval, relating to methods through which the NOI [Nation of Islam] could be discredited in the eyes of the general black populace or through which factionalism among the leadership could be created.

"Factional disputes have been developed—the most noteable [sic] being Malcolm X Little. Prominent black personages have publicly and nationally spoken out against the group—U.S. District Court Judge James Benton Parsons being one example.

"Chicago, as the bureau is aware, has always been on the alert for methods by which the NOI could be directed or disrupted. As is evidenced by the present co-operation with Parsons this policy continues."

ANOTHER MEMO, dated Dec. 12, 1968, says that "Chicago continues to maintain periodic contact" with Parsons, who was "approved by the bureau for counterintelligence usage sometime ago."

Parsons, the memo adds, "will certainly continue to speak out in such fashion and the contact by Chicago productive of such will continue."

A third memo, dated Aug. 29, 1969, says that "several years ago Chicago utilized a local federal judge to speak out against the NOI. He has not been utilized in this regard since the murder of Malcolm X Little as it was not the bureau's desire to involve him in a name-calling contest."

Parsons, interviewed by telephone in Delavan, Wis., where he was attending a judicial conference Thursday, said he has "no reaction" to the statements in the memos. "To me the language 'utilized' is understandable, but from a public standpoint it will not be understood.

"I think the documents reflect the fact that I had been threatened back in '63 by the Muslims. I was anxious to be constantly informed about them, and I had a complete FBI file on them. At no time did anybody ask me to speak out against or use my influence against anyone. I am responsible for what I said."

THE THREAT, Parsons said, "was that I was to be physically disciplined."

He said the threat was not made directly to him, but that he learned about it from the FBI. "Frankly, I was quite frightened when it occurred," he said.

He said his view of the Muslims has changed and he no longer criticizes them.

Chicago Tribune, Friday, April 28, 1978

Bell curbed probe of FBI, task force leader charges

WASHINGTON [AP]—Atty. Gen. Griffin Bell undermined the Justice Department's investigation of the FBI and blocked possible indictments against eight middle-level FBI officials, the man who led the probe said Thursday.

William L. Gardner told a Senate appropriations subcommittee that Bell effectively halted the investigation by refusing to let prosecutors seek perjury indictments against an unspecified number of FBI officials who the task force believed were lying.

Without the threat of perjury charges, Gardner said, his task force had no leverage with which to force agents to tell the truth about allegedly illegal FBI activities.

GARDNER SAID BELL also refused to let prosecutors seek indictments of eight mid-level officials on charges of wiretapping, mail theft, break-ins or black bag jobs, perjury, and false statements to a government agency.

He said the officials, some of whom still work for the FBI, include three squad leaders, four special agents in charge of divisions and one assistant director.

Gardner did not name any of the officials. He resigned as head of the task force in December but remained as head of the criminal section of the department's civil rights division.

Bell, out of town until Monday, had no immediate comment. But an aide, Terence B. Adamson, said the attorney general stands by his handling of the case and does not want to get into a debate with the task force lawyers.

ADAMSON described Bell's philosophical framework for prosecuting the so-called black-bag abuses as "giving the highest priority to those with the greatest degree of culpability." Adamson said that Bell "was handed a difficult task when he arrived" and that "he gave it his full attention and best efforts, and he did his duty as he saw it."

Adamson said FBI officials and employes are still subject to disciplinary procedures for any role they may have had in the allegedly illegal surveillance activities.

Gardner testified that the task force not only learned that FBI agents were involved in burglaries but also turned up a class in breaking and entering that was given by a "guest lecturer" at the FBI training academy in Quantico, Va.

ANOTHER FORMER member of the task force, Stephen Horn, told the subcommittee that Bell pleaded with an FBI official to recant his testimony after the task force told the attorney general it wanted to indict the official for perjury.

"He told him he did not want to prosecute him because he was an FBI agent," Horn said of Bell. "He said it would be a disgrace to the FBI."

The statements by Gardner and Horn, and by two other task force members who resigned last year after a dispute with Bell, prompted Sen. Lowell Weicker [R., Conn.] to question Bell's fitness for office.

"It seems clear that the attorney general, despite the advice of top Justice Department prosecutors, willfully selected not to pursue a complete investigation," Weicker said. "What has transpired here this morning rightfully calls into question the suitability of Griffin Bell to continue as attorney general of the United States."

HOWEVER, SEN. Ernest Hollings [D., S.C.] said such talk was "sanctimonious" and said what really was at issue was that Bell and his subordinates disagreed on how to proceed with a difficult investigation.

Gardner said that when his task force recommended indictments of eight officials, four of them no longer were with the bureau, and four still worked at the FBI.

He said Bell objected to indicting so many agents and that the attorney general said several times that "he had to manage the bureau but couldn't do it with their officials on trial so often."

BELL EVENTUALLY decided, Gardner said, to indict only one man, John J. Kearney, the former director of the FBI bureau in New York.

Since then, the Justice Department has dropped that indictment and has announced indictments against former Acting FBI Director L. Patrick Gray III and two other executive-level FBI officials on charges resulting from allegedly illegal break-ins ordered by the agency in the early 1970s.

Gray has pleaded innocent to the charges, as did the other two defendants —W. Mark Felt, a former acting associate director, and Edward S. Miller, a former assistant director of the domestic intelligence division.

Bell also has taken administrative action against another FBI executive, J. Wallace LaPrade, until recently head of the FBI's New York office.

GARDNER TESTIFIED that Benjamin Civiletti, then head of the department's criminal division, agreed in an April 2, 1977, meeting that the eight cases should be presented for grand jury indictment.

Gardner also testified that the nature and extent of recent intelligence agency abuses were hidden from Congress and that the Senate committee investigation headed by Sen. Frank Church [D., Idaho] was deceived.

SEVEN DAYS SPECIAL REPORT 5/7/78

(Second of Two Parts)

Inside the FBI

FBI Informers Beg, Borrow and Steal

This has been a bad month for the FBI. First, three top FBI officials—former Acting Director L. Patrick Gray, 3d, former Acting Associate Director W. Mark Felt, and the former chief of the Bureau's counterintelligence section, Edward S. Miller—were indicted by a Federal grand jury for conspiring to violate the civil rights of American citizens by ordering agents to break into their homes without warrants. The break-ins cited in the indictment occurred in late 1972 and early 1973 in New York City and Union City, New Jersey, against friends and relatives of Weather Underground fugitives.

Attorney General Griffin B. Bell also asked current FBI director William H. Webster to subject 68 FBI agents to administrative discipline for their role in the illegal entries. Such action could result in dismissal.

On April 13, three days later, J. Wallace LaPrade, chief of the FBI's New York office and an unindicted co-conspirator in the government's case, was transferred to Washington to answer Justice Department charges stemming from the same investigation.

LaPrade, a 27-year veteran of the FBI, lashed out at Bell, charging that illegal searches and surveillances continued under the Ford and Carter Administrations and are continuing today. William Safire in *The New York Times* alluded to two specific cases LaPrade might have had in mind. These, in addition to the elaborate surveillance undertaken in the current "spy" case of Ronald Humphrey and Truong Dinh Hung suggest that current indictments are merely a cover for continuing illegal surveillance. Some sources even go so far as to suggest that the Justice Department's decision to zero in on the FBI's Weather Underground investigations offers the FBI defendants an easy out, as they can claim their activities fell into the national security loophole. Recent allegations that the Weather Underground was in contact with the PLO indicate that this may be the case.

At the same time that these unprecedented indictments were being handed down, charges were dropped against John J. Kearney, a lower-level FBI official who had been under indictment for illegal wiretapping and mail openings. Bell said he dropped charges against Kearney after William C. Sullivan, former FBI number three man, testified that in 1970 J. Edgar Hoover had ordered him to urge Kearney to employ illegal measures against the Weather Underground.

If Kearney had gone to trial, it is believed Sullivan would have testified on his behalf. Sullivan also was reported to have been the key witness against Gray, Felt and Miller. He was a defendant in several multi-million dollar civil suits against the FBI and it was known that he intended to cooperate with the prosecution. A number of people, therefore, had good reasons for wanting Sullivan out of the way. Last year, shortly after he testified for nine hours before a grand jury investigating the FBI, he was shot in what was described as a hunting accident near his home in New Hampshire.

Attorney William Kunstler recently charged that Sullivan was murdered and called for a full investigation, citing a number of suspicious circumstances surrounding his death. According to Kunstler, Sullivan was shot 15 minutes before sunrise at 243 feet with a sniper rifle equipped with a scope that magnified objects three to four times their normal size. The killer, Robert Daniels, is the son of a state trooper and, says Kunstler, an expert hunter.

He allegedly mistook Sullivan, attired in a black and white mackinaw and white turtleneck sweater, for the white tail of a deer. According to officials who examined the body, however, Sullivan was wearing a black and red mackinaw. The only white item of clothing they found was a T-shirt entirely covered by outer garments. The autopsy report has the fatal bullet traveling in a downward path through Sullivan's body until deflected upwards by vertebrae, while the killer said he shot upwards over the brow of a hill.

The FBI did not investigate at the time of the shooting. "It was a local matter," says FBI press officer Tom Deakin. "We didn't see any reason to investigate then and we find no reason now."

Kunstler's charges are potentially the most explosive of all and could have extremely serious consequences for the FBI, dwarfing the current flap over illegal entries, wiretaps and mail openings. Here is Part II of Dave Dellinger's interview with a former FBI agent who sheds some light on the kinds of activities that led to the grand jury indictments against the three top FBI officials. *Peter Biskind*

Since initiated in 1956, the Counterintelligence Program (Cointelpro), directed against the Communist Party, USA (CPUSA), and related organizations, through a variety of techniques has disrupted, exposed and neutralized the communists. Some successful Cointelpro operations such as anonymous letters and mailings, in spite of their simplicity, have caused unexpected consternation and disruption among the comrades. Cointelpro-initiated publicity has been a tremendous deterrent to the comrades, while at the same time it has alerted the general public to their insidious maneuvers. More sophisticated techniques and operations have caused defections and expulsions within Party ranks. (U)

Over the years, our approach to investigative problems in the intelligence field has given rise to a number of new programs, some of which have been most revolutionary, and it can be presumed that with a continued aggressive approach to these problems, new and productive ideas will be forthcoming. These ideas will not be increased in number or improved upon from the standpoint of accomplishments merely through the institution of a program such as COINTELPRO which is given another name, and which, in fact, only encompasses everything that has been done in the past or will be done in the future. 13. ABSTRACT (maximum 200 words)

This thesis explores the history of U.S. Army deception and doctrine, and combines the insights gained with the various works on deception, cognitive psychology, communications, and decision-making in order to distill a concise handbook for deception practitioners. A longitudinal review of U.S. Army doctrine reveals a wide variation in the treatment of deception, from emphasized to ignored. This variation can be primarily explained by the U.S. preference for the cumulative destruction style of war and the perceived balance of power between the U.S. and its adversaries. This thesis strives to fill the current doctrinal gap by distilling the existing body of work to create a theory of deception in the military context. The theory presented provides a cogent structure, taxonomy, and lexicon; as well as, emphasis on how deception functions within the frameworks of communications and decision-making. Next, a synthesis of the practice of deception is presented, with a focus on deception planning and the essential elements of deception practice. Examples of U.S. use of deception from the Revolutionary War to Operation DESERT STORM are presented to provide illumination on the utility and use of deception. Finally, the thesis provides recommendations on how to organize for deception operations.

ACKNOWLEDGMENTS

I would like to thank the faculty and staff of the Defense Analysis Department for providing this amazing experience. I am humbled by the collective knowledge and experience in this department. I would also like to thank Dr. Hy Rothstein and Dr. Kalev Sepp for their invaluable mentorship and advice, without which I would not have been able to complete this thesis. Thanks also to Zooey Lober and the rest of the hard-working and patient personnel at the Dudley Knox Library Interlibrary Loan desk for their tireless efforts in finding my esoteric, and often quixotic, requests. Additionally, I thank the myriad organizations who responded to my plaintive information requests, especially the folks at the United States Army Military History Institute. To my fellow students, thanks for the prodding and cajoling to tackle this topic, and for the opportunity to interact and learn from you. Finally, I have to thank my lovely wife, Christy, whose patient support and faith, both in this endeavor and my career, have been invaluable.

I. INTRODUCTION

> *For where the lion's skin will not reach, you must patch it out with the fox's.*
>
> *– Lysander the Spartan*[1]

During the opening phases of the 2006 Israeli-Hezbollah War, Israeli Defense Forces (IDF) hammered the network of Hezbollah bunkers along the Lebanese border. Hezbollah had been building the bunker network for years, under the watchful eyes of IDF surveillance, Lebanese spies working for Israel, and the United Nations Interim Force in Lebanon (UNIFIL), patrolled the southern Lebanese border. What the IDF did not realize until far too late was the network of bunkers so diligently—and visibly—emplaced by Hezbollah were decoys; Hezbollah's true bunkers were scattered across the countryside and covered by layers of security and camouflage. The bunker deception was but one of several cunning stratagems used by Hezbollah to blunt the IDF's technological and information advantages, allowing Hezbollah to maintain combat effectiveness in the face of the Israeli assault. Deception had once more proven its worth.[2]

A. BACKGROUND

Stratagems are essential in war, as commanders seek to hide their real intentions, capabilities, and actions from the enemy, while cunningly showing false intentions capabilities and actions to lure the enemy into defeat. From the earliest battles of antiquity, commanders have used guile and misdirection for tactical, operational, and strategic effect. Hannibal at Cannae, the Greeks' use of the Trojan Horse, and Gideon's raid on the Midianites are but a few examples of successful deception in the ancient world. Operations OVERLORD and BARBAROSA during WWII, British pseudo-operations

during the Mau-Mau insurgency in Kenya, and Hezbollah's use of deception against Israel during the 2006 war demonstrate the continuing utility of deception in the modern era.

Even within the more limited scope of U.S. Army history, deception has played an important role. General Washington utilized numerous stratagems to great effect during the Revolutionary war, including deceiving the British about the status of his forces at Valley Forge to deter attack, and later about his intentions to attack New York, setting the stage for the final showdown at Yorktown. During the Civil War, Confederate General Magruder used decoy cannons made of nothing more than painted tree trunks to hold Union forces in check for months after the First Battle of Manassas. General Pershing deceived the Germans about his intentions in order to gain surprise for the assault on the St. Michel salient during World War I.[3] U.S. use of deception reached a plateau during World War II. After a slow start, the U.S. Army became adept at using deception and by 1947 Chief of Staff of the Army, General Eisenhower [in a 1947 memo to the Lauris Norstad, Director, Plans and Operations Division] stated:

> …no major operations should be undertaken without planning and executing appropriate deception measures. As time goes on… there is a danger that these two means [psychological warfare and cover and deception] may in the future not be considered adequately in our planning. I consider it essential that the War Department should continue to take those steps that are necessary to keep alive the arts of… cover and deception and that there should continue in being a nucleus of personnel capable in handling these arts in case an emergency arises. I desire therefore that the Director of Plans and Operations maintain the potential effectiveness of these arts in order that their benefits may become immediately available, as and when desired, in furtherance of national security.[4]

During Vietnam, the Military Assistance Command Vietnam—Studies and Observation Group [MACVSOG] made extensive use of deception in its operations against

[3] Richard Baker, "The Lost and found Art of Deception" (Paper presented at the Conference of Army Historians, Arlington, Virginia, 25 – 28 July 2011).

North Vietnam. During Operation DESERT STORM, U.S. forces deceived Saddam's forces into believing the assault into Kuwait would come from the sea, and not from the now famous "left hook."

In spite of the demonstrated utility of deception in support U.S. military operations, the U.S. Army currently falls short on the requirement to provide practitioners of deception with a solid doctrinal foundation in the theory and practice of deception. Instead, the U.S. Army has for the most part of two decades done little more than pay lip service to the importance of deception, or in the case of camouflage and concealment, stripped the concepts of their deception lineage. The last dedicated deception manual was published in 1988, and is no longer available through official channels. Furthermore, the 1957 and 1967 editions of the deception field manual have effectively disappeared.[5] Current U.S. Army doctrine, discounting uses of the word "deception" as a buzzword, is limited to a 30-page section in the information operations field manual that completely ignores essential tenets of deception like perceptual and cognitive biases. There is a need for a concise distillation of theory and practice for the military practitioners of deception.

B. HYPOTHESES

The degree of emphasis of deception in U.S. Army doctrine is primarily related to the perceived balance of power between the United States and potential adversaries.

There are essential tenets of the theory and practice of deception that can be drawn from the existing bodies of work.

C. SCOPE AND SIGNIFICANCE

What the literature review shows is there is a definite lack of guidance on the theory and practice of deception within current U.S. Army doctrine, despite a continuing theme in the doctrine that deception is of utility to operations. On the civilian side, there is a diversity of ideas on the theory and practice of deception; however, these ideas are

[5] The author's quest to find these manuals has included contacting each service academy and war college, all the proponents for deception; as well as, the U.S. Army Military History Institute, and the National Archives. These requests were in addition to the tireless and patient work of the Dudley Knox Library Staff. The vanishing of *FM 31-40* is indicative of the U.S. Army's habit of purging "obsolete" doctrine; a habit that perhaps merits its own thesis on the value of institutional knowledge.

dispersed over a large body of work. What is lacking in the civilian literature is an equivalent to the Grand Unification Theory in Physics, one work that distills the breadth and depth of the deception field into a usable synthesis. While not being so presumptuous as to present a Grand Unification Theory of deception, this thesis will bridge the gap in U.S. Army doctrine by creating a petite military deception focused synthesis of the body of deception work. This work is not intended to be proscriptive or all-inclusive; rather, the goal of the work is to provide commanders and practitioners a framework of concepts and ideas which can be altered to fit their organizational and operational needs. Central to this thesis is a reunification of cover with deception, as cover and active deception are mutually supporting concepts. The creation of an unclassified deception handbook will fill a doctrinal void and hopefully increase the perceived utility of deception within the force.

D. METHODOLOGY

The purpose of this thesis is to explore the breadth of U.S. Army military deception history and doctrine, and combine the insights gained with the various works on deception theory and practice, cognitive psychology, communications, and decision-making in order to distill the theory and practice of deception into a concise handbook for deception practitioners. Rather than attempting to cover the entirety of deceptive practices, the scope of this thesis is deception as employed in support of military objectives.

In order to achieve this goal, the thesis first constructs a longitudinal review of U.S. Army doctrine focusing on the capstone operations manual series and deception related manuals in order to discern whether there is a pattern to U.S. Army doctrine's treatment of deception. The scope of this survey is from the 1905 *Field Service Regualtions* through the 2012 *ADP 3-0*. Next the thesis examines the reasons commonly given for why deception is marginalized within military affairs. This examination is conducted through the lenses of doctrine and practice.

Then the thesis shifts to a distillation of the existing body work on deception to create a theory of deception in the military context. Within the theory of deception

chapter the focus will be on providing a cogent structure, taxonomy, and lexicon for deception with an emphasis on how deception works. The structure provided by Bell and Whaley's general theory of deception will be used as the initial framework. To the framework is added an understanding of the role of perceptional and cognitive biases in deception; a fleshed out lexicon of deception related terms; and a broad set of categories for deception techniques. This requires taking the mélange of existing works on deception and rendering the concepts down to a cohesive synthesis.

After deception theory, the thesis presents a synthesis of the practice of deception. The practice of deception chapter first presents a planning process that builds upon the planning process presented in *JP 3-13.4: Military Deception*. Next, the chapter reviews the various maxims, principles, and considerations presented by deception theorists and practitioners to draw out the essential elements of deception practice. Additionally, the chapter examines the uses of deception in war illuminated with examples from history. The practice chapter ends with a discussion of deception failures in order to reinforce the necessity of proper planning and execution.

A chapter surveying U.S. military use of deception from the Revolutionary War to Operation DESERT STORM follows the practice chapter in order to provide additional illumination in the context of historic U.S. operations. This chapter serves a secondary purpose of priming the mind of the reader by demonstrating the U.S. military has a long and storied history of using deception. Finally, a conclusions chapter provides recommendations on how to organize for deception operations, with ideas on manning, training, integration in the staff, and special resource requirements.

II. DECEPTION IN U.S. ARMY DOCTRINE

Deception is common sense soldiering.

– General Carl E. Vuono[6]

According to *FM 1, The Army*, "Doctrine is the concise expression of how Army forces contribute to campaigns, major operations, battles, and engagements."[7] Furthermore, doctrine creates a shared culture for the force; standardizes operations; and provides a common frame of reference.[8] Thus any attempt to understand the role of deception within the U.S. Army must begin with an examination of U.S. Army doctrine. The U.S. Army has two capstone manuals that serve as the doctrinal foundations of the force; currently, these manuals are: *FM 1: the Army* and *APD 3-0: Unified Land Operations*.[9] *FM 1* serves as a broad overview of the U.S. Army's "fundamental purpose, roles, responsibilities, and functions, as established by the Constitution, Congress, and the Department of Defense."[10] *APD 3-0* serves as the "overarching doctrinal guidance and direction for conducting operations."[11] In addition to these capstone documents, it is necessary to examine other doctrine publications directly related to the various aspects of deception. Each of these manuals in its various incarnations over time plays a vital role in setting the conditions for the role, or lack of a role, of deception in U.S. Army operations.

The adjectives best describing the U.S. Army's historical and present guidance on deception are haphazard and shallow. Within the operations field manuals are statements to "use deception" sprinkled about almost as an afterthought. Only rarely are any statements approaching the strength of General Eisenhower's about the essential

importance of deceptions in every operation. Discussion of how deception works is either missing or disregarded. For example, in *FM 3-13*, the section on exploiting target biases states that the target's biases can be "the most powerful weapon in the MD [military deception] planner's arsenal;" however the very next sentence obliterates the importance of the target's biases with "However, such information is not essential to preparing a viable MD plan."[12]

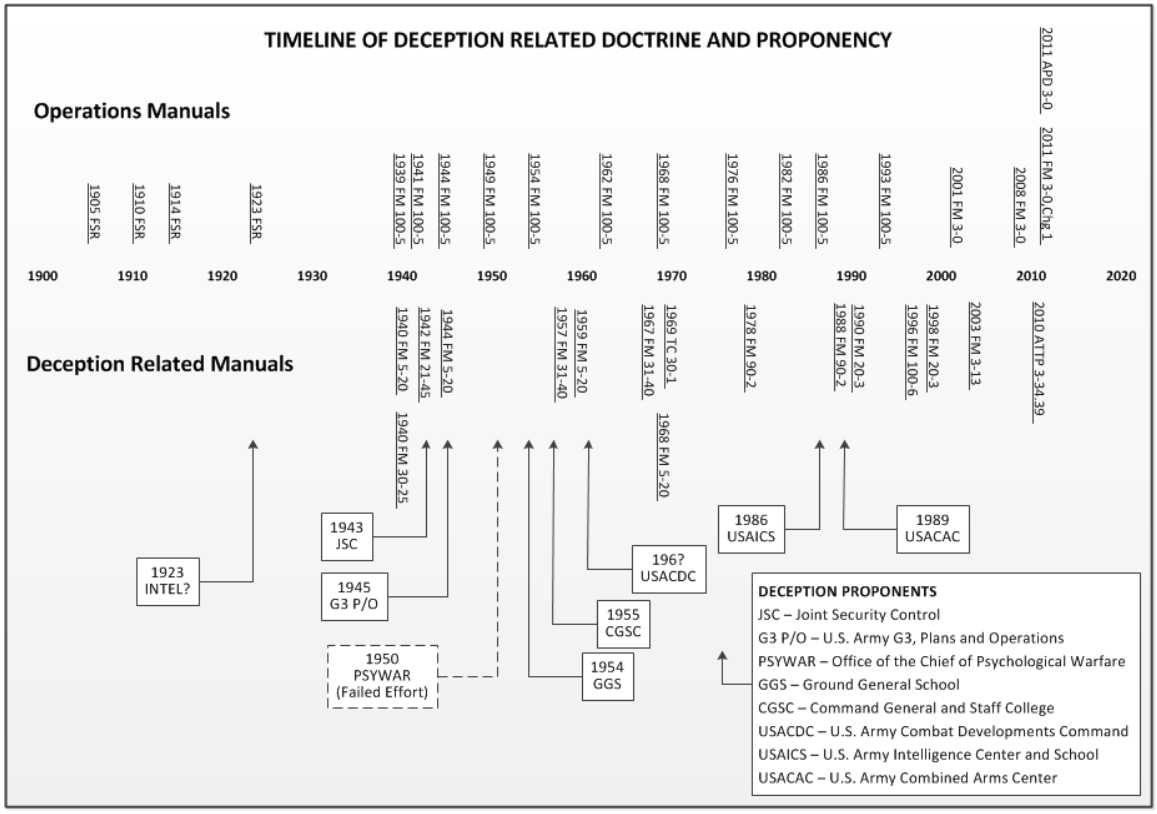

Figure 1. Timeline of Deception-Related Doctrine and Deception Proponents from 1905–2011

A. PRE-WORLD WAR II ERA

Discussion of the concept of deception in U.S. military doctrine prior to the World War II era was minimal, and when present often negative. The 1905 edition of the War Department's *Field Service Regulations* admonishes there will be no quarter

[12] Headquarters, Department of the Army, *Field Manual 3-13: Information Operations: Doctrine, Tactics, Techniques, and Procedures* (Department of the Army, 2003), 4-9.

Page 720 of 3957

expected for troops utilizing the enemy's uniform for "treacherous advantage," and advised commanders forced to use pieces of the enemy's uniform in extremis to maintain sufficient difference from the enemy's ensemble so as to avoid the charge of willful deception.[13] Where concealment is discussed, it is almost purely in association with force protection, with only one mention of concealing trench works in the defense to set the stage for an "ambuscade."[14] The 1910 edition eliminates much of the discussion on perfidy and wrongful deception, and increases the mentions of surprise and concealment. However, discussion of deceiving the enemy is limited to cryptic comments like: "If it is desirable to annoy or deceive the enemy, the supreme commander gives the necessary orders."[15] In the 1914 edition of *Field Service Regulations* the main discussion of surprise is in the context of an imperative to not be surprised.[16] While the term deception is not used in the manual, deceiving the enemy is given as a primary purpose for holding attacks.[17] Amusingly, the other major reference on the topic of deception occurs in the guidance on war correspondents.[18]

The 1923 edition breaks from the preceding editions, representing the hard learned lessons of World War I. The manual introduces the concept of counterinformation, that is, the measures designed to prevent the adversary from gaining information on friendly capabilities, dispositions, and plans. Counterinformation effectively constitutes the deception principle of hiding the real. Of particular note is the value placed on camouflage throughout the manual. In addition to efforts to deny information, counterinformation is supported by means designed to mislead or deceive

[13] War Department, *Field Service Regulations, United States Army. 1905, with Amendments to 1908* (Washington, DC: Government Printing Office, 1908), 200; This is possibly a reaction to the backlash against Colonel Funston's use of enemy uniforms during the Philippine Insurrection.

the enemy.[19] In a complete reversal from the 1914 manual, surprise is now presented as vital to all combat actions, with feints and demonstrations presented as ways of gaining surprise.[20] Furthermore, surprise and deception are considered essential to the successful execution certain operations, e.g., river crossings.[21] While still insignificant in the context of the entirety of the manual, the inclusion of deception concepts indicates some lessons learned during World War I, such as General Pershing's use of deception during the offensive against the Saint Mihiel salient, were taken to heart.[22]

B. WORLD WAR II ERA

The intriguing anomaly in U.S. military doctrine prior to and during the World War II era is the presence of the concept of deception. Though cursory, the inclusion of both the covering and deceiving aspects of deception within U.S. doctrine runs counter to the prevailing conventional wisdom that the U.S. military was a deception neophyte until the capability was nurtured under the tutelage of its British counterparts. Building on the 1923 *Field Service Regulations*, the 1939 operations manual, now *FM 100-5: Tentative Field Service Regulations: Operations*, establishes deception's role in support of surprise, stating: "The effect of surprise is dependent on… the effectiveness of the means employed to deceive the enemy of our own dispositions and intentions."[23] The cover aspect of deception remains incorporated in the section on counterinformation, or "…measures taken to prevent the enemy from gaining information relative to our dispositions, movements, and plans."[24] Additionally, active deception becomes more strongly tied to counterinformation, with the manual stating: "Counterinformation is supplemented by positive measures designed to deceive or mislead the enemy as to our dispositions and intentions;" however, while counterinformation is provided a page and a

[24] War Department, *Field Manual 100-5: Tentative Field Service Regulations*, 41.

half, the "postive measures" are not described in any detail.[25] Interestingly, within the types of operations, deception—again without detail—is only mentioned in the section on guerrilla warfare, as if this is the only appropriate time. Here, the manual states:

> The *attack* [emphasis in original] on the enemy is made by surprise obtained by deception and ambush…. By feint and demonstration… by spreading false information, the attacker attempts to mislead the enemy….[26]

In the 1941 edition, now *FM 100-5: Field Service Regulations*, the term counterinformation is replaced by counterintelligence. The set of tasks bundled under the aegis of counterintelligence includes: counterespionage, cover, measures designed to deceive the enemy, counterpropaganda, and censorship.[27] Thus active deception completes the integration into counterintelligence started in preceding editions. The counterintelligence section includes three paragraphs on active deception, and includes a prompt designed to spur the egos of commanders: "A commander who is ingenious and resourceful in the use of tactical stratagems [*sic*] and ruses often will find methods of deceiving or misleading the enemy and of concealing his own intentions."[28] Of note is the inclusion of several examples of deception techniques: e.g., feints, demonstrations, fake concentrations, and dummies. However, the section also includes a combined warning and constraint that since deception creates the danger of misleading one's own forces: "Such measures may be adopted only by the theater commander or by his authority."[29] Throughout the manual, deception is integrated into discussions on the various types of operations; such as, the use of simulated activities by screening forces to facilitate a retrograde maneuver, and the use of feints during mountain operations.[30] Despite the incorporation of deception across the manual, there are two notable

inconsistencies. First in a curious change from the 1939 manual, the section on partisan warfare, which replaces the 1939 section on guerrilla warfare, is devoid of deception. Second, in opposition to the overall tenor of deception as a useful tool, the manual seems to undercut the utility of deception in the offense stating:

> The degree of surprise attained is dependent in a large measure on the coordination and timing of the measures taken to deceive the enemy. Ruses, demonstrations, feints, and other measures for deception executed at the wrong time and place will be obvious to an alert enemy and will warn him of the impending attack. Superior mobility and speed of execution may be determining factors in achieving surprise.[31]

In addition to the operations manual, during this period there were several other manuals directed related to deception. *FM 30-25: Basic Field Manual of Military Intelligence Counterintelligence* expands the guidance of *FM 100-5* with sections on each of the aspects of counterintelligence. Though the section on tactical measures—feints, demonstrations, and ruses—is unfortunately a verbatim repeat of the section in *FM 100-5*, the counterintelligence manual is a de facto deception manual as it provides in depth detail on the cover aspects of concealment and denial through the manual's emphasis on depriving the enemy access to friendly information. In keeping with the constraint imposed by *FM 100-5*, while the manual encourages commanders to embrace most aspects of deception, false information—e.g., the deliberate loss of notional orders—is restricted to the discretion of the theater commander out of the risk that friendly plans will act on the assumption the enemy has been deceived.

FM 21-45: Basic Field Manual of Protective Measures, Individuals and Small Units, published in 1942, provides further guidance on concealment at the Soldier and unit levels; as well as, reinforcement of the vital necessity to protect military information. Notably, *FM 21-45* sets more stringent guidance for protecting information than current doctrine; for example, the manual states:

> Prior to going into combat, all distinguishing marks and insignia on vehicles, equipment, or persons will be removed or obliterated under an officer's supervision. You must be careful to remove divisional, regimental, or company insignia from your clothes and equipment. Search

[31] War Department, *Field Manual 100-5: Field Service Regulations, 1941*, 109.

> your pockets for letters, memoranda, orders, souvenirs, or keepsakes which might disclose your organization.[32]

Additionally, while cover at this time is coupled with deception, the War Department and later the U.S. Army have published a separate manual for camouflage since at least 1940. Despite being treated separately from cover and deception, camouflage was intrinsically linked to both concepts until the late 1960s. The 1940 edition of *FM 5-20: Engineer Field Manual, Camouflage* lists three methods of camouflage: hiding, blending and deceiving.[33] The 1944 edition expands upon the theme of camouflage and deception, devoting an entire chapter to the subject of deceiving camouflage.[34] Furthermore, the 1944 edition states:

> Camouflage uses concealment and deception to promote our offensive action, to surprise, to mislead the enemy, and to prevent him from inflicting damage upon us. Concealment includes hiding from view, making hard to see clearly, arranging obstructions to vision, deceiving and disguising, and deception involving sound.[35]

C. POST WORLD WAR II THROUGH VIETNAM

While the 1944 edition of *FM 100-5* is essentially the same as the 1941 edition, the 1949 edition of *FM 100-5* differs in two critical ways with regards to deception. First, this edition of the operations manual introduces a distinct set of principles of war, with surprise being one.[36] Second, though counterintelligence continues to include means to deceive the enemy, the separate paragraphs on deception present in the two previous editions are absent.[37] The separation of deception from counterintelligence possibly reflects the shift of deception proponency from the Joint Security Control to the Army

G3, Plans and Operations Division. The lack of detail on the execution of deception is perhaps best explained by a training memorandum from the Office of the Chief of Army Field Forces to the commanders of the Armor, Infantry, and Artillery Centers. This declassified memorandum reveals the intent of the Army to keep the lessons learned from World War II well under wraps: "The security classification of this whole subject [strategic cover and deception] is and probably will remain TOP SECRET…."[38]

In 1950, Brigadier General McClure campaigned for the establishment of a psychological warfare division within the Department of Army Special Staff. This division was to have purview over psychological operations, cover and deception, and unconventional warfare; however, when the Office of the Chief of Psychological Warfare was established in 1951, cover and deception were not included in the scope of the office's operations.[39] In 1954, proponency for deception was assigned to the Ground General School, specifically to the Aggressor Center at Fort Riley, Kansas.[40] This decision was the General Staff's halfhearted response to a request from the Commander, Army Field Forces for a purpose built unit trained in deception along the lines of the 23rd Headquarters Special Troops in World War II.[41] The decision to place deception under the Aggressor Center given the Aggressor Center's role as a professional opposing force seems to demonstrate how quickly the Army drifted from General Eisenhower's admonishment.

The 1954 edition of *FM 100-5* represents another fundamental revision of the manual; as well as, both the apex of discussion of deception activities within the capstone document and the beginnings of deception's dismemberment. This iteration of *FM 100-5*

separates active deception from counterintelligence into a distinct three page section on "combat deception" that includes subsections on the importance of military deception; the fundamentals of military deception; security considerations; planning; and means. The manual advises: "It is imperative that commanders constantly realize the importance of combat deception and that they train their troops and staff in the techniques and planning for combat deception."[42] Though the split of deception from counterintelligence elevates the status of deception within the manual, the split has the negative effect of separating deception from the security aspects of cover. Furthermore, while deception is still considered a tool of surprise, a new principle of war, economy of force, admonishes that deception—along with limited attacks, retrogrades, and the defense—is only to be used in non-critical areas in support of the concentration of forces at the decisive point.[43] This admonishment runs counter to deception's economy of force role, and could only serve to dissuade the use of deception.

In 1955, the Ground General School was discontinued and deception proponency was transferred along with the aggressor cadre to the Command and General Staff College.[44] In 1957, the U.S. Army published a field manual dedicated to deception, *FM 31-40*: *Tactical Cover and Deception;* however, this manual was classified 'confidential,' effectively placing it, and therefore detailed deception guidance, out of reach of much of the force. As a consequence of the manual's publication, the 1962 iteration of *FM 100-5* truncates the section on military deception to two paragraphs on the utility of deception that close with a reference to *FM 31-40*. At the same time, the cover aspects of counterintelligence and camouflage remain intact. Despite the removal of deception guidance to *FM 31-40*, this *FM 100-5* continues the trend of deception being an important part of operations: "Tactical cover and deception plans are an integral part of

[44] Headquarters, Department of the Army, *General Orders no. 20* (Alexandria, VA: Department of the Army, 1955), www.armypubs.army.mil/epubs/pdf/go5520.pdf.. The aggressor cadre was a permanent opposing force designed to provide realism to Army training exercises. The aggressor cadre was equipped with numerous deception aids, including sonic platoons—elements outfitted with loudspeaker equipped vehicles and weapon simulation devices for conducting audio deceptions. See *FM 30-101 (1959)* for more information on the aggressor cadre.

all operations planning."[45] Furthermore, this edition of the operations manual includes tactical deception units as a type of combat support element—possibly a reference to the sonic deception units assigned to the aggressor cadre.[46] The 1968 version of *FM 100-5*, *Operations of Army Forces in the Field* repeats the short section on deception and a reference to *FM 31-40*. However, missing from this edition of *FM 100-5* is any reference to dedicated deception units as combat support elements; instead, tactical cover and deception is listed as a task of engineering units.[47] At some point in the early 1960s proponency for deception was transferred from Command and General Staff College to the U.S. Army Combat Developments Command.[48]

FM 31-40 was updated with changes in 1960 and 1963, and a still classified update to *FM 31-40* was published in 1967. [49] In 1969, the U.S. Army published *Training Circular 30-1: Tactical Cover and Deception* (*TC 30-1*), an unclassified document providing guidance on the training of cover and deception from the company to division level, with the stated intent of encouraging commanders to include cover and deception in their planning process.[50] In 1973 an update was drafted but not published. Currently none of the editions of *FM 31-40* are available for examination, though an idea of their contents can be drawn from *TC 30-1*. The circular provides a basic overview of the history of deception; definitions of key terms and concepts; general guidelines, responsibilities, and considerations for planning of deception operations; and example

[45] Headquarters, Department of the Army, *Field Manual 100-5: Field Service Regulations—Operations, 1962* (Washington, DC: Department of the Army, 1962), 50.

[46] Headquarters, Department of the Army, *Field Manual 30-101: Aggressor, the Maneuver Enemy, 1959* (Washington, DC: Department of the Army, 1959), 55 – 57.

[47] Headquarters, Department of the Army, *Field Manual 100-5: 1962*, 39.

[48] This shift occurred prior to the still classified 1965 U.S. Army Combat Development Command report titled "Army Requirements for Tactical Deception."

[49] The official changes are noted on the entry for the 1967 edition of *FM 31-40* on the Combined Arms Research Library website. http://comarms.ipac.dynixasp.com/ipac20/ipac.jsp?menu=search&aspect=subtab316&npp=25&ipp=20&spp=20&profile=carlcgsc&ri=2&source=~!comarms&index=BIB&term=334188&x=0&y=0&aspect=subtab316

[50] Headquarters, Department of the Army, *Training Circular No. 30-1: Tactical Cover and Deception* (Washington, DC: Department of the Army, 1969), 3.

applications of deception. Of particular note is the planning consideration of target reaction, which demands a thorough understanding of the target:

> Success of cover and deception is dependent on the ability of the deceiver to predict the probable enemy reaction. The staff charged with the deception planning must be able to think as the enemy does and not react as a friendly commander transplanted into the enemy situation. This is possible only as a result of a thorough understanding of the enemy, his culture, and military system. The enemy intelligence system must be evaluated because this system is the vehicle that carries the deception story to the enemy commander. Determination must be made regarding the enemy's characteristics, his habits that make him vulnerable to deception, and those aspects that present the least likely deception target. The probable enemy reaction depends on the commander. An uncertain commander may react to deception while a steadfast veteran commander may ignore all but exceptionally convincing efforts. Some commanders may be overanxious, others overcautious; if possible, we should know the characteristics of the enemy commander, to include the degree of freedom allowed subordinates, his reaction time to new situations, and how this fear of the unknown influences his actions. A single known characteristic of a commander is more important than the entire statistical record of his military career.[51]

The one major drawback of *TC 30-1* is that since *FM 31-40* was classified, the information in *TC 30-1* with regards to means, techniques and examples of application is unfortunately shallow.

Looking at the camouflage aspect of deception, the 1959 edition of *FM 5-20* represented the pinnacle of the linkage between camouflage and cover and deception. In the manual's discussion of the nuclear battlefield, the manual explicitly states the role of camouflage in both denying information and deceiving:

> The best means of reducing the chance of a unit becoming the target of nuclear attack is to deny the enemy information as to the unit location and strength, or to fool the enemy by deception. Habitual use of proper camouflage will greatly assist in denying this information to the enemy.[52]

---

[51] Headquarters, Department of the Army, *Training Circular No. 30-1*, 15.

[52] Headquarters, Department of the Army, *Field Manual 5-20: Camouflage Basic Principles and Field Camouflage, 1959* (Washington, DC: Department of the Army, 1959), 3.

Additionally, *FM 5-20* emphatically bound camouflage to deception via the very definition of camouflage: "Camouflage is a French word meaning disguise and is used to describe actions taken to mislead the enemy by misrepresenting the true identity of an installation, an activity, or an item of equipment."[53] Finally, the manual reinforced camouflage's linkage to cover and deception to the point of subordinating camouflage to deception: "Camouflage, as an element of military deception, permits us to approach unseen and to remain hidden within striking distance of the enemy."[54]

Between the 1959 edition of *FM 5-20* and its successor in 1968, the relationship between camouflage and deception was severed. In the 1968 edition of *FM 5-20*, the third method of camouflage was changed from "deceiving" to "disguising."[55] Though deception was still discussed in the manual, to include a chapter on decoys, the concept of camouflage as an element of deception was thoroughly expunged. The divorce of camouflage from deception was reciprocated on the deception side of doctrine. The 1969 *TC 30-1* listed *FM 5-20* as a reference; however, the 1978 *FM 90-2: Tactical Deception* did not.

D. POST VIETNAM ERA THROUGH DESERT STORM

The 1976 edition of *FM 100-5* is an anomaly within the operations series as the manual is fixated squarely on the operations of a numerically smaller force against numerically superior Soviet forces in Western Europe. Though the distinct section on deception present in previous editions is absent, deception remains thoroughly integrated in the manual. For example, the following guidance is given for the offense: "If a smaller force is to concentrate superior combat power at the point of decision… commanders must employ surprise and deception as well as the full mobility of the force."[56] Furthermore, one of the basic tasks of the covering force in the defense is to deceive the

enemy, and deny information on friendly force dispositions.[57] In the section on desert warfare, the manual states, "using deception is a primary means of obtaining success."[58] However, despite the relatively complete integration of deception into operations, details on how to execute deception activities are again absent. Oddly, no mention is made of a deception manual within the body of the manual, though *FM 90-2* is listed in the references.[59]

The 1982 and 1986 editions of *FM 100-5* introduce the concept of Airland Battle, a fundamental revision of how the U.S. Army conducts operations. The Airland Battle approach places the principle of maneuver in primacy and embraces Liddell Hart's indirect approach.[60] As a result, deception is integrated into the 1982 and 1986 editions of *FM 100-5* to an unprecedented—and unrepeated—degree. Deception is included in the list of major functional areas alongside maneuver, intelligence, and fires.[61] In addition, deception is listed as a reason for offensive action, and discussed in depth in the sections on defense and retrograde operations.[62] Furthermore, echoing General Eisenhower's admonishment, the 1986 edition of *FM 100-5* states: "An integral part of any plan of campaign or major operation is the deception plan…. Deception is a vital part of tactical operations as well."[63] The dedicated section on deception, though smaller than the one in the 1954 edition, is still robust and includes examples of deception integration; as well as, some planning guidance.[64] The section on electronic warfare includes mention of manipulative electronic deception [MED] and imitative communications deception [ICD]

as electronic warfare activities that support the overall deception plan.[65] In a striking departure from previous operations manuals, the 1982 edition removes deception from the discussion of surprise as a principle of war, instead moving deception to the principle of security.[66]

In 1978, the U.S. Army retrieved the dedicated military deception manual from classified purgatory and published the unclassified *FM 90-2*: *Tactical Deception.* As the title implies, the focus of *FM 90-2* is with only the tactical fight: "…tactical deception here refers to short-term actions of corps or lower units within the battle area."[67] Though this "How to Fight" manual is rather simplistic, its release marked the beginning of a military deception renaissance within the U.S. Army. Of note however, the 1978 field manual severs the connection between deception and the term cover, though it maintains camouflage and concealment as aspects of visual deception. Despite these limitations, *FM 90-2* provides a workable foundation of deception practice, principles, and planning considerations.

In 1986 proponency for deception was transferred to the U.S. Army Intelligence Center and School at Fort Huachuca. Shortly afterwards, *FM 90-2* was updated as *FM 90-2: Battlefield Deception.* The 1988 iteration of *FM 90-2* is an intellectually weighty tome, delving into the cognitive underpinnings of deception as well as providing detailed guidance on the planning and execution of deception at both the tactical and operational levels of war. This manual was designed to address what the U.S. Army considered to be a shortfall in deception integration:

> Today, commanders use little deception in planning, directing, and conducting combat operations. As a result, many deception-related skills that have served our Army well in the past have been forgotten, and where remembered, have not been made part of our war-fighting capabilities Armywide.[68]

---

[65] Headquarters, Department of the Army, *Field Manual 100-5: 1982*, 7-19.

[66] Headquarters, Department of the Army, *Field Manual 100-5: 1982*, B-4.

[67] Headquarters, Department of the Army, *Field Manual 90-2: Battlefield Deception (HTF)* (Washington, DC: Department of the Army, 1978), 1-1.

[68] Headquarters, Department of the Army, *Field Manual 90-2: Battlefield Deception* (Washington, DC: Department of the Army, 1988), 1-0.

Without having access to the editions of *FM 31-40* for comparison, the 1988 edition of *FM 90-2* represents the strongest presentation of deception theory and practice within U.S. Army doctrine. Shortly after the publication of this edition, deception proponency was shifted once more, to the U.S. Combined Arms Center, where it remains.

E. POST COLD WAR ERA

Despite the successful use of deception in Operation DESERT STORM, the 1993 edition of *FM 100-5* almost appears to be a repudiation of the prior editions with regards to deception, and marks the beginning of deception's descent into a doctrinal abyss. Among the principles of war, deception is absent from security, and relegated to a mere factor of surprise; furthermore, economy of force demands force allocations for tasks such as deception be measures so as to not detract from the ability to mass at the decisive point.[69] Deception is not listed as a combat function; rather, deception is relegated to a single mention as one of the tasks contributing to mobility and survivability.[70] Finally, the robust section on deception in the 1986 edition is replaced by a two paragraph recitation of the definition of deception and guidance to see *FM 90-2* for further information. Though the term deception continues to appear throughout the manual, the overall marginalization of the concept of deception from the previous manuals is striking. A possible explanation for the marginalization of deception lies in the shift of the strategic equation with the fall of the Soviet Union. The collapse of the Soviet Union left the United States without a peer competitor, and thus without the need for indirect approaches to compensate for numerical inferiority and vulnerable lines of communication.[71]

The marginalization of deception continued outside the operations manual. In 1997, the U.S. Army's Combined Arms Center rescinded *FM 90-2* without replacement.

---

[69] Headquarters, Department of the Army, *Field Manual 100-5: Operations, 1993* (Washington, DC: Department of the Army, 1993), 2-5.

[70] Headquarters, Department of the Army, *Field Manual 100-5, 1993*, 2-14.

[71] See Chapter III for further discussion of the relationship between deception integration and perceived balance of power.

The stated reason was that the manual "no longer represents valid Army doctrine."[72] In 1998, an unofficial military deception planner's guide was published with a SECRET classification, again putting the tenets of deception outside the reach of a majority of the force. Additionally, since this was an unofficial document, it is given no reference in subsequent editions of *FM 100-5*. With the rescinding of *FM 90-2*, deception was subsumed by the emerging concept of information operations and incorporated into the 1996 *FM 100-6: Information Operations* as little more than a buzzword. Absent from *FM 100-6* is any guidance on the planning and execution of deception operations; as well as, any mention of the cognitive and theoretical foundations discussed in *FM 90-2*. *FM 3-13*: *Information Operations* replaced *FM 100-6* in 2003. Though *FM 3-13* provides more discussion on the integration, planning, and execution of deception than FM 100-6, the level is still far below *FM 90-2*. Furthermore, *FM 3-13* has fallen out of favor itself and is no longer in synch with *ADP 3-0*, limiting the manual's appeal.

In the 2001 iteration of the operations manual, now *FM 3-0, Operations*, deception continues its path into doctrinal oblivion. In keeping with the model of *FM 100-6*, deception is relegated to being an element of information operations, and an aspect of information superiority. While deception returns to the discussion of the principle of security, deception is absent from the principle of surprise.[73] The separate section on deception is limited to a single paragraph which restates the definition of military deception; gone is the guidance to refer to a deception field manual because the 1988 version of *FM 90-2* was phased out without replacement. As with the 1993 *FM 100-5*, the term deception is present, but the concept is not.

The 2008 edition of *FM 3-0* sees deception, now categorized as an information task, again limited to a single paragraph with a reference to *FM 3-13: Information Operations* and the joint forces publication on military deception, *JP 3-13.4: Military*

[72] Memorandum signed by Colonel Clinton J. Ancker III, Director, Corps and Division Doctrine, dated 30 September 1996 as cited in Bradley K. Nelson, "Battlefield Deception: Abandoned Imperative of the 21st Century" (Monograph, U.S. Army Command and General Staff College, 1997), 28, accessed 2 January 2012, http://handle.dtic.mil/100.2/ADA339425.

[73] Headquarters, Department of the Army, *Field Manual 3-0: Operations, 2001* (Washington, DC: Department of the Army, 2001), 4-14.

Deception. For the first time since 1914, the concepts of feints and demonstrations—in fact, the very words—do not appear within the operations manual. The early 2011 change to *FM 3-0* gives deception three paragraphs as an element of inform and influence activities, though there is a note stating: "military deception will migrate to another functional area in future editions of *FM 3-0*."[74] Interestingly, this edition does not reference the still current *FM 3-13* for deception guidance, rather it points to *JP 3-13.4*, the joint force publication. *ADP 3-0: Unified Land Operations* superseded *FM 3-0* as part of the Army's "Doctrine 2015" program. *APD 3-0*, weighing in at a concise 32 pages, does not mention deception at all, and relegates all inform and influence operations to three uses of the term without elaboration or mention of external references.

The 1990 edition of *FM 5-20*, renamed *FM 20-3: Camouflage*, further reduces the relationship of camouflage to deception by removing the chapter on decoys and stating that camouflage and deception are part of a set of interrelated tactical measures supporting survivability.[75] In 1998, *FM 20-3: Camouflage, Concealment and Decoys* introduces the term Camouflage, Concealment, and Decoys [CCD]. It is important to note the level of the disjunction between deception and cover at this point. While at the Army level the acronym CCD means the aforementioned Camouflage, Cover, and Decoys; at the joint level CCD means Camouflage, Concealment, and Deception [the Army refers to the joint version of CCD as JCCD]. Further, whereas the 1990 edition includes deception in the interrelated tasks supporting survivability, the 1998 edition removes deception. While essentially ignoring the connection between deception and camouflage, *FM 20-3* does ironically state in a standalone paragraph in its introduction:

> Deception helps mask the real intent of primary combat operations and aids in achieving surprise. Deception countermeasures can delay effective enemy reaction by disguising information about friendly intentions, capabilities, objectives, and locations of vulnerable units and facilities.[76]

---

[74] Headquarters, Department of the Army, *Field Manual 3-0: Operations, Change 1* (Washington, DC: Department of the Army, 2011), 6-19.

[75] Headquarters, Department of the Army, *Field Manual 20-3: Camouflage, 1993* (Washington, DC: Department of the Army, 1990), 1-1.

[76] Headquarters, Department of the Army, *Field Manual 20-3: Camouflage, Concealment, and Decoys, 1999* (Washington, DC: Department of the Army, 1999), 6.

The 2010 iteration of the Army's camouflage doctrine, *ATTP 3-34.39: Camouflage, Concealment, and Decoys* represents a complete reversal of earliest editions of camouflage field manuals, calling deception a component of CCD. However, the publication offers no discussion or guidance on deception.[77]

F. CONCLUSIONS OF DOCTRINE REVIEW

A review of the U.S. Army capstone document for operations from 1905 to present shows the emergence and growth of deception as an operational concept. However, the level of emphasis is cyclic, with peaks occurring during and immediately after World War II, and during the late 1970s through 1980s. Conversely deception integration is at its weakest prior to World War I, and since the end of the Cold War. Furthermore, the only time all the aspects of deception were unified under one concept was during the World War II era when the aspects were bundled under the aegis of counterintelligence. Since that time, deception was slowly and methodically dismembered and marginalized to the point that camouflage is no longer considered a form of deception and the term "cover" has completely lost its connection to deception within U.S. Army doctrine.[78]

[78] Headquarters, Department of the Army, *Field Manual 1-02: Operational Terms and Graphics* (Washington, DC: Department of the Army, 2004), 1-49; (Army) 1. Protection from the effects of fires. (FM 6-0) 2. A form of security operation whose primary task is to protect the main body by fighting to gain time while also observing and reporting information and preventing enemy ground observation of and direct fire against the main body. Unlike a screening or guard force, the covering force is a self-contained force capable of operating independently of the main body.

III. EXPLANATIONS FOR VARIATION OF DECEPTION EMPHASIS

As can be seen from the longitudinal survey of deception within U.S. Army doctrine, deception is consistently mentioned; however, the degree of emphasis and level of guidance varies significantly over time. The variance in deception emphasis has driven deception authors to propose numerous explanations as to why the U.S. Army does not treat deception with a greater level of emphasis given deception's demonstrated utility. The reason given the most weight is the idea that America's desired style of warfare, firmly grounded in cumulative destruction and influenced heavily by Clausewitz, leaves little consideration for indirect methods like deception.[79] The second reason, espoused by Herbert Goldhamer, is the rise of a professional officer class separated officers from the political practice of deception.[80] A third reason cited is the over-classification of deception post-WWII has had the unintended consequence of removing deception from consideration by the force. Fourth, various authors have pointed to the perception within Western culture that deception is immoral as reducing the desire to embrace deception's worth. While none of these explanations completely explain the diminished role of deception in U.S. Army doctrine, the American style of war best explains the fluctuations.

A. THE AMERICAN WAY OF WAR

The most frequent explanation of why the U.S. Army has not consistently placed the degree of emphasis on deception commensurate of deception's utility is that the style of war preferred by the United States does not emphasize indirect approaches, including deception. In order to assess this explanation it is necessary to first analyze the styles of war to see if there is a variation of deception emphasis between the styles, then examine

---

[79] Russell Weigley, *The American Way of War: A History of United States Military Strategy and Policy*, Indiana University Press paperback ed. (Bloomington IN: Indiana University Press, 1977), 584.

[80] Herbert Goldhamer, *Reality and Belief in Military Affairs: A First Draft (June 1977)* (Santa Monica, CA: The Rand Corporation, 1979), accessed 25 August 2011, http://www.rand.org/content/dam/rand/pubs/reports/2005/R2448.pdf.

whether the United States has a preference for one style of war, and finally, what reasons might drive any United States preference for a particular style.[81]

1. Styles of War

Essential to understanding the role, or lack of a role, of deception in the U.S. Army is an understanding the two warfighting styles employed by the U.S. Army. On one end of the spectrum is cumulative destruction, which includes what Hans Delbrück and Russell Weigley refer to as the strategy of annihilation, and what Basil Liddell Hart and Edward Luttwak call attrition. On the other end of the spectrum is systemic disruption, which includes Delbrück and Weigley's strategy of attrition; as well as, the indirect approach by Liddell Hart, and relational maneuver by Luttwak.[82] Cumulative destruction seeks to destroy the enemy's capacity for war by decisive defeat of the enemy's military forces, and exemplified by the battles of Cannae, Austerlitz, and the trenches of World War I, especially the German strategy at the Battle of Verdun. Because successful application of the cumulative destruction approach is rooted in the ability of a force to effectively inflict greater net damage on the enemy force, the approach is dependent on an overall force superiority. Even if an inferior force can achieve a series of tactical victories, the additive effect of the losses results in strategic defeat.[83] For example, General Lee's tactical victories over General Grant in the 1864 campaign came with unsustainable manpower losses for the Confederate force, resulting in the final strategic defeat and surrender at Appomattox.

Systemic disruption seeks to achieve victory through attacks against the enemy's weaknesses, (e.g., popular will, production capacity, communications, and command and

---

[81] Author's note: the discussion of styles of war within this thesis is solely in the context of emphasis on deception; any evaluation of the superiority of one style of war over the other is beyond the scope of this work.

[82] The terms cumulative destruction and systemic disruption are used because the various authors have used the term attrition with diametrically opposed meanings. Delbrück and Weigley equate attrition with the strategy of exhaustion; see Delbrück's *The History of the Art of War*. On the other hand, Luttwak, Erfurth, and Boyd use attrition with the meaning *Vernichtungsfeldzug* [annihilation through a series of battles]; see Luttwak's "Notes on Low-Intensity Warfare." In a similar vein, there is a risk of unintentional conflation of relational-maneuver with the maneuver principle of war.

[83] Edward Luttwak and Steven Canby, *MINDSET: National Styles in Warfare and the Operational Level of Planning, Conduct and Analysis* (Pontiac, MA: C&L Associates, 1980).

control) which leave the enemy paralyzed and unable to react effectively. The exemplars for systemic disruption are the German blitzkrieg, most forms of guerrilla warfare, and the AirLand Battle concept. Because the systemic disruption approach places strength against weakness, the potential effect is not dependent on overall force superiority. An inferior force has the potential for strategic victory over a superior force; therefore inferior forces must lean towards a systemic disruption approach in order to have a chance at prevailing.[84] Guerrilla campaigns and insurgencies by necessity spend most of their time tilted heavily toward systemic disruption, as a toe-to-toe fight with government forces from a position of inferiority invites defeat. For example, during the Tet Offensive, the Viet Cong attempted to shift to a cumulative destruction posture resulting in the destruction of the Viet Cong as an effective fighting force.

	Cumulative Destruction	**Systemic Disruption**
Target	Strength against Strength	Strength against Weakness
Endstate	Incapacitation through attrition of resources (e.g., manpower, equipment, supplies); *Materialschlacht* (battle of material)	Incapacitation through strategic paralysis
Focus of Efforts	Tactical level, with objectives in terms of terrain	Operational level, with objectives in terms of shattering the enemy
Outcome	Predictable, based on "overall superiority of net attrition capacity"[85]	Unpredictable, based on ability to perceive and affect enemy weaknesses
Orientation	Interior focus on processes to achieve maximum efficiency of tasks	External focus to identify enemy weaknesses and limitations
Force Design	Systems and formations designed for all-around capabilities – infrequent, revolutionary changes to capabilities	Systems and formations designed for specific enemy forces – frequent, evolutionary changes to capabilities

Table 1. Characteristics of Cumulative Destruction and Systemic Disruption

[84]Luttwak and Canby, *MINDSET: National Styles in Warfare*, 6.

[85] Luttwak and Canby, *MINDSET: National Styles in Warfare*, 3.

[86] Luttwak and Canby, *MINDSET: National Styles in Warfare*, 1 – 29; William Lind, "The Case for Maneuver Doctrine," in *The Defense Reform Debate*, eds. Asa Clark, Peter Chiarelli, Jeffrey McKitrick, and James Reed (Baltimore: The John Hopkins University Press, 1984), 88 – 100.

Cumulative destruction and systemic disruption as described above actually represent a false dichotomy for the sake of analysis. In practical application, pure expressions of either approach do not exist. Rather, all warfighting can be envisioned as existing on a spectrum between cumulative destruction and systemic disruption, exhibiting aspects of each style.[87] The degree to which a commander's style tips towards cumulative destruction or systemic disruption influences the degree to which deception is practiced. Luttwak suggests that forces leaning towards the cumulative destruction style tend to be more focused on internal processes and organization than on the enemy since victory is achieved by the most effective and efficient application of superior firepower. Because of this inward perspective, there is less effort given to understanding the enemy to the degree needed for effective deception. Conversely, systemic disruption oriented forces are more focused on the external since victory is achieved through the identification and exploitation of enemy weaknesses.[88] Deception is considered to be one of the three interrelated principles of systemic disruption, along with avoidance of the enemy's main strength and dominance of momentum.[89] As a result of the centrality of deception to systemic disruption, the deception plan is elevated "…to full equality with the battle plan; certainly deception planning cannot remain a mere afterthought."[90] Thus, as a force leans towards cumulative destruction, the emphasis of deception decreases, and conversely, as the force leans towards systemic disruption, the emphasis of deception increases.

Clausewitz's *On War* and Jomini's *The Art of War* are considered the pillars of the cumulative destruction mode of warfighting. Sun Tzu's *The Art of War* and Basil Liddell Hart's *Strategy* are representative of the systemic disruption model. Colonel John Boyd's "Patterns of Conflict" provides a thorough comparison between the two styles, though Boyd's preference for systemic disruption colors the discussion. Additionally,

Michael Handel's *Masters of War* offers side-by-side comparison and analysis of Clausewitz, Jomini, and Sun Tzu; as well as, Machiavelli and Mao Tse-tung.

2. American Preference for Cumulative Destruction

As Lysander suggested, when the skin of the lion—force—will not suffice, then the skin of the fox—guile—must be used to cover the gap. The inherent implication to this advice is when the skin of the lion is sufficient, the fox is not needed. Several authors mention the evolution of Napoleon's warfighting as the exemplar for this relationship. As Napoleon's armies grew in power and capability, Napoleon transitioned from a reliance on cunning and misdirection to a reliance on force.[91] Weigley, in his classic, *The American Way of War*, states as his premise that America fought a war of systemic disruption during the Revolutionary War because the nascent nation was too weak to fight a war of cumulative destruction; however, after the Revolution as the nation grew and strengthened, the strategy of cumulative destruction became the preferred America strategy.[92] Even during the Revolutionary War there was resistance to the systemic disruption approach employed by General Washington, as exemplified by John Adams in a letter to Abigal Adams: "I am sick of Fabian systems in all quarters. The officers drink, A [*sic*] long and moderate war. My toast is, A [*sic*] short and violent war."[93] John Adams' desires are frequently reflected in U.S. Army doctrine. For example, *FM 100-5* (1939) states:

> The *ultimate objective* [emphasis in original] of all military operations is the destruction of the enemy's armed forces in battle…. Concentration of *superior forces* [emphasis in original], both on the ground and in the air, at the decisive place and time, creates the conditions most essential to decisive victory and constitutes the best evidence of superior leadership.[94]

[94] War Department, *Tentative Field Service Regulations of Operations, 1939*, 27.

Additionally, *FM 100-5* (1993) states the American people's desire for short, decisive war:

> The American people expect decisive victory and abhor unnecessary casualties. They prefer quick resolution of conflicts and reserve the right to reconsider their support should any of these conditions not be met.[95]

These attitudes are the essence of cumulative destruction, and help demonstrate the U.S. Army's preference for that style of war.

Since the United States tends towards the cumulative destruction side of the spectrum, U.S. Army doctrine tends to embrace Clausewitz's positions on the execution of war. As a result, Clausewitz's disdain may have an impact on deception's place in doctrine. Clausewitz writing about craft and cunning stated: "The fact remains that those qualities do not figure prominently in the history of war. Rarely do they stand out amid the welter of events and circumstances."[96] As for the act of deception, Clausewitz argues:

> To prepare a sham action with sufficient thoroughness to impress an enemy requires a considerable expenditure of time and effort, and the costs increase with scale of the deception. Normally, they call for more than can be spared, and consequently so-called strategic feints rarely have the desired effect.[97]

Goldhamer suggests this blatant disregard for the historic record as the "bias of a professional soldier for whom the conflict of force with force and the destruction of the enemy on the battlefield were the principle instruments in the art of war."[98] Handel suggests that Clausewitz and Jomini's diminishing of deception and trickery in war was a result of the period in which they fought.[99] Handel further points out that Clausewitz's method of war relied on a concentration of forces at the decisive point, and that deceptive feints and demonstrations reduced a commander's ability to mass his forces.[100]

Regardless of the reasoning at the time behind Clausewitz's diminishment of the utility of deception, his work continues to influence the development of U.S. military doctrine.

3. Balance of Power

If one accepts that the U.S. Army tends to favor a cumulative destruction style, why has U.S. Army doctrine on occasion increased its emphasis on deception? The answer may lay in the comments of Weigley and others: perceived and actual balances of power influence the proportions of cumulative destruction and systemic disruption within a force's particular warfighting style. If there is a significant imbalance between opponents, the stronger force can rely on its strength to overcome the opposition. J. Bowyer Bell states:

> Power and capacity, as in real life, can make deception unnecessary. Napoleon, as the power of his armies increased, relied more on force and less on cunning and misdirection. In an invasion of a small country, the larger aggressor need only dispatch overwhelming power: how could Grenada repulse the forces of the United States…. American military strategy has often been based on deploying maximum power and technological capability without recourse to duplicity—"more" is more and force needs no enhancing…"[101]

Because a superior force does not need to rely as heavily on aspects of systemic disruption like deception, while conversely an inferior force must shift weight towards a systemic disruption approach, there is a trend whereby the level of emphasize on deception within U.S. Army doctrine waxes and wanes as the perceived and actual balance of power shifts (Figure 2).

[101] Bell, "Toward a Theory of Deception," 251; A similar opinion is stated in *Secret Soldiers*: "An army possessing overwhelming numbers of troops or material would not have to resort to wiles." Philip Gerard, *Secret Soldiers* (New York: Penguin Group, 2002), 5.

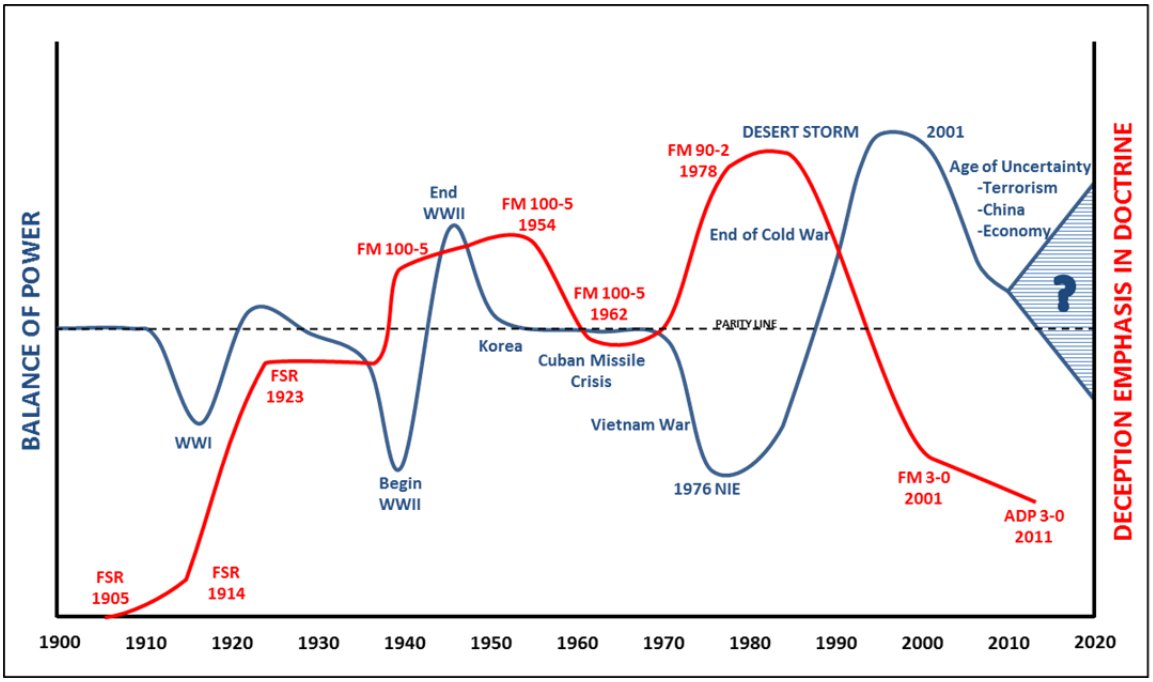

Figure 2. Comparison of Balance of Power and Doctrinal Emphasis of Deception

During World War I, the German military was seen initially as a superior competitor, thus during World War I deception—especially the covering aspects of camouflage and operations security—increased in importance. This increase is reflected by the inclusion of sections on counterinformation and surprise in the 1923 *Field Service Regulations*. Similarly, during World War II the Axis was seen as an existential threat, and deception reached a crescendo. Post-World War II, the United States operated from a position of parity during the Cold War, and over time deception receded from the operations manuals.[102]

The 1970s represented a tectonic shift in the perceived balance of power. First, the failures of Vietnam, the Mayaguez incident, and the failed attempt to rescue the hostages in Iran caused a crisis of faith within the U.S. Army leading to the development

[102] The emergence of the Special Forces and the rest of the special operations community can be viewed as the U.S. attempt to keep the conventional forces focused on cumulative destruction while still leveraging the value of systemic disruption.

of the Airland Battle doctrine.[103] Second, the 1976 National Intelligence Estimate on Soviet military capability included a second assessment which painted the Soviet military as superior to the United States military in both nuclear and conventional forces:

> *Within the ten year period of the National Estimate the Soviets may well expect to achieve a degree of military superiority which would permit a dramatically more aggressive pursuit of their hegemonial [sic] objectives*, [italics in original] including direct military challenges to Western vital interests, in the belief that such superior military force can pressure the West to acquiesce or, if not; can be used to win a military contest at any level.[104]

Additionally, the National Intelligence Estimate addendum reassessed Soviet intentions, painting a picture that the Soviet Union was a far greater and imminent threat than previously recognized. This radical re-estimation of Soviet capabilities and intentions shifted the perceived balance of power, placing the U.S. in an inferior position. As a result, U.S. Army doctrine at the time increased emphasis on systemic disruption and deception. The 1976 edition of *FM 100-5* fixates almost totally on operations in Western Europe against a superior force. This manual also marks the reemergence of deception emphasis to a degree not seen for decades. Furthermore, the era marks a renaissance of deception throughout the U.S. Army culminating with the central use of deception during Operation DESERT STORM. The 1982 and 1986 editions of *FM 100-5* see the U.S. Army doctrine at the apex of systemic disruption.

With the collapse of the Soviet Union in 1991, the United States was left without a peer competitor. As a result, the balance of power shifted decisively in the favor of the United States, alleviating the perceived need to emphasize systemic disruption. In the absence of an overpowering threat, U.S. military doctrine returned to the comforts of the cumulative destruction style of war, and deception emphasis ebbed to the point that the current capstone operations manual, *APD 3-0*, does not mention deception at all.

B. PROFESSIONAL OFFICER CLASS

Goldhamer suggests an interesting alternate hypothesis: the rise of the professional officer class led to the marginalization of deception in war. The professional officer class became specialists in the art of the direct approach as described by Clausewitz, and developed a professional pride in using physical force to overcome an adversary. The sense of worth as a professional officer was based in the ability to defeat the enemy in a stand up fight.[105] Gerald in *Secret Soldiers* provides anecdotal evidence supporting Goldhamer's assertion stating:

> Not all soldiers are fond of practicing deception. Some American combat commanders in World War II instinctively resisted using deception, preferring to charge straight ahead like the old-style cavalrymen they were…. Others… simply preferred conventional battle as a route to honor and glory.[106]

Additionally, the political agnosticism of the professional officer class also impacted deception, as it separated military action from foreign political involvements—foreign political involvements are seen by Goldhamer as more conducive to manipulation and deception.[107] The divorce of the senior officer class from diplomacy meant a degradation of peacetime concerns about national strategy; as well as:

> …those manipulative and deceptive measures that might strengthen in peacetime the nation's position vis-a-vis a potential enemy by misleading him and weakening his present and future powers of resistance. Such measures require close coordination of military and political leadership, a cooperation less likely to occur given the professional soldier's distance from the foreign office and for the most part, the political leader's and parliamentarian's divorce from strategic and grand strategic concerns."[108]

Goldhamer's argument is undermined somewhat by the championing of cover and deception by General Eisenhower during and after World War II; however, the idea of the U.S. Army as a profession of arms is a recurrent theme that may serve to reinforce direct approaches.

C. OVER-CLASSIFICATION

A third potential explanation for the dearth of deception in U.S. Army doctrine is the over-classification of deception. While security is essential for the execution of deception operations, classification of the very concept can be immensely detrimental to the inculcation of the utility of deception to the force. If future leaders are not exposed to deception during their formative years as junior officers, how can they be expected to appreciate deception's utility later? The negative impact of classification can be seen in a 1948 memorandum from the Office of the Chief of Army Field Forces to the commanders of the Armored, Artillery, and Infantry Centers on the subject of training cover and deception. The cursory introduction to strategic cover and deception was restricted to confidential level with no questions authorized and contained the comment: "The security classification of this whole subject [strategic cover and deception] is and probably will remain TOP SECRET [emphasis in original]…" leaving one to wonder the utility of the training.[109] Tactical cover and deception was subjected to similar classification. Classification of the first two editions of *FM 31-40: Tactical Cover and Deception* effectively removed deception from the playing field. The 1954 edition of *FM 100-5* contained several pages on the planning and execution of tactical cover and deception; however, this was cut to a couple of paragraphs in the 1962 edition.

In addition to the classification of doctrine, the classification of the actual deception operations negatively impacted the institutional memory of the force. The mission of 23rd Headquarters Special Troops, a purpose built deception unit in World War II, was not declassified until 1996.[110] With the information on operations compartmentalized behind walls of classification, the memory of deception resting in the minds of the practitioners could not be effectively passed on to future generations of leaders. Thus as the personnel with firsthand knowledge of deception operations retired from the force, the institutional knowledge retired with them.[111] The double impact of the

[111] Bell, "Toward a Theory of Deception," 251.

Page 747 of 3957

classification of both deception doctrine and historic examples of deception placed an extremely high barrier against access of deception resources by junior leaders, inhibiting the development of new institutional memories on the use of deception. The lack of exposure at the junior levels translating into a feeling at higher levels of command that deception is unnecessary—after all, it was not needed at the lower levels.

D. MORALITY

A fourth potential explanation touched on by Jon Latimer, John Bell, and Barton Whaley is that deception is immoral. Honesty has long been considered a virtue within American life as expressed by maxims such as "Honesty is the best policy," and the apocryphal tale of George Washington and the cherry tree. The idea of the American military as moral paragons is also frequently present in official and unofficial military guidance and writings. For example, General Dempsey [in his paper "America's Military- a Profession of Arms"] recently stated:

> The Profession of Arms demands its members live by the values described in the "City on the Hill" metaphor. We must provide an example to the world that cannot be diminished by hardships and challenges. This example is based upon the words and intent of the US Constitution that each of us takes a personal oath to support and defend. Our oath demands each of us display moral courage and always do what is right, regardless of the cost. We are all volunteers in our willingness to serve and to place others' needs above our own. As shared values, our calling cards are Duty, Honor, Courage, Integrity, and Selfless Service. Commitment to the rule of law is integral to our values which provide the moral and ethical fabric of our profession.[112]

Deception in particular has been viewed as dishonorable, an idea exemplified by the some of the responses over Colonel Funston's use of deception to achieve victory over the insurgents during the Philippine Insurrection; rather than lauded, Funston was vilified for winning by deceit.[113] On the floor of the Senate, Senator Patterson of

[113] J. Bowyer Bell and Barton Whaley, *Cheating and Deception* (New Brunswick, NJ Transaction Publishers, 1991), 45.

Colorado accused Funston of violating the rules of civilized warfare.[114] Colonel Funston was also the subject of a sermon decrying the use of underhand methods which lower the standard of honor.[115] However, while it may be that deception is viewed as immoral, little in U.S. Army doctrine conveys this view. The 1905 edition of *Field Service Regulations* stands almost alone in its level of condemnation of illegal acts of deception.[116] Furthermore, a survey of the use of deception by the U.S. Army across the span of its history shows that even if deception is viewed by the organization as immoral the view is not a serious impediment to the execution of deception. Rather, the attitude of Ulisse Guadagnini seems to hold more sway: "Moral considerations have validity only in civilian life and should not interfere with preparations for war."[117]

E. CONCLUSION

The primary explanation for the undervaluing of deception in U.S. Army doctrine is the emphasis on the cumulative destruction style of war; however, the other explanations play their part in further reducing the level of emphasis. Taken together, the composite effect of the explanations leads to the creation of an organizational bias against deception. Daniel and Herbig state that organizational bias presents itself in two ways. First, there is a "bureaucratic imperative that organizations trained for particular tasks will seek to perform them." Second, due to availability bias, people will think and act in ways familiar to them.[118] Allison and Zelikow in *Essence of Decision* present a model for organizational behavior that suggests the behavior is linked more to standard operating procedures and established doctrine than to deliberate choices. Formalized doctrine

serves to constrain behavior.[119] Thus the degree of emphasis on deception in doctrine translates to the degree of deception operations in practice.

Another area where the organizational bias has impacted deception is the lack of a stable proponency. Since 1923, deception has shifted proponency numerous times, and has never been in the position of being the primary focus of whatever command held purview. Additionally, some aspects of deception have been separated under difference proponents, such as camouflage under the U.S. Army Engineer School. The lack of a stable proponency with deception as its central focus further undermines the integration of deception into U.S. Army doctrine three important ways. First, the frequent changes of deception proponency impede continuity of knowledge. Second, since deception is never the primary focus for a proponent, deception is always at risk of marginalization in favor of the primary focus. Third, some efforts implemented are abandoned when the proponency changes. For example, while deception was under the U.S. Army Intelligence Center and School, the tables of organization for corps and divisions were modified to add deception cells. After deception proponency shifted to the U.S. Army Combined Arms Center, the deception cells were dropped in order to support the emerging requirement for unmanned aerial vehicles.[120]

IV. THEORY OF DECEPTION

> *Every means is permitted which deceives the enemy and induces him to take wrong steps. The lion's bravery and the fox's cleverness must combine to wrest victory from the enemy.*
>
> *– General Waldemar Erfurth*[121]

A. WHAT IS DECEPTION

Despite deception's long and storied place in the history of war, J. Bowyer Bell and Barton Whaley assert in, *Cheating and Deception*, that their theory was the first attempt to create a "general theory of cheating."[122] Bell and Whaley's theory of deception is elegant in its simplicity. The theory categorizes all deceptions into two interdependent sets: showing the false and hiding the real. These categories are further subdivided into six categories. Hiding the real is divided into the categories of masking, repackaging, and dazzling, while showing the fake is divided into the categories of mimicking, inventing, and decoying. Each category has myriad characteristics that can be drawn from for the deception plan. The categories of deception and the chosen characteristics are used in ruses to create one of five effects: unnoticed, benign, desirable, unappealing, and dangerous. The purpose of the ruse is to create a perception in the target that causes the target to generate an illusion the target interprets as reality, causing the target to act in the desired manner to achieve the deception goal and thus the strategic goal.[123] While Bell and Whaley's theory provides a neat and tidy structure for the taxonomy of deception, one weakness of the theory is that it does not delve in the cognitive psychology allowing deception to occur.

Michael Dewar offers a different theory of deception in *The Art of Deception in Warfare*. Dewar's theory is a less structured discussion than Bell and Whaley's theory; nevertheless, the theory provides important insights into the inner workings of deception. Dewar provides an overview of deception means, principles, and techniques. Of

Page 751 of 3957

particular note are his comments on the prevalence of preconceived ideas on the battlefield, and the role of doctrinal and technical innovation in achieving surprise.[124]

1. Deception Defined

According to *Random House Webster's*, deception is "something that deceives or is intended to deceive; fraud; artifice."[125] While this is a sufficient definition for casual uses, this definition is not sufficient for deception in the context of military operations. Daniel and Herbig in their work "Propositions on Military Deception" define deception as: "the deliberate misrepresentation of reality done to gain a competitive advantage."[126] One problem with Daniel and Herbig's conceptualization of deception is their fixation on deception as being based in falsehood or lies. This concept of deception ignores the ideas of deception by omission and deception by selective truth. Furthermore, the definition makes no mention of the target of the deception. In the definition's defense, the concept of gaining a competitive advantage is important. Deception in military operations is not undertaken for deception's sake; deception is undertaken to achieve some goal.

The definition of deception used in U.S. Army doctrine since at least 1969 is a better starting point for a working definition of deception: "Activity designed to mislead an enemy by manipulation, distortion, or falsification of evidence to induce him to react in a manner prejudicial to his interest." [127] While the current U.S. Army definition is a good starting point, this definition too is not quite sufficient. The first deficiency with the current doctrinal definition is that "induce" is an imprecise term for what deception does: manipulating the enemy's decision-making process. Second, the best deceptions rely on a foundation of truth to reinforce and support the falsehoods, an idea the definition seems

---

[126] Daniel and Herbig, *Propositions on Military Deception*, 3.

[127] Headquarters, Department of the Army, *Training Circular no. 30-1: Tactical Cover and Deception*, 5; An almost identical definition is given in the 1957 *Special National Security Estimate: Soviet Capabilities for Deception* by the Central Intelligence Agency: Director of Central Intelligence, *Soviet Capabilities for Deception* (Washington, DC: Central Intelligence Agency, 1957), accessed 30 January 2012. http://gateway.proquest.com/openurl?url_ver=Z39.88-2004&res_dat=xri:dnsa&rft_dat=xri:dnsa:article:CSE00201

to ignore with the modifiers used to describe the evidence. Finally, the term enemy is unnecessarily constraining, as deception can be applied against any target. A strength of the doctrinal definition is its acknowledgement of the role of intent in human deception. While biological deceptions exhibited in the plant and animal kingdoms can be unintentional, human deception requires intent.[128]

Taking in account the shortcomings of the existing definitions of deception, a modified definition of deception can be crafted:

> Deception is the deliberate misleading of a target into taking actions prejudicial to the target's interests by manipulating the target's decision-making processes through the communication of true, manipulated, distorted, and/or falsified information.

This revised definition of deception requires some elaboration. Deliberate misleading does not obligate the practitioner to a formal planning process; while formal planning is preferable, rapid ad-hoc planning by a nimble practitioner can in extremis achieve the objective in time constrained or fluid situations, though with increased risk of failure. Successful deception is more than creating a perception; successful deception is about the target taking action. Furthermore, the goal of a deception can be the target taking no action at all, e.g., the failure of a regime's security apparatus to breach a special reconnaissance element's cover or the German armored divisions remaining in place at Pas de Calais during the opening phases of Operation OVERLORD. The interaction between the practitioner and the target occurs in the framework of communication. Finally, the perceptions used by the target in its decision-making process rely heavily on the indicators created by the practitioner.

2. Deception: Truth and Lies

Many definitions of deception conflate deception with lies; however, this conflation is incorrect as deceptions and lies are not synonymous. In order to discuss the difference between a lie and deception it is first necessary to establish an adequate

[128] For a discussion on biological deceptions see: Scott Gerwehr and Russell W. Glenn, *Unweaving the Web: Deception and Adaptation in Future Urban Operations* (Santa Monica, CA: Rand, 2002), 78. For a discussion on the requirement for intent in human deception see: Roderick M. Chisholm and Thomas D. Feehan, "The Intent to Deceive," *The Journal of Philosophy* 74, no. 3 (March, 1977), 143 – 159.

definition of each. One definition defines a lie as occurring when a person asserts to a second person a proposition that the first person knows to either be false or not true with the intent of causing the second person to have a justified belief in the proposition.[129] Since a deception can contain truth—an actual training exercise used as part of a deception is still a true event—it is immediately apparent that deception and lies are not equal; however, this still leaves the proposition that lies are a subset of deception.[130] For example, Daniel and Herbig's model of deception has lies and the act of lying subsumed by deception (Figure 3). The definition of deception used here requires injury to the target or advantage for the practitioner; this leaves lies undertaken without the intent of injury or advantage [white lies] to exist outside the sphere of deception. Thus, while the sets of lies and deception overlap, neither subsumes the other (Figure 4). While lies are used in deception, not all deceptions are lies. Judicious use of the truth can be far more supportive of deception than outright falsehood.

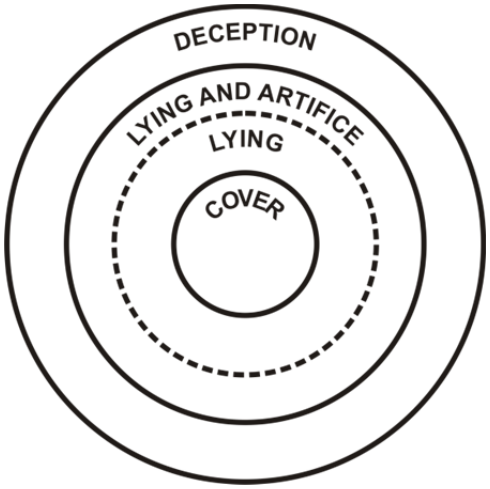

Figure 3. Daniel and Herbig's "Deception's Subsidiary Concepts." (From: [131])

[129] Chisholm and Feehan, *The Intent to Deceive*, 152; This work presents an in-depth parsing of what it means to lie and what it means to intend to deceive.

[130] Chisholm and Feehan provide another illuminating example attributed to Immanuel Kant: "For there are types of intended deception that cannot properly be said to be cases of lying. Kant's example will do: 'I may, for instance, wish people to think that I am off on a journey, and so I pack my luggage; people draw the conclusion I want them to draw . . .' But although I thus succeed in deceiving them, Kant insists, 'I have not lied to them, for I have not stated that I am expressing my opinion.'" Chisholm and Feehan, *The Intent to Deceive*, 149.

[131] Daniel and Herbig, *Propositions on Military Deception*, 4.

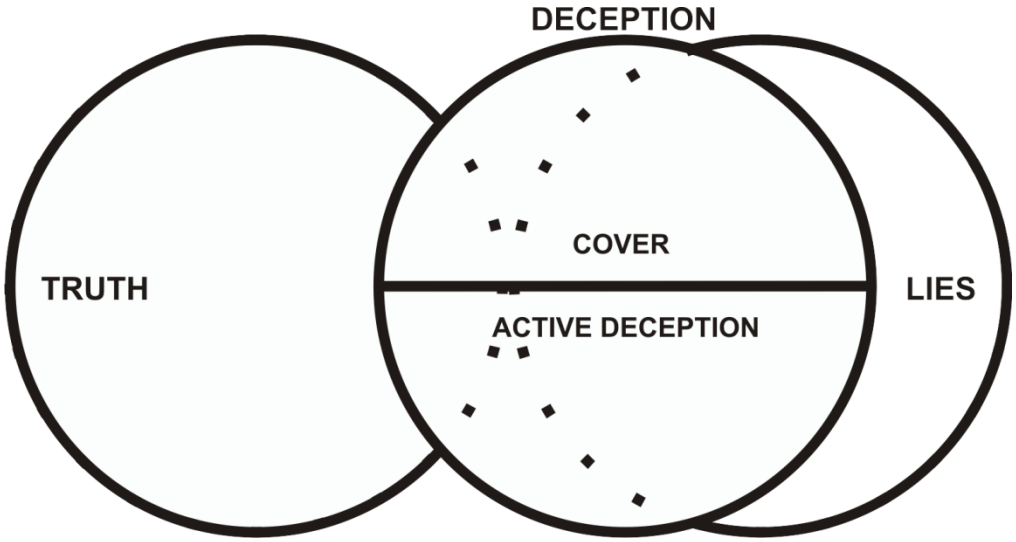

Figure 4. Interrelationship of Truth, Deception, and Lies

B. TAXONOMY OF DECEPTION

1. Taxonomy of Method

Taxonomies are systems of categorizing items in a set into subordinate sets based on a defined system of characteristics. The most recognizable example for taxonomies is the system of classifying living things into kingdoms, phyla, classes, orders, families, genera, and species. Within the field of deception, there are several suggested taxonomies for deception, four of which are: method, sophistication, effect, and commission-omission. Taxonomy by method focuses the mode of the deception, such as a display. Taxonomy by sophistication categorizes deceptions by the degree to which the deception adapts or does not adapt to changing circumstances. Taxonomy by effect focuses on what the deception does, e.g., dazzling. Finally, taxonomy by commission-omission breaks down deceptions based on whether the deception causes the target to acquire a false belief or contributes to the target continuing a false belief. For this purposes of this work, taxonomy by method is used as it closely matches existing U.S. Army doctrinal concepts of deception (Figure 5). Brief descriptions of the alternate taxonomies are provided at the end of this section.

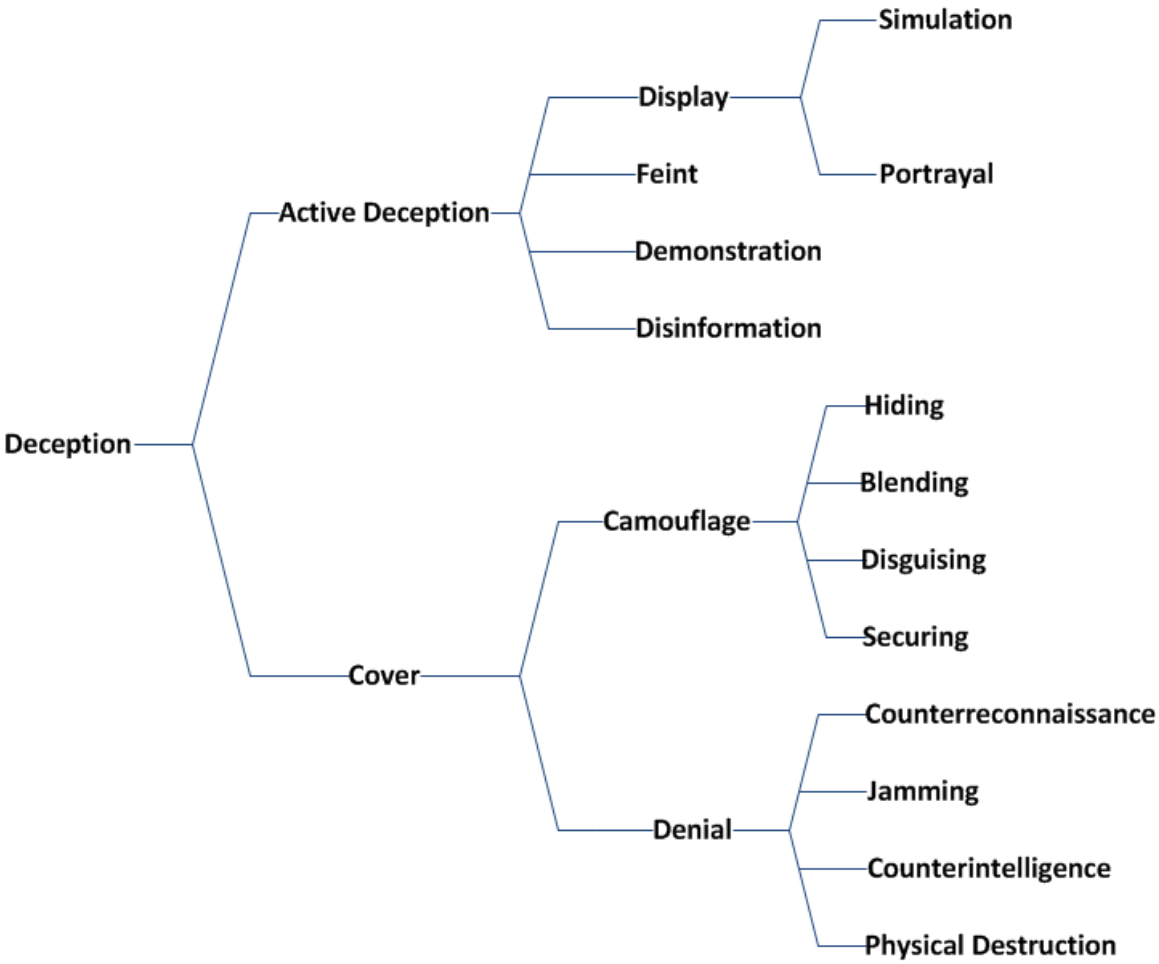

Figure 5. Taxonomy of Deception

2. Deception

Deception is the set of actions designed to deliberate mislead a target into actions or inactions prejudicial to the target's interests by manipulating the target's decision-making processes through the communication of true, manipulated, distorted, or falsified information. Deception is subdivided into two broad categories: active deception and cover. Active deception consists of those actions designed to convey deceptive indicators to the target. Cover, as used here, is the set of actions designed to prevent the target access to the indicators necessary for constructing a correct perception of the situation

and environment, and thus necessary for proper decision-making.[132] Though some of the actions included in the category of cover are not usually considered to be part of deception in U.S. Army doctrine, the obfuscation of indicators is an intrinsic part of deceiving a target.[133]

3. Active Deception

Active deception is comprised of actions which convey deceptive information to the target, also referred to as simulation or showing the false. The set of active deception includes those modified versions of the actions traditionally associated with military deception. Active deception is divided into four broad categories: displays, feints, demonstrations, and disinformation.

a. Displays

Displays are static depictions of activities, forces, or equipment for the purpose of deceiving the target's collection apparatus.[134] Though the formal Army definition of a display limits the type of target collection to visual, displays can also occur in all physical senses; as well, as in the electromagnetic spectrum. Displays are divided into two categories: simulation and portrayal. Simulations use decoys and other devices

---

[132] This usage of cover is consistent with historic Army and DOD usage, and in numerous civilian works. See: Headquarters, Department of the Army, *Field Manual 1-02*, 1-48 to 1-49; Concepts and Force Design Group, *Tactical Cover and Deception: Final Report*, 1-4; Daniel and Herbig, *Propositions on Military Deception*, 4; Robert Goldsmith and Ralph Gerenz, *Techniques for Detecting Cover and Deception*, (Billerica, MA: Betac Corporation, 1983), accessed 16 May 2012, http://handle.dtic.mil/100.2/ADP002896, 145.

Cynthia Grabo provides an alternative definition for cover which is more constrained: "Cover (here meaning the "cover plan'' or "cover story'') is a form of military deception which should be distinguished from active military deception, although it may often be used in conjunction with it. Cover will be used when it may be presumed that the military buildup itself cannot be concealed from the adversary, and its purpose therefore is to offer some seemingly plausible explanation (other than planned aggression) for the observable military activity." Cynthia Grabo, *Anticipating Surprise: Analysis for Strategic Warning*, ed. Jan Goldman (Washington, DC: Center for Strategic Intelligence Research, Joint Military Intelligence College, 2002), accessed 14 May 2012, www.ni-u.edu/ni_press/pdf/Anticipating_Surprise_Analysis.pdf, 125.

[134] Adapted from official Army definition: "In military deception, a static portrayal of an activity, force, or equipment intended to deceive the adversary's visual observation." Headquarters, Department of the Army, *Field Manual 1-02*, 1-83.

Page 757 of 3957

to create a dummy force or capability. Decoys are models or dummies used to replicate actual equipment, buildings, and personnel.[135] Magruder's Quaker guns were decoys used to create the perception that the Confederate lines were more heavily fortified than they were in reality. MACVSOG's ruse of an active resistance movement in North Vietnam contained major elements of simulation and portrayal.[136]

Portrayals use actual forces to present either the image of a unit which either does not exist, or that the unit is of a different type than it actually is.[137] An infantry company presenting itself as an infantry battalion or brigade is a form of portrayal. Pseudo-operations and "false flag" operations are specialized forms of portrayals where the unit being portrayed is either a third party or an element of the target's forces. Colonel Funston's ruse during the Philippines Insurrection involved his force portraying the insurgent force in order to gain access to the insurgent camp.[138] British forces in Kenya used pseudo-operations to masquerade as Mau-Mau elements for the purposes of intelligence collection.[139] Soviet forces engaged in "false flag" operations during the suppression of resistance movements in Lithuania by posing as the Lithuanian resistance while attacking the population in an effort to separate the resistance from the population.[140] Portrayals also encompass the cyberwar concepts of the honeypot and social engineering.[141]

[140] John Prados, *Presidents' Secret Wars*, revised and updated ed. (Chicago: Elephant Paperbacks, 1996), 38.

[141] A honeypot is an enticing computer or server designed to draw attacks by adversarial forces. Honeypots may also be classified as a form of feint here since they must survive contact with the target without revealing their true nature. The purpose of the honeypot is typically to gain intelligence about the adversarial forces' capabilities, identities, and location.

b. Feints

Feints are operations designed to deceive the target into reacting as if the feint is an actual decisive operation.[142] Feints differ from demonstrations in that some manner of contact with the target is sought. The degree of contact varies significantly. Feints are used for several purposes; for example, to distract the target from the actual decisive action, facilitating relative superiority at the point of decision; luring the target into exposing artillery positions; or to trick the target into prematurely committing the reserve. *Field Service Regulations* (1914) describes a stronger variant of the feint: holding attack. In addition to distracting the enemy from the main effort, the holding attack seeks to fix the enemy in time and space.[143] Also, the covering force concept in *FM 100-5* (1976) has an element of feint, though its primary mission is not deception.[144] In addition to traditional offensive and defensive operations, feints also encompass lures designed to draw the target into an unequal fight, e.g., the bait and ambush tactics of guerrilla and insurgent forces.

c. Demonstrations

Demonstrations are deceptive shows of force where actual engagement with the target is not sought.[145] Because contact is not sought with the target, the forces used for a demonstration can be considerably smaller than those used for a feint. While the traditional U.S. Army doctrinal definition of demonstrations implies demonstrations occur in the vicinity of the enemy lines, almost as a less aggressive form of a feint, this is

---

[142] Adapted from the DOD and Army definitions of feint: "In military deception, an offensive action involving contact with the adversary conducted for the purpose of deceiving the adversary as to the location and/or time of the actual main offensive action. (Army) A form of attack used to deceive the enemy as to the location or time of the actual decisive operation. Forces conducting a feint seek direct fire contact with the enemy but avoid decisive engagement." Headquarters, Department of the Army, *Field Manual 1-02: Operational Terms and Graphics*, 1-76.

[143] War Department, *Field Service Regulations*, 1914, 84 – 85.

[144] Headquarters, Department of the Army, *Field Manual 100-5*, 1976, p5-10 to 5-13.

[145] Adapted from the DOD, NATO, and Army definitions of demonstration: "An attack or show of force on a front where a decision is not sought, made with the aim of deceiving the enemy. 2. (DOD only) In military deception, a show of force in an area where a decision is not sought; made to deceive an adversary. It is similar to a feint but no actual contact with the adversary is intended. (Army) 1. A form of attack designed to deceive the enemy as to the location or time of the decisive operation by a display of force. Forces conducting a demonstration do not seek contact with the enemy." Headquarters, Department of the Army, *Field Manual 1-02: Operational Terms and Graphics*, p1-57 to 1-58.

not the case. Demonstrations include training events and exercises well away from the target. For example, a demonstration of increased airborne training in the United States can be used to create the perception of a pending airborne assault.

d. Disinformation[146]

Disinformation is the exposure to target collection assets of false, modified, or selectively true information with the intent to deceive.[147] Disinformation has no set form or design; any communication from a presidential proclamation to a scrap of paper left in a waste basket can be used to convey disinformation. The British DOUBLE CROSS system during World War II is considered the exemplar for disinformation, with British intelligence using its control of the German HUMINT networks in Britain and North Africa to great advantage.[148] Disinformation also includes the flooding of the information environment with notional information for the purposes of overloading the target's systems.[149] Deceptions of this type are similar to the jamming denial type, but different in that disinformation flooding contains deceptive indicators intended to mislead the target; whereas, the jamming of a radio net with static does not. Using multiple radio networks to obscure the actual location of a unit is an example of this form of disinformation, as is swamping a regime's police hotline with false reports in order to overwhelm the response system.

---

[146] Disinformation is used here because most deception literature uses the term "ruse" to mean any manner of deception. Disinformation differs from misinformation in that disinformation requires intent to deceive; whereas, misinformation does not require intent to deceive, though the intent may be present.

[147] Adapted from the DOD definition; Headquarters, Department of the Army, *Field Manual 1-02*, 1-82. Also see Barton Whaley, *Stratagem: Deception and Surprise in War* (Cambridge, MA, Center for International Studies Massachusetts Institute of Technology, 1969), accessed 16 February 2012, http://www.vietnam.ttu.edu/virtualarchive/items.php?item=2171516001, 17.

[148] See David Mure's *Master of Deception* and Ben MacIntyre's *Agent Zigzag* for further information on the British DOUBLE CROSS system.

[149] Barton Whaley, *Stratagem: Deception and Surprise in War* (Norwood, MA: Artech House, 2007), 9.

4. Cover

Cover is the set of actions taken to protect the actual mission by preventing the deception target from receiving the indicators of real actions, capabilities, or intentions.[150] Whereas active deception seeks to provide misleading information to the deception target, cover seeks to obfuscate by masking indicators and closing channels. There are two categories of cover: camouflage and denial.

a. Camouflage

Camouflage seeks to prevent indicators from being detected by the target's collection assets. Within camouflage, there are four broad methods: hiding, blending, disguising, and securing. In hiding the item is concealed by a physical barrier; such as, a bunker, cave, forest canopy, or netting. The physical barrier itself may be visible, blended into the background, or disguised. In blending, the item is concealed by means that merge the item with the background. This can be accomplished in the field through the application of camouflage paint or natural materials. In disguising, the item is concealed by making it look like something innocuous, such as a bunker disguised as a farmhouse.[151] In securing, indicators are reduced via the use of operations security, information security, and emissions control. While not traditionally considered aspects of camouflage, securing functions serve the same purpose—suppression of friendly indicators. The concepts of camouflage are applicable across the spectrum of operations. A special operations team operating out of a safe house is hidden within the safe house, which in turn is blended into the surrounding neighborhood. A HUMINT team attached to a maneuver element is blended in with the element. An intelligence officer conducting special reconnaissance while posing as a tourist is disguised. Through proper document disposal procedures, information is secured.

---

[150] Headquarters, Department of the Army, *Training Circular No. 30-1*, 5; see Note 130 for more information on this definition of cover versus the competing definition.

[151] Headquarters, Department of the Army, *Field Manual 5-20, 1968*, 17 – 20.

b. Denial

Whereas camouflage focuses on masking indicators, denial attacks the channels indictors travel on to the target. Denial seeks to degrade target collection channels so that the adversary is either not able to receive indicators, or is herded onto a smaller set of channels. Forcing the target to depend on a smaller set of channels reduces the ability of the target to validate intelligence using multiple sources, reducing the effort necessary in telling the deception story. Additionally, if the target can be herded onto channels controlled by friendly forces, deception indicators can be fed directly into the target's intelligence cycle, as was the case with the British DOUBLE CROSS operation in WWII. Denial methods include counterreconnaissance, jamming, counterintelligence, and physical destruction of collection tools. While these methods are not normally considered aspects of deception by U.S. Army doctrine, they are forms of cover to be considered during any deception planning and execution.

5. Alternate Deception Taxonomies

In addition to the method-based taxonomy of deception, there are other taxonomies for deception. Three alternate taxonomies are: commission and omission; level of sophistication; and effect-based. These taxonomies are useful for expanding the ways to think of deception.

a. Commission and Omission

Chisholm and Feehan in "Intent to Deceive" delineate eight types of deception divided into two categories. Deceptions by commission are typified by the deceiver contributing causally to the belief of the target. Deceptions by omission are typified by the deceiver facilitating the target's maintenance of an existing belief.

Page 762 of 3957

Deception by Commission 1- Deceiver contributes causally to target acquiring belief in the proposition 2- Deceiver contributes causally to target continuing to believe in the proposition 3- Deceiver contributes causally to target stopping belief in the negation of the proposition 4- Deceiver contributes causally to target not acquiring belief in the negation of the proposition
Deception by Omission 5- Deceiver allows target to acquire belief in the proposition 6- Deceiver allows target to continue belief in the proposition 7- Deceiver allows target to cease belief in the negation of the proposition 8- Deceiver allows target to continue without the belief in the negation of the proposition

Table 2. Chisholm and Feehan's Eight Ways to Deceive.[152]

b. Level of Sophistication

Gerwehr and Glenn in *Unweaving the Web: Deception and Adaptation in Future Urban Operations* present a way to categorize deceptions based on the level of sophistication used in the deception. Sophistication is determined by the degree to which the deception takes in count the variables of a situation, e.g., environmental factors, target capabilities, target preconceptions, and the context of the situation. There are four levels of sophistication, ranging from least to most sophisticated: static, dynamic, adaptive, and preemptive. Static deceptions are the least sophisticated of deceptions and "…are in place regardless of state, activity, or the histories of either the deceiver or target."[153] The Army Combat Uniform is an example of static camouflage. "Dynamic deceptions are those that activate under specific circumstances. The ruse itself and the trigger do not change over time, nor do they vary much by circumstance or adversary."[154] A howitzer battery having established procedures to erect camouflage netting upon occupying a firing position is an example of a dynamic deception. "Adaptive deceptions are triggered like dynamic deceptions, but either the trigger or the ruse itself can be modified with experience. This category covers deception improved through trial and error."[155] Wearing cloths of local design in order to blend into crowd during a special reconnaissance mission is an

[152] Chisholm and Feehan, *The Intent to Deceive*, 143 – 159.

[153] Gerwehr and Glenn, *Unweaving the Web*, 33.

[154] Gerwehr and Glenn, *Unweaving the Web*, 33.

[155] Gerwehr and Glenn, *Unweaving the Web*, 34.

example of adaptive camouflage. Premeditative deceptions display the greatest level of sophistication. "Premeditative deceptions are designed and implemented based on experience, knowledge of friendly capabilities and vulnerabilities, and, moreover, observations about the target's sensors and search strategies."[156] Complex deceptions, such as Operation FORTITUDE, are at the premeditative level of sophistication.

c. Effect-Based

Bell and Whaley in *Cheating and Deception* present an effect-based taxonomy of deception that categorizes deception by what the deception does. This taxonomy has two broad subdivisions: hiding and showing. Hiding deceptions seek to obscure indicators, and consist of masking, repackaging, and dazzling. Masking deceptions hide by blending the object into the background, as in camouflage. Repackaging deceptions hide the real by making the object appear as something innocuous, e.g., a bunker made to look like a food stand. Finally, dazzling seeks to confound the target about certain aspects of an object, such as using multiple radio transmitters to confuse the target of a unit's true location. Showing deceptions seek to present misleading indicators to the target and consist of mimicking, inventing, and decoying. Mimicking deceptions recreate the characteristics of an object for advantage, such as using a company of soldiers to replicate a division. Inventing deceptions mislead via creation of new objects, as in notional documents. Decoying misleads by presenting alternate options as the actual option, such as the First U.S. Army Group being used to mislead German leadership as to the actual target of Operation OVERLOAD.[157]

C. DECEPTION AND UNCERTAINTY

1. Uncertainty

Uncertainty is an unavoidable aspect of military operations. Despite the desires of every commander, a perfect understanding of the situation is impossible.[158] Among the

[156] Gerwehr and Glenn, *Unweaving the Web*, 35.

[157] Bell and Whaley, *Cheating and Deception*, 49 – 61.

[158] Indeed, the belief that a perfect understanding is even possible sets the stage for deception, whether self-inflicted or enemy induced.

Page 764 of 3957

phenomena creating uncertainty are inadequacy of collection channels, infiltration of noise corruption, and the fundamental inability to read the opponent's mind. The compounded result of these phenomena is an obscuration of the situation, as if a metaphorical fog had settled over the field. As Whaley states:

> It ["the fog of war"] refers to the chaos of information inherent in the fast-breaking crisis of battle--the confusing muddle of delayed and mislaid messages, garbled and misunderstood orders, fragmentary and misinformed intelligence, pridefully exaggerated claims of successes and cringingly suppressed reports of blunders. In other words, "the fog of war" is the state of uncertainty resulting from the inability of a military information system to either accurately or speedily monitor the events of battle. The battle maps and situation reports become jangled representations of fiction and fact. The Commander neither knows what he knows nor can be certain of what he doesn't know. Crucial decisions about deployment, tactics, and strategy are made with the most fragmentary information.[159]

Deception and uncertainty enjoy a complex relationship. The fog of war created by uncertainty provides the necessary environment for deception. If the enemy possessed perfect situational awareness deception would be almost impossible. Deception in turn can be used to either thicken the fog of war—increasing the target's uncertainty—or deception can be used to present a false parting of the fog—decreasing the target's uncertainty—by revealing vista of the deceiver's making. Deception used to increase uncertainty is often referred to as ambiguity increasing, or A-Type, deception. Deception used to create a false reduction of uncertainty is often referred to as misleading, or M-Type, deception.[160]

2. A-Type Deception

A-type deceptions seek to increase the ambiguity of a situation so that the target becomes "…unsure as to what to believe."[161] Ambiguity can be increased through the use of covering deception to obscure the real situation, through the use of active

[159] Whaley, *Stratagem* (1969), 257 – 258.

[160] Daniel and Herbig, *Propositions on Military Deception*, 5-7; Additionally, *FM 90-2, 1988* calls M-type "misdirection." Headquarters, Department of the Army, *Field Manual 90-2, 1988*, 1-9.

[161] Daniel and Herbig, *Propositions on Military Deception*, 5.

deception to present a number of reasonable alternatives to the real, or a mixture of both aspects. A-type deceptions can be attempted solely through the use of covering aspects, such as a unit camouflaging itself in a wood line. One of the goals of A-type deceptions is to cause the target to delay decision-making in the hopes of further information, thereby allowing the deceiver to seize or retain initiative. Another goal is to cause the target to spread their forces in an effort to cover every potential outcome, thus affording the deceiver the opportunity to achieve relative superiority at the point of decision.[162]

3. M-Type Deception

M-type deceptions "…reduce ambiguity by building up the attractiveness of one wrong alternative."[163] All M-type deceptions utilize covering deception to obscure the true situation, while using active deception to present the false situation. One goal of M-type deceptions is for the target to concentrate resources against the deception, allowing the deceiver opportunity to successfully conduct the true plan.[164] For example, the ambush of the Japanese fleet at Midway was facilitated by deceptive radio traffic which created the perception that Admiral Halsey's fleet was still in the vicinity of the Solomon Islands.[165]

D. THE WHY OF DECEPTION

1. Overview

As discussed previously, deception is not undertaken for the sake of deception; deception is conducted to drive the behavior of the target to achieve some benefit for the practitioner or some deleterious effect for the target. Four reasons are typically given for the use of deception: to achieve surprise, to gain freedom of action, to save lives, and to

---

mislead the enemy.[166] In addition to these reasons, there are four other reasons for attempting deception: to secure relative superiority at the point of decision, security, subversion, and mental isolation.

2. Surprise

Surprise is the most common reason cited for the use of deception. Surprise in the military context is defined as: "[striking] the enemy at a time or place or in a manner for which he is unprepared."[167] There can be no question of the role of surprise in war; of 122 battles surveyed in Whaley's classic study, the casualty ratio in battles without surprise was one-to-one; however, the casualty ratio where surprise was achieved was one-to-five in favor of the initiator.[168] Deception is the handmaiden of surprise as the secrecy necessary for surprise to succeed "…cannot be obtained by 'saying nothing.' Secrecy requires the systematic confusion and deception of the enemy."[169]

3. Freedom of Action

Deception can enhance freedom of action by decreasing the chance of enemy interference. Disguising movements of personnel, materials, and equipment as something innocuous can facilitate staging for future operations. Deceptions designed to prevent the target from interdicting lines of communication support freedom of action. Deception can also be used to assist the movement of key leaders. For example, President Roosevelt's secret meeting with Prime Minister Churchill to hammer out the Atlantic Charter in the fall of 1941 was facilitated by a portrayal depicting the president as being on a fishing trip off Cape Cod.[170]

Page 767 of 3957

4. Save Lives and Resources

Deception can be used to save lives and resources in three ways. First, through the achievement of surprise, gaining of freedom of action, and securing of relative superiority, deception can reduce the amount of fighting necessary to reach a decision, thus reducing casualties and material costs. Second, deception can be used to elicit surrender, thereby avoiding conflict all together. Nathan Bedford Forrest used a ruse involving a notional secret weapon to successfully elicit the surrender of four Union blockhouses during the Civil War.[171] Finally, deception can be used in the retrograde to decrease the risk to the withdrawing troops. During the Korean War, 7th Division used the fact that the Chinese forces in the vicinity of Pork Chop Hill were conditioned to seeing armored personnel carriers resupplying U.S. forces on the crest of the hill. When the decision was made to withdraw the forces, rather than risk a night withdrawal, the forces were withdrawn using armored personnel carriers mimicking a supply run.[172]

5. Mislead the Target

"Deception is by itself an asymmetric approach to warfighting: tricking the opponent into misapplying strengths and revealing weaknesses."[173] A 1948 Department of Army memorandum on strategic and tactical cover and deception training provided ten specific examples of desired outcomes for deception operations (Table 3). These outcomes were divided into positive reactions—the target takes an action to its detriment--and negative reactions—the target fails to take an action to its detriment.

How deception can be used to mislead the target into not exploiting a weakness is illustrated by an example from the Vietnam War. A brigade commander was ordered to detach two battalions to support another operation, and the brigade commander realized that to do so would offer the Viet Cong an opportunity to exploit the reduction in forces

---

[172] U.S. Army Command and General Staff College, *Reference Book 31-40: Techniques for Deception* (Fort Leavenworth, KS: U.S. Army Command and General Staff College, 1976), p6-9 to 6-10.

[173] Scott Gerwehr and Russell W. Glenn, *The Art of Darkness: Deception and Urban Operations* (Santa Monica, CA: RAND, 1999), 10.

in his area of operations. In order to support the requirement while preventing the Viet Cong from seizing the advantage, the brigade commander directed support personnel to portray the advance parties of another division while spreading the rumor that the portrayed division would be assuming control of the area of operations. The combination of the portrayal and the ruse caused the Viet Cong to go to ground, denying them the opportunity to exploit the brigade's temporary loss of maneuver forces.[174]

Positive reactions by target to deception
1- Movement of reserves and their premature commitment to erroneous positions 2- Engagement by enemy in activities which exhaust his resources and/or prohibits their use elsewhere (i.e., extensive defensive preparations) 3- Dispersal or over-extension of enemy forces 4- Diversion of enemy thrusts 5- Disclosure of enemy positions
Negative reactions by target to deception
1- Failure to move reserves to meet intended offensives 2- Failure to exploit our weaknesses 3- Failure of counterattack 4- Failure to disengage 5- Failure to locate and act against true positions of artillery, reserves, dumps, etc.

Table 3. Examples of Target Responses to Deception.[175]

6. Relative Superiority

Relative superiority is the "condition that exists when an attacking force… gains a decisive advantage over a larger or well-defended force."[176] Deception, along with surprise and maneuver is an essential tool for gaining relative superiority.[177] Demonstrations and feints that draw away the defender's reserves from the point of decision assist in the achievement of relative superiority. The aspects of Operation FORTITUDE that caused the German command to retain forces in Pas de Calais even after the Normandy landing assisting in the Allies gaining and maintaining relative superiority

Page 769 of 3957

at the Normandy beachhead. Use of deception to bait a superior force into an ambush is time honored technique used by inferior forces to gain relative superiority.

7. Security

Deception can be a vital asset for maintenance of security. "Real secrecy can only be achieved if, in addition to the correct information which the enemy receives, he is also provided with incorrect information. Confusion is the only effective method of maintaining secrecy."[178] This is especially true for irregular warfare and intelligence operations. Deception in support of security typically relies heavily on camouflage and denial. In addition to the cover aspects, ruses in the form of cover stories and notional documents are used frequently. Status for cover and status for action are terms for the cover stories developed to protect intelligence operatives and facilitate their missions. MACVSOG utilized a set of cover stories for the overall organization, subordinate elements, and even missions in an effort to obscure its activities.[179] The cover for status of MACVSOG stated the organization was simply a special staff section focused on the comprehensive study of counterinsurgency operations, with no implementation authority.[180]

8. Subversion

Subversion is defined as: "Action designed to undermine the military, economic, psychological, or political strength or morale" of a targeted organization.[181] Deception can be used in a subversion role, by exploiting internal cleavages within the targeted organization in order to foment mistrust and discord. In addition to mistrust and discord,

[181] This definition is modified from the official definition by substituting targeted organization for regime in order to allow for targeting of non-state actors. Headquarters, Department of the Army, *Field Manual 1-02*, 1-178.

subversive deception can be used to introduce friction into the target's decision cycle and actions; thereby, reducing the overall effectiveness of the target.[182] Subversion by deception may be particularly effective when used against organizations sensitive to internal threats; such as, networked terrorist groups and authoritarian regimes. MACVSOG's use of poison pen letters to increase distrust within the North Vietnamese leadership is an example of deception to achieve subversion.[183]

9. Mental Isolation

Deception Mental isolation occurs when the target is unable to perceive or make sense of the situation.[184] The ultimate goal of mental isolation is to reduce the target to passivity or paralysis as the target is unable to appreciate or cope with the practitioner's actions.[185] Deception in support of mental isolation seeks to create an impenetrable fog of war through camouflage and denial, while increasing uncertainty and ambiguity by the presentation of conflicting information through what channels the target retains access to.[186] The effective mental isolation and subsequent paralysis of a target can negate the target's fighting power and thus ability to resist.[187] During the Six-Day War, Israeli Military Intelligence attempted a form of mental isolation against Arab forces. Operation FOG OF BATTLE "misled top enemy commanders, drew them into traps, diverted their forces in the wrong directions, spread confusion and chaos within upper level enemy headquarters, and speeded up the process of demoralization and disintegration of the channels of command."[188]

---

[182] Friction is defined as "the accumulation of chance errors, unexpected difficulties, and the confusion of battle." Headquarters, Department of the Army, *Field Manual 100-5, 1986*, 16.

E. COMMUNICATIONS PROCESS OF DECEPTION

1. Overview of Communications

In order to understand deception, it is necessary to look at the context in which deception is practiced. Of importance to the understanding of deception are the communications environment and the target's decision-making process. Roberta Wohlstetter's *Pearl Harbor: Warning and Decision* provides insight to the role of noise within the communications process. Wohlstetter defines noise as competing or contradictory signals that are useless for understanding a situation.[189] William Reese's "Deception within a Communications Theory Framework" presents an overview of communications theory that is critical to understanding the process by which information is transmitted from the practitioner to the target. Reese includes in his work the roles of channels and indicators; as well as, the ways by which errors enter the process.[190] Whaley and Bell's collaboration *Cheating and Deception*; as well as, Bell's "Toward a Theory of Deception" discuss how deception works through communication.

Deception occurs within the framework of communication (Figure 6). An actor is constantly emitting indicators of his actions, capabilities, and intentions into the environment, and is likewise constantly receiving indicators from other actors. Indicators travel from one actor to another via channels. Some indicators are not perceived by the target due to the lack of a viable channel to convey the information. Other indicators are corrupted by errors of encoding, transmission, or decoding. The corruption of indicators is a form of noise. The indicators an actor receives from other actors in the environment constitute another form of noise. The limited set of indicators that do reach the target are what the target relies on to form the perceptions of the practitioner for use in the target's decision-making process. Because the target does not have access to all the indicators of the practitioner, the target never has a complete picture of the actor's intentions, capabilities, and actions.

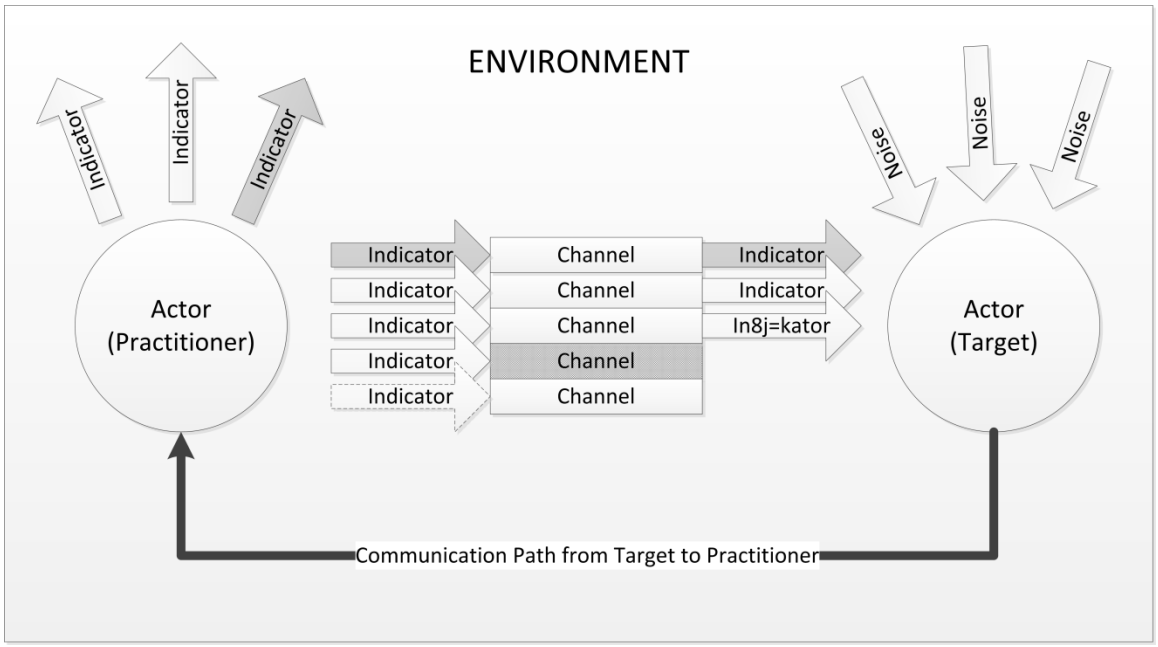

Figure 6. Communications Cycle

As Figure 6 shows, deception works within the communications process. The practitioner is constantly emitting indicators of his actions into the environment. Some indicators are not seen by the target as there is no channel to convey the indicator to the target. The white indicators represent indicators of the practitioner's true capabilities and intentions. The grey indicators represent deceptive indicators. The dashed line indicator represents an indicator obscured through cover means. The In8j=kator indicator represents an indicator corrupted by errors in encoding, transmission, or decoding. The cross-hatched channel is a channel closed through denial means. Finally, the noise arrows represent indicators from other actors or the environment that interfere with the target's perception of the practitioner's indicators. The process depicted is one-half of the complete communications process. There is a mirror process running from the target to the practitioner as indicated by the black arrow.

2. Indicators

Indicators are individual snippets of information about the capabilities, intentions, and actions of an actor created through the actor's interaction with the environment. Indicators can take myriad forms and include exercises and training events; personnel and

equipment movements; updates on social network sites and other communications activity; and solicitations for contracts.[191] These pieces of information can be real or deceptive. The purpose of deceptive indicators is to provide the target with the information required for the target to draw the conclusion that the deception story is reality.

Indicators, whether real or notional, are subject to errors in encoding, transmission, and decoding. Errors in encoding occur at the origin of the indicator and may result from typographical or syntax errors, improper execution of guidance, and translation errors. For example, a notional identification document with an outdated stamp is an error in encoding. Errors in transmission alter the indicator as it transits a channel from the transmitter to the receiver and can occur due to noise causing corruption, interaction with the channel causing changes to the indicator, or the failure of the channel to pick up the indicator. Technical faults in the target's reconnaissance plane resulting in indicators of troop movements not being observed is an example of an error in transmission. Errors in decoding enter the indicator as it is being processed by the receiver, and can include mistakes in interpretation and failures in perception. An imagery analyst mistaking a tank for a truck is an error in decoding.[192]

3. Channels

Channels are "the specific ways in which information about a given subject reaches an audience."[193] For deception, the most commonly used channel is the intelligence collection capabilities of the target. Intelligence channels consist of the suite of intelligence collection capabilities, e.g., human, signals, open source, and imagery. Examples of intelligence channels range from the double agents used by Britain in World War II as part of the Double Cross system to notional radio traffic.[194] In addition to

[191] To reinforce the variety of indicators, one—possibly apocryphal—indicator of crisis planning at the White House is said to be late night pizza deliveries.

[192] Reese, *Deception within a Communications Theory Framework*, 99 – 114.

[194] Abram Shulsky, "Elements of Strategic Denial and Deception," in *Strategic Denial and Deception: The Twenty-First Century Challenge*, eds. Roy Godson and James J. Wirtz (Piscataway, NJ: Transaction Publishers, 2002), 19 – 26.

intelligence collection channels, there are many other channels for indicators to reach the target (Table 4). One of the goals of cover is to reduce the number of channels available to adversarial intelligence collection, as restricting channels makes the intelligence collection more dependent on the remaining channels, and reduces the likelihood of indicators of the actual plan reaching the target. Channels can be preexisting or created in support of the deception plan. The use of a corpse by British intelligence during WWII to convey notional plans to German intelligence is an example of a created channel.

Intelligence	Human, Signal, Imagery, Measures, Electronic
Traditional Media	Newspapers, Radio, Television, Handbills, Leaflets, Loudspeakers
Internet	Social Media Sites, Commercial Email, Notional Sites
Military Communications	Radio, Official Email, Orders, Radar
Diplomacy	Negotiations, Communiques, Official statements
Other	Word-of-mouth, Surveys, Telephone

Table 4. Examples of Channels

4. Deception's Role in the Communications Process

In addition to deception operating within the communications framework, deception affects the communications process itself on a number of levels. Indicators can be camouflaged to prevent the target from recognizing the indicators. Alternatively, indicators can be reduced through various security measures. Channels can be closed off via denial capabilities. For indicators that cannot be hidden from the target by cover tools, simulations and portrayals can be used to drown the indicator in a sea of noise.

F. DECEPTION AND TARGET DECISION-MAKING

To understand how deception affects the target, it is imperative to understand how decisions are made. Decision-making is not a rigid process of whereby two individuals can see the same indicator, reach the same conclusion, and act the same way; rather, decision-making is subject to numerous schemata—cultural, personal, and cognitive—the

composite of which is unique to every individual. Colonel John Boyd's "Organic Design for Command and Control" introduces a framework for the decision-making process, the Observe-Orient-Decide-Act (OODA) loop.[195] The OODA places decision-making in an iterative process where perceptions are created by the synthesis of new information and existing perceptions through the schematic lenses. From the revised perceptions, decisions are made, driving actions and inaction. While Boyd includes the lenses in his decision-making framework, he does not go into depth discussing how culture, personal experiences, and genetic heritage impact decisions.

Richard Heuer's *Psychology of Intelligence Analysis*, though intended as a tool for intelligence analysts contains a trove of information for the deception practitioner. Of particular use is Heuer's discussion of cognitive biases. Cognitive biases are defined by Heuer as "mental errors caused by our simplified information processing strategies… a cognitive bias does not result from any emotional or intellectual disposition towards a certain judgment, but rather from subconscious mental procedures for processing information."[196] Heuer categories the cognitive biases by their effect on intelligence analysis: "evaluation of evidence, perception of cause and effect, estimation of probabilities, and retrospective evaluation of intelligence reports."[197]

Michael Bennett and Edward Waltz's *Counterdeception Principles and Applications for National Security* expands the discussion of biases by adding three additional categories: personal, cultural, and organizational. Personal biases "are the result of personality traits and the firsthand experiences that affect a person's world view throughout the course of their life."[198] Cultural biases are "the result of interpreting and judging phenomena in terms particular to one's own culture and is influenced by the knowledge, beliefs, customs, morals, and habits, and cognitive styles that are acquired as

a member of one's specific social environment."[199] Organizational biases are "the result of the goals, mores, policies, and traditions that characterize the specific organization in which the individual works."[200] Bennett and Waltz's expansion of biases increases the number of potential levers a deception practitioner has to influence the deception target.

In order to explore how deception affects the target, an expanded version of the OODA process is used to represent the target's decision-making process. The OODA process consists of four interconnected phases: observe, orient, decide, and act (Figure 7)

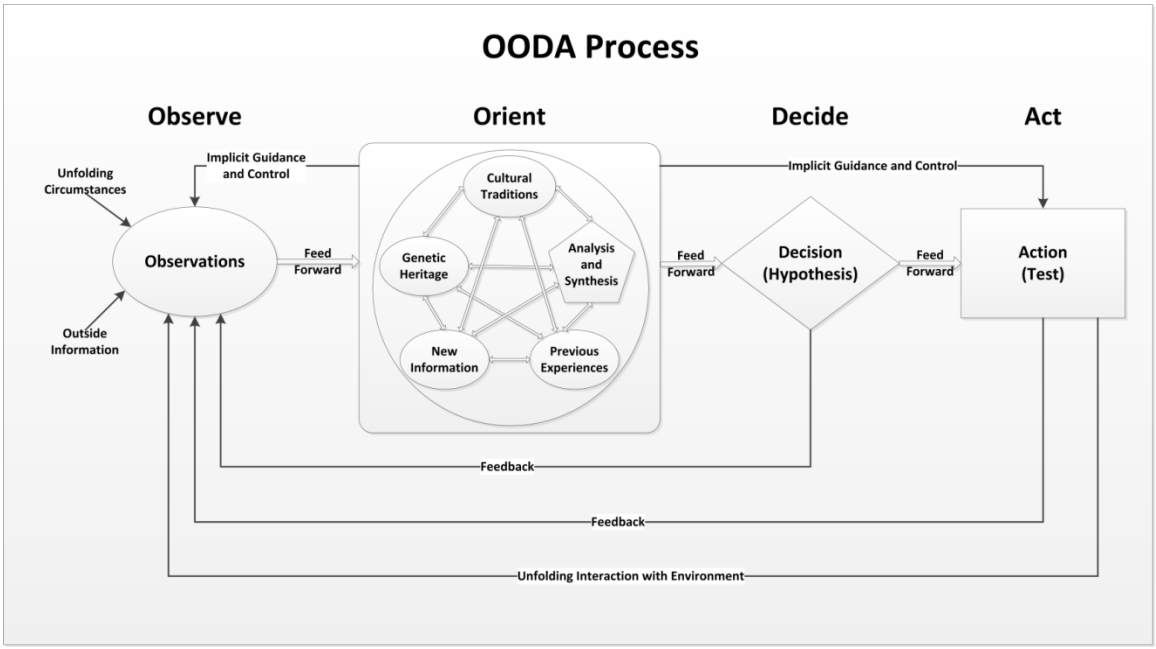

Figure 7. Expanded OODA Process (From: [201])

1. Observe

During the observe phase, the target interacts with the environment, actively and passively collecting indicators in an effort to gain an understanding of the situation. Despite the wishes of every actor, it is impossible to collect a perfect picture of the situation as some indicators are missed and others corrupted by transmission and coding

199 Bennett and Waltz, *Counterdeception Principles*, 72.

errors. The inability to perceive the total picture is the "fog of war." Additionally, the target's existing perceptions of the environment and situation affect which indicators the target observes.[202] As Thomas Kuhn states: "What a man sees depends both upon what he looks at and also upon what his previous visual-conceptual experience has taught him to see."[203] It is during the observation phase the deception practitioner interacts with the target. Through camouflage, indicators of friendly activity are obscured from target collection. Furthermore, through denial, target collection channels are closed off, preventing the collection of unobscured indicators—both friendly and other actor. Finally, through active deception, manipulated or manufactured indicators are presented for collection, which taken together tell the deception story. Through these means, the fundamental effects of deception in the observe phase are to either thicken the fog of war by increasing ambiguity or uncertainty by obscuring indicators, or to part the fog of war by seeming to decrease ambiguity or uncertainty through the presentation of indicators revealing a misleading picture of the situation. It is necessary to understand the collection capabilities of the target in order to increase probability of reception of the manipulated indicators; as well as, to prioritize camouflage and denial activities towards protecting vulnerable indicators. Equally important is an understanding of what the target expects to see from the practitioner; in other words, the practitioner needs to develop a detailed understanding of self through the lens of the target.

2. Orient

After the observe phase, the target transitions to the orient phase. During the orient phase, the target processes the collected indicators through a series of schemata and synthesizes the result with the target's existing perceptions to create revised perceptions of the environment and situation. Schemata are defined as: "…the dynamic, cognitive knowledge structures regarding specific concepts, entities, and events used by

---

[202] Heuer, *Psychology of Intelligence Analysis*, 8 – 10.

[203] Thomas Kuhn, *The Structure of Scientific Revolutions*, 3rd ed. (Chicago: University of Chicago Press, 1996), 113; This is an important point; an engineer, infantryman, and helicopter pilot looking at a wooded glen will *see* different things. The engineer may see the glen in terms of soil substrate suitability for a road; the infantryman may see the glen in terms of cover, concealment, and avenues of approach; while the pilot sees in terms of potential landing zones.

Page 778 of 3957

individuals to encode and represent incoming information efficiently."[204] These schemata create biases in the way the target perceives and processes information. Schemata can be categorized as cultural, personal, and genetic. Cultural schemata include the collective experiences, legacies, biases, and heuristics developed by organized groups. Personal schemata include personal experiences and the resultant biases and heuristics. Genetic schemata include the cognitive biases and heuristics developed through conflict based natural selection. Schemata and the resultant biases can both aid and hinder deception efforts.

a. Cultural Schemata

Cultural schemata are the collective set of knowledge, beliefs, experiences, values, and norms for a distinct aggregate of people with similar characteristics, e.g., state, ethnic group, region, religion, and organization. A target can be influenced by several different sets of cultural schemata, for example, a Sunni Muslim Iraqi Kurd is influenced by the schemata for his Sunni Islam, Iraqi, and Kurdish aspects. While members of a particular culture are not perfectly uniform in their cultural schemata, understanding the culture of the target is vital to the success of deception. Culture can be a source of trappings for a deception to increase its legitimacy, for example, the Sacred Sword Patriots League deception in Vietnam was based in a Vietnamese legend of a divine sword given to a prince to drive out the occupying Chinese.[205] Additionally cultural biases can impact the credibility given to different channels. For example, in a country without a tradition of free press, there may be less credibility given to traditional media channels. Likewise, in societies with a strong oral tradition; such as Arab societies, word of mouth channels may have higher credibility than in societies without a strong oral tradition. Understanding the degree to which a culture values certain channels can help in deciding which channels to priorities for exploitation or denial.

Harris, "Organizational Culture and Individual Sensemaking: A Schema-Based Perspective," *Organization Science* 5, no. 3 (August, 1994), 310.

[205] Shultz, *The Secret War Against Hanoi*, 139 – 140.

Much like the social groups, organizations possess a distinct set of schemata that influence information processing. These schemata in turn generate organizational biases. An example of an organizational bias with applicability to deception operations occurred in the Burma Campaign of World War II. The Japanese command in Burma did not trust its intelligence analysts. British efforts to deceive the Japanese commander failed because of this bias against the intelligence analysts, the deception indictors presented by the British never impacted the Japanese commander's decisions.[206] A second example of organizational schemata impacting deception, this time to negative results, occurred as part of British plans to invade Italian controlled Abyssinia [Ethiopia]. The British plan called for an attack into northern Ethiopia, and a deception to make it appear the attack would come from the south. The British successfully deceived the Italians into believing the attack would come from the South; however, the British failed to account for the Italian Army's desire to avoid combat. Rather than reinforcing the southern approaches to repulse the perceived British offensive, the Italians withdrew northward, towards the actual British offensive.[207] [This episode led to Dudley Clarke's admonishment to plan deception in terms of the target's actions, and not the target's perceptions]

b. Personal Schemata

Whereas the cultural schemata are the result of the social environment, personal schemata are the result of the one's experiences, motivations, and emotions. Four variables impacting the degree to which an experience might affect an individual's worldview: whether the experience was first hand; how early the event occurred in the individual's lift; how important the consequences of the event were to the individual or his nation; and whether the individual has a sufficient range of experience to develop alternative perceptions.[208]

[208] Robert Jervis, *Perception and Misperception in International Politics* (Princeton, NJ: Princeton University Press, 1976), 239.

Within the context of deception, personal create exploitable vulnerabilities. For example, the paranoia of Stalin about internal security threats created a vulnerability which German intelligence exploited by creating a set of notional dossiers detailing Soviet officers' interactions with German intelligence officers. In a brilliant move, the dossiers were not created from scratch; rather Abwher used dossiers from an actual episode of German-Soviet military cooperation in 1927 as the basis for the notional dossiers. By modifying existing documents, Abwher managed to expediently create dossiers with an air of believability—the best deceptions are built on truth. While it cannot be proven the deception led to the subsequent purge by Stalin of not only the officers in the dossiers, but over 20,000 personnel, including a majority of senior leaders, the timing would seem to indicate a connection. The decimation of the Soviet armed forces during the 1937–1939 purge significantly reduced the effectiveness of the Soviet armed forces prior to Operation BARBAROSSA.[209]

c. Cognitive Biases and Heuristics

Cognitive biases and heuristics are what the OODA loop considers to be genetic heritage; that is cognitive biases and heuristics have developed through natural selection. There are many cognitive biases and heuristics; the ones most pertinent to deception are: small numbers, anchoring, confirmation, Rubicon, and availability.

Small numbers bias, also known as representativeness, is the tendency to overestimate the reliability of a small sample to be representative of the total set. Furthermore, this bias creates overconfidence in observed patterns and early trends. Taken together, this means that the perceptions of individuals are created by a smaller set of information than is thought.[210] Deception benefits from the small number bias by lessening the number of indicators needed to generate the required perception. However, the small numbers bias also increases the difficulty of shifting initial perceptions.

Page 781 of 3957

Anchoring heuristic also impacts how an individual adjusts an existing perception based on new information. There is a tendency for the starting perception to act as friction on any adjustments so that the adjusted perception may be closer to the starting position than appropriate.[211] Anchoring's importance to deception is twofold. First, anchoring reinforces the maxim that deceptions should use the target's existing perceptions. Second, anchoring indicates a need to ensure when deception is in support of a specific plan that the deceptive indicators are transmitted before indicators of the actual plan begin transmission.

Confirmation bias exhibits itself in the tendency of individuals to interpret new information in ways supportive to the individual's established perceptions.[212] Confirmation bias is one reason why deceptions that exploit existing target perceptions are preferable to deceptions that seek to change target perceptions. Additionally, confirmation bias is another reason to seek to implement deception prior to the target forming its initial perceptions. If the initial perceptions are formed relying on deceptive indicators, then confirmation bias will generally work to support the deception.

Rubicon bias is the tendency of individuals to place greater confidence in a decision once the decision is made. Prior to making a decision, an individual tends to evaluate the benefits, costs, and risks of the various options in reasonably deliberative manner—subject to the lenses of personal experience and other biases and heuristics. However, once a decision is made, the individual tends to view that decision as being the best possible decision.[213] Along with confirmation bias, the Rubicon bias suggests that deceptions should seek to leverage existing perceptions; rather than seeking to create new perceptions.

The availability heuristic expresses itself in the tendency of a person to evaluate the likelihood of an event based on "…the ease with which they can imagine

---

[212] Thomas Gilovich, *How We Know What Isn't So* (New York: The Free Press, 1991), 33.

[213] Dominic Johnson and Dominic Tierney, "Crossing the Rubicon: The Perils of Committing to a Decision" (Cambridge, MA: Belfer Center for Science and International Affairs, Harvard Kennedy School, 2011).

relevant instances of the event and the number or frequency of such events that they can easily remember."[214] In addition to recall, the availability heuristic also depends on the ability of a person to imagine an event. The availability heuristic impacts deception on several levels. First, since successful deceptions are often related to significant events, the availability heuristic can cause the perception of deception where none exists. Next, since the availability heuristic relies on recall and imagination, deception can be used to reduce or increase the perceived probability of an event. Finally, since the availability heuristic utilizes the probable, deception can be used to protect the unexpected by providing plausible explanations; for example, protecting human agents by attributing collected information to signals intelligence assets.

d. Results of Orientation

The results of the orient phase are revised perceptions of the situation and environment that are fed into the decide phase. Gaps in information identified during the analysis and synthesis can result in new requirements for the observe phase. Additionally, the revised perceptions impact how the expectancy bias affects the collection of new information. Successful deception corrupts the outputs of the orientation phase causing the target to perceive the situation as the deceiver intends.

3. Decide

Once the indicators are synthesized and analyzed, and the target's revised perception of the situation is created, the process transitions to the decide phase. During the decide phase, the target uses his perception to develop his courses of action. This phase marks the transition of the target from a deliberative mind-set to an implementation mind-set.[215] In addition to the decide phase feeding forward into the act phase, feedback from the decision phase feeds back into the observe phase as new information requirements.

---

[214] Bennett and Waltz, *Counterdeception Principles*, 102.

[215] Johnson and Tierney, "Crossing the Rubicon," 1.

4. Act

Finally, the chosen courses of action are implemented. These activities create indicators via interaction with the environment. It is at this point a successful deception plan reaches fruition though the target's implementation of the decided actions or inactions based on the manipulated perception. If the deception story is accepted and acted upon, there should be evidence in the indicators created by the target's activities. While indicators of successful deception are important, equally as important are indicators of deception failure; the deception practitioner should seek to collect indicators looking for feedback that the deception did not work.

G. DECEPTION PROCESS

1. Bell and Whaley

Bell and Whaley present the deception process as a deception planning loop that begins with the development of a desired deception goal in support of the strategic goal. The first half of the loop is the decision sector where the potential stratagem, illusion, channel, ruse, and characteristics are considered. The second half of the loop, the perception sector, executes the characteristics to drive the ruse through the selected channel in order to generate the intended illusion to activate the chosen stratagem to achieve the deception goal[216] (Figure 8). Bell and Whaley's process is demonstrated using their example from *Cheating and Deception* in figure 9. Bell and Whaley's deception planning process is thorough, but falls short of its potential. One key shortcoming is that the process ends with what the target thinks, rather than what the target does. This runs the risk of the target thinking what the deceiver desires, but not acting in the desired way.

[216] Bell and Whaley, *Cheating and Deception*, 71.

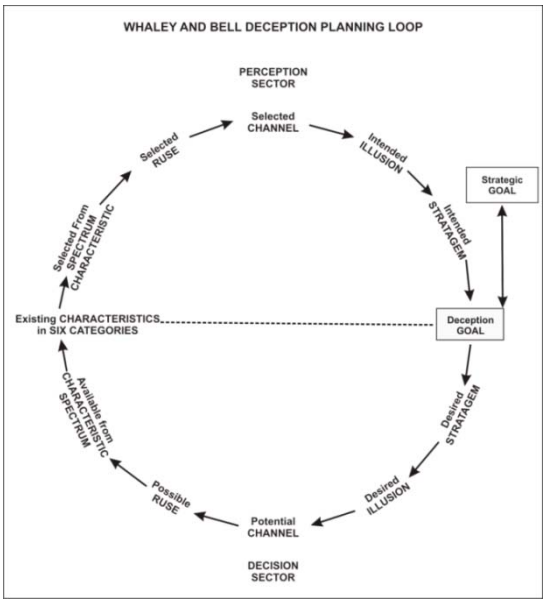

Figure 8. Bell and Whaley's Deception Planning Loop (From: [217])

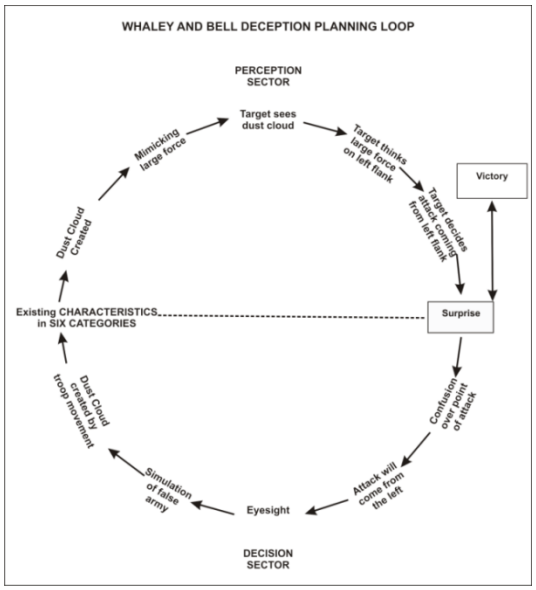

Figure 9. Example of Bell and Whaley's Deception Planning Process in Action (From: [218])

[217] Bell and Whaley, *Cheating and Deception*, 71.

[218] Bell and Whaley, *Cheating and Deception*, 70 – 72.

2. See-Think-Do

An alternate deception process is articulated in *Joint Publication 3-31.4: Military Deception*. *JP 3-13.4* utilizes a three step deception process: See-Think-Do. In the See-Think-Do model, the deception practitioner first decides what action or inaction the target must do in order to support the overall plan. This behavior becomes the deception objective. Next, the practitioner considers what the target must think in order to cause the deception goal. Finally, the practitioner formulates what the target must see in order to create the necessary perceptions to drive the target's thoughts. The set of indicators the target needs to see becomes the deception story.[219] While this process offers a direct, to the point, tool for deception planning, the model oversimplifies the complexities of target decision-making.

3. Revised Deception Process

Merging Bell and Whaley's deception planning loop together with the See-Think-Do process in the context of the communication and decision-making frameworks provides a potentially fuller understanding of the deception process (Figure 10) The process starts with the identification of a strategic, operational, or tactical objective, e.g., establish a beachhead on the mainland of Europe. From this objective a deception objective is derived, e.g., German forces reinforce Pas de Calais, leaving Normandy thinly defended. Potential deception objectives must be feasible, that is, the target must be capable of performing the action or inaction, and the action or inaction must be reasonable. Once the deception goal is determined, the next step is to evaluate what the target must think in order to drive the desired action, e.g., Pas de Calais is the Allied objective. This phase corresponds to the orient and decide stages of the OODA process. Critical to the determination of what the target needs to think is the knowledge of what the target already thinks; as well as, what cultural, organizational, and personal schemata influence the target's decision-making. In the case of the example, knowing the Germans already viewed Pas de Calais as the likely landing zone greatly aided the deception

[219] Joint Staff, *JP 3-13.4: Military Deception*, (Washington, DC: Department of Defense, 2006), pIV-1 to IV-2.

Page 786 of 3957

process. Likewise, had this phase revealed the Germans viewed Normandy as the most probable target the entire deception, and in deed the entire plan, would have to be reevaluated.

After the desired perception is decided, then the set of indicators necessary to create the perception must be designed, e.g., feints in the form of bombing and reconnaissance flights over Pas de Calais; disinformation through DOUBLE CROSS system; and simulated Allied forces staging across the English Channel from Pas de Calais. This set of indicators is what will paint the deception picture for the target to see. Again it is vital to understand what the target already perceives, as the existing perception not only drives how new indicators are interpreted through filters like the expectancy and confirmation biases, but also what the target sees the indicators as. Additionally, the channels available for the target to receive indicators must be identified, and of those channels which will be denied the target. Finally, based on the analysis of the available channels, and the indicators needed for the deception story, a prioritized set of indicators of the actual plan lays out what must be hidden from the target. In the example, many of the indicators of the Normandy Invasion did not contradict the Pas de Calais deception, and thus did not need to be covered; such as, the airborne training operations, and the general build up of materials and personnel. This allowed cover efforts to focus on protecting critical indicators like the Mulberry harbors. Once the deception plan is implemented, collection of enemy indicators is essential. These indicators help the deceiver to determine if the deception succeeded or more importantly if it failed.

Page 787 of 3957

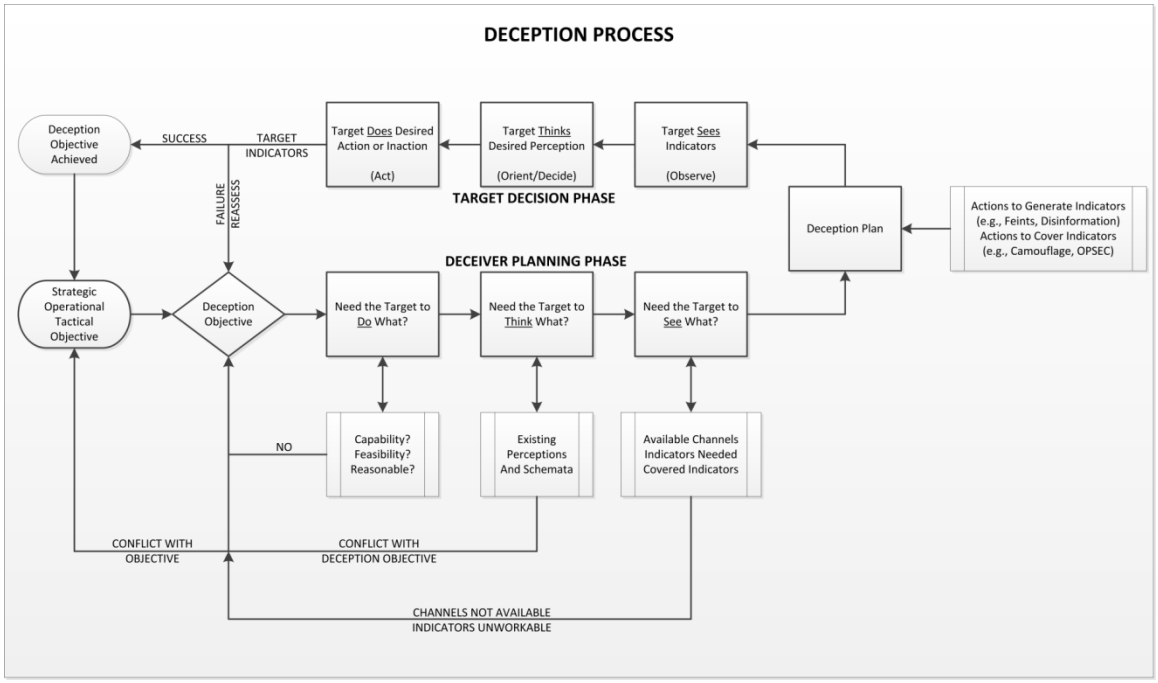

Figure 10. Revised Deception Process

V. PRACTICE OF MILITARY DECEPTION

> *I feel that deception and cover plans or operations are fully justified and that the employment of cover and deception should . . . be an accepted and organized procedure for any campaign.*
>
> *– General George S. Patton*[220]

FM 90-2: Battlefield Deception provides a five-step deception planning process. Step one—situation analysis—focuses on friendly and enemy situations, target analysis, and a stated desired situation. Step two—deception objective formulation—consists of determining the five w's of the deception objective: what action/inaction is necessary to achieve the desired situation; who must perform the action/inaction; when and where must they act; and who must be affected. Step three—desired perception—develops an idea of what the enemy must think to make him act in the desired manner, and what perceptions must be created in order to persuade the enemy to think in the desired way. Step four—deception story—generates the information that when conveyed to the target paints the perception picture for the target. Step five—deception plan—focuses on producing the overall plan for how to convey the necessary information to the enemy, as well as the recommending the intelligence requirements to look for indicators that the plan is working or not.[221]

FM 3-13: Information Operations provides a five-step deception planning process designed to nest within the Army's military decision making process [MDMP]. The steps to the process as outlined in *FM 3-13* are: receipt of the mission; mission analysis; course of action development; course of action analysis, comparison, and approval; and orders production. Though the names are different than the steps in *FM 90-2*, the processes within the steps are very similar. In addition to the planning process, *FM 3-13* provides guidance on the preparation, execution, and assessment of the deception plan. Interestingly, the initial iteration of the information operations field manual, *FM 100-6*, published in 1996, did not contain a discrete deception planning process.

---

[220] Quoted in Center for Army Lessons Learned, *CALL Bulletin 3-88*, 7.

[221] Headquarters, Department of the Army, *Field Manual 90-2: Battlefield Deception*, 4-4 to 4-15.

JP 3-13.4: Military Deception, provides a six-step deception planning process based on the Joint Operation Planning and Execution System [JOPES]. The six steps are: deception mission analysis; deception planning guidance; staff deception estimate; commander's deception estimate; deception plan development; and deception plan review and approval.[222] The content of these steps is similar to the steps in *FM 90-2* and *FM 3-13*, with the addition of the SEE—THINK—DO methodology.

In addition to the preceding examples of doctrinal deception planning, there is a vast body of official and unofficial research addressing the planning and practice of deception. Exemplars of the official research include the CIA Deception Research Program's *Deception Failures, Non-Failures and Why* and *Deception Maxims: Facts and Folklore*; the U.S. Army Research Institute for the Behavioral and Social Sciences' *Doing Deception: Attacking the Enemy's Decision Processes*; and Hans von Greiffenberg's *Deception and Cover Plans Project #29*, which analyzes German deceptions during World War II. Representative of the unofficial research is Benjamin Higginbotham's "On Deceiving Terrorists," which looks at using deception against non-state actors.

Finally, there are a number of historic accounts of deception planning and execution to draw from, with much of the work covering the World War II era. For example, Roger Hesketh's *Fortitude* represents the official history of the London Control Section's pinnacle operation. Similarly, the *Official History of the 23rd Headquarters Special Troops* details the unit's creation and conduct of tactical deception in the European Theater of Operations. David Mure's *Master of Deception* covers Dudley Clarke's A-Force in North Africa, and includes a memo from Clarke outlining his thoughts and observations on deception. Anthony Cave Brown's *Bodyguard of Lies* is a massive tome covering nearly the totality of Allied deception, espionage, and clandestine operations in the European Theater of Operations. The critical value of these works is their discussion of deception in real world application—outside the realm of theory.

Page 790 of 3957

A. DECEPTION PLANNING PROCESS

The 2012 edition of JP 3-13.4 utilizes a six-step process for planning deception: deception mission analysis, deception planning guidance, staff deception estimate, commander's deception estimate, deception plan development, and deception plan review and approval.[223] This planning process will serve as the framework for the discussion of deception planning, with modifications derived from other works.[224]

1. Mission Analysis

The current U.S. military guidance on planning military deception has the military deception process overlaid on either MDMP or JOPES planning processes. This is not sufficient. Aspects of military deception planning must occur before the beginning of formal planning, and ideally the introspective analysis of friendly forces should be a continuous process even prior to receipt of a mission. For example, development of profiles of potential target leaders must be integrated with ongoing intelligence preparations, so that when the planning process begins this vital groundwork is already in place. Additionally, a firm understanding of friendly force indicators is necessary in order to plan on how to cover critical indicators; as well as, determining what indicators are necessary to create the perception of particular activities, e.g., the indicators created by pre-deployment preparations. These friendly force indicators should be collected and analyzed during routine garrison operations, field training, and actual missions.

a. Information Requirements

Information requirements for deception operations are complex, but not overwhelming. "In developing such [deception] plans the commander must visualize and understand the enemy viewpoint…."[225] As *TC 30-1* states:

---

[223] Joint Staff, *JP 3-13.4*, IV-4 to IV-14.

[224] This discussion is not meant to prescribe the way to plan and execute deception operations; rather, this section is meant as a discussion of the broad concepts associated with planning and execution.

[225] Headquarters, Department of the Army, *FM 100-5: 1962*, 50.

> Success of cover and deception is dependent on the ability of the deceiver to predict the probable enemy reaction. The staff charged with the deception planning must be able to think as the enemy does and not react as a friendly commander transplanted into the enemy situation. This is possible only as a result of a thorough understanding of the enemy, his culture, and military system. The enemy intelligence system must be evaluated because this system is the vehicle that carries the deception story to the enemy commander. Determination must be made regarding the enemy's characteristics, his habits that make him vulnerable to deception, and those aspects that present the least likely deception target. …if possible, we should know the characteristics of the enemy commander, to include the degree of freedom allowed subordinates, his reaction time to new situations, and how this fear of the unknown influences his actions. A single known characteristic of a commander is more important than the entire statistical record of his military career.[226]

Note, while *TC 30-1* talks in terms of the "enemy commander," it is important to realize when targeting non-hierarchal organizations such as networked non-state actors, the target may not be a "commander;" rather, the target may be someone like a low level leader, key financier, or technician. Additionally, the target may not be an "enemy" at all. As stated previously, enemies, adversaries, neutral parties, and even friendly parties are viable targets of deception, though the risk versus benefit calculations when looking to deceive neutral and friendly parties must be examined closely.

The practitioner must also have knowledge of the channels available for both real and deceptive indicators to reach the target; as well as, what channels are available for the collection of feedback in order to assess the deception operation's effectiveness. The deception practitioner should take every effort reasonable within the constraints of time and resources to develop a full understanding to the target. Fortunately, there are several products generated by others which are useful in the practitioner's analysis (Table 5).

[226] Headquarters, Department of the Army, *Training Circular No. 30-1*, 15

Table 5. Sample Deception Planning Resources

Not only must the practitioner understand multiple targets' personal characteristics, organization, and culture, the practitioner must also know his own organization in order to have a firm grasp of the indicators the organization generates, specifically the indicators comprising critical information. Critical information is the set of indicators that if pieced together could reveal the friendly force plans, capabilities, and intentions. The list of critical information should normally be produced by the OPSEC officer. A thorough knowledge of friendly forces is required as well for effective portrayals and simulations. One of the critical tasks for the 23rd Headquarters Special Troops was the reconnaissance of friendly formations. The signals units collected "…an unequalled library of combat [Standard Operating Procedures], [Signal Operating Instructions], and radio peculiarities." Likewise, the 603rd Combat Engineers studied unit "atmospherics" and collected samples of unit patches, command post signs, and bumper markings to facilitate the impersonation of any unit in the 12th Army Group.[227]

The degree to which a practitioner needs to understand his own unit means this requirement cannot wait for a specific mission. Ideally, the practitioner's estimate of the

[227] *Official History of the 23rd Headquarters Special Troops* (Photocopy from National Archives), 9.

Page 793 of 3957

friendly forces should be a continuous process, carried out in garrison, training, and actual operations. For this, military deception planning must also be continually nested with operations security planning. Understanding the myriad indicators an element on the move generates, prior to the start of formal mission planning, allows the military deception planner to implement early in the process the necessary cover plans to mask real indicators and the necessary deception plans to show the required false indicators. Waiting until the beginning of the formal planning process to start will result in delays that could allow the indicators of the real plan to be received by the target before the military deception plan is even implemented.

All the information is compiled into a deception estimate. Drawing from various sources, suggested elements of the deception estimate include:

- Potential target decision makers, to include biographical data and psychological profiles
- Existing preconceptions about friendly plans, capabilities, and intentions
- Target organization for systems of decision-making, information flow, and command and control; as well as, organization structure
- Target intelligence capabilities in order to identify channels
- Target potential plans, capabilities, and intentions
- Friendly force plans, capabilities, and intentions to identifying indicators
- Friendly force critical information
- Friendly force characteristics; such as, unit designations, leaders, insignia[228]

2. Planning Guidance

Deception planning guidance from the commander should focus on the deception goal: what the commander wants the target to do, or not to do. Identification of the deception goal must be accomplished as early as possible in the planning process so that the deception plan has sufficient preparation and execution time to allow the target opportunity to take the desired action prior to the execution of the actual plan.[229]

---

[228] Headquarters, Department of the Army, *Training Circular No. 30-1*; Joint Staff, *JP 3-13.4*; *Official History of the 23rd Headquarters Special Troops.*

[229] Headquarters, Department of the Army, *Training Circular No. 30-1*, 13.

Part of the planning guidance is an analysis of the risks and benefits for the various aspects of deception. Deception should be considered for all operations, and cover aspects always implemented, as FM 100-5 (1954) states: "…deception is a continuing action carried out by all echelons of command in activities such as cover and concealment, individual combat, use of dummy positions and installations, and decoys."[230]

There are situations where active deception may not be appropriate, or where deception should focus on supporting operations security and force protection instead of offensive operations. *Reference Book 31-40* recommends the following questions be considered in order to determine whether active deception should be implemented:

- Is the… situation such that the [target] is susceptible to deception?
- Is there a logical opportunity for deception?
- Are there resources, to include time, available to support the deception?
- Is the [target] likely to react in the desired manner in this situation?[231]

The final decision on when and how to implement deception rests with the commander.

3. Planning Methodology

a. DO

With the deception objective identified, the next step is the development of the deception story. The story should be developed using the SEE—THINK—DO methodology.[232] Backwards planning with this methodology starts with the DO step. This step takes the deception objective and couples it with a specific target. The result is phrased in terms of what the specified target does or does not do—this correlates to the act phase of the OODA decision-making process discussed in Chapter IV. For example, a deception objective might be: "Republican Guard commander keeps his forces in vicinity of Kuwait City." The deception objective must be evaluated in terms of capability, reasonability, and feasibility. If these criteria are not met then the deception objective or

[230] Headquarters, Department of the Army, *FM 100-5: 1954*, 38.

[231] U.S. Army Command and General Staff College, *Reference Book 31-40*, 1-2.

[232] Joint Staff, *JP 3-13.4*, IV-1to IV-2.

target needs to be reassessed. For example, the target of the deception may not have to authority to order the desired action; in this case, the target should be shifted to the individual with the appropriate authority.

b. THINK

The next step of planning the deception story is THINK. During this step, the deception practitioner must determine what perception the target needs to develop in order to cause the desired action. THINK encompasses the orient and decide phases of the OODA decision-making process. A firm understanding of the target's existing perceptions, organizational decision-making processes, and schemata is vital to the success of this phase of planning, as each of these influence the target's decision-making process (Figure 7, Chapter IV). Continuing the previous example, if the Republican Guard commander is a coward then he may need to think U.S. forces do not intend to attack Kuwait City; whereas, if he is not a coward, then he may need to think U.S. forces intend to attack Kuwait City.

c. SEE

The final step in the SEE—THINK—DO methodology is SEE. During this step, the practitioner determines what indicators the target needs to receive in order to develop the desired perception. SEE is the observe phase of the OODA decision-making process. The deception practitioner must know what channels are available for the target to collect indicators. The available channels serve as a limit on the range of deception techniques used to create the desired indicators—it is a waste of resources to craft an indicator the target cannot see. Finishing the previous example, after assessing that the Republican Guard commander is not a coward, it is determined that the channels available are best suited for demonstrations of amphibious training, simulations and portrayals of force build up along the border of Kuwait, and disinformation activities. Paralleling the development of what the target needs to see is the determination of what the target cannot be allowed to see. The indicators which might reveal the actual operation become the focus for covering deceptions to either obscure these indicators via camouflaging actions or by denying the channels capable of conveying the real

Page 796 of 3957

indicators. The set of desired indicators are then woven together to create the deception story. The deception story is the: "scenario that outlines the friendly actions that will be portrayed to cause the deception target to adopt the desired perception."[233]

4. Deception Means

From the list of desired indicators developed during the SEE phase, a series of deception events is developed. Deception events are "deception means executed at a specific time and location in support of a deception operation."[234] The desired indicators are generated by the execution of the deception events. Deception means are the "methods, resources, and techniques that can be used to convey information to the deception target."[235] The number of deception means is effectively limitless and is only constrained by the imagination and resources of the practitioner. Deception means are subdivided into three broad categories: physical, cyber electromagnetic, and administration.

a. Physical

Physical means are those which activate the senses, principally the senses of hearing, vision, and smell. A static display of decoy tanks is an example of a physical deception means, as are smoke screens. Physical deception means include morphological deceptions that alter the physical characteristics of an object; such as, camouflage paint schemes or the frames used to disguise tanks as trucks during World War II.[236]

Physical means also utilize actions and behavior to convey or hide information from the target.[237] Demonstrations and feints are common forms of actions as physical means. Behavior can be used to create the perception of a pattern in order to condition the target to expect this pattern to continue; for example establishing a routine

[237] Gerwehr and Glenn, *Unweaving the Web*, 39-40

supply convoy for the purposes of setting an ambush. Alternatively, behavior can be used to prevent the target from perceiving a pattern, such as using night movements to conceal a build up of forces before an assault.

Physical means also include sonic deceptions, as in artillery simulators and loudspeaker systems. It is important to note that not all sonic deceptions need to employ mimicry. One method of sonic deception employed by the 4th Infantry Division in Vietnam was the use of artillery fires to mask the sounds associated with infantry units occupying night positions.[238] Prior to the use of the fires, infantry units risked compromising their location due to the sounds associated with preparing and fortifying the positions. In an urban environment, or other environments not permissive to artillery fires, the sounds of operations on the ground could be masked using helicopter flights or loudspeaker operations in the areas surrounding the activity.

b. Cyber Electromagnetic

Cyber electromagnetic means utilize cyberspace and the electromagnetic spectrum [other than visual] in order to communicate deceptive indicators.[239] Deception activities within cyberspace include the transmission of notional documents as disinformation, portrayals in the form of honeypot systems to bait targets into the cyberspace equivalent of ambushes, and the use of camouflaging programs such as an onion router or proxy server to provide cover for cyberspace activities. Furthermore, overt hacking can be used as a feint in order to distract a systems administrator from other cyber warfare activities.

Deceptions within the electromagnetic spectrum are categorized into three types: manipulative, simulative, and imitative. Manipulative electromagnetic deceptions eliminate existing or convey misleading indicators, as in transmitting misleading information on a network known to be compromised. Simulative electromagnetic

[239] Cyber electromagnetic means replaces the traditional category of technical means in order to include capabilities that did not exist when the technical means category was created.

Page 798 of 3957

deceptions replicate existing or create notional capabilities, such as using radio operators to create the emissions of a notional unit. Imitative electromagnetic deceptions introduce emissions into the target's own systems; for example, transmitting false GPS coordinates to the target's navigation system.[240]

Targets who make use of electronically disseminated policies and orders offer a rich resource for exploitation. These documents reveal a perfect template of what right looks like, and if they include copies of official signatures provide a valuable source of added credibility. Electronically disseminated notional documents can be used to increase friction within the target organization by forcing verification of every electronically disseminated documents, or by forcing the target organization to drop this method of information distribution altogether.

c. Administrative

Administrative means include organizational methods to convey misleading or hide real indicators. Examples of administrative means include operations security and information security to deny indicators; as well as, Human Intelligence officers' use of agents as channels in support of a ruse. Administrative means also include the creation of misleading documents; such as, doctored photographs, notional orders, or fake identification.

One method for developing notional documents is to use existing documents as the base. This expedites the work, and helps to ensure that the notional document looks like a real document. The exemplar for use of existing documents is the German use of decade-old dossiers on Soviet officers as the basis for deceptive dossiers implicating these officers in anti-Stalin activities.[241]

Page 799 of 3957

5. Execution and Assessment

a. Execution

The deception events needed to generate the desired indicators are incorporated into a time-phased execution matrix in order to create and maintain the desired perception (Table 6). The deception execution matrix should be constructed and centrally controlled by the command exercising control of the overall plan. Additionally, the deception execution matrix must be nested within the overall mission's execution matrix; however, the deception execution matrix must be kept separate to ensure security.

Task #	Date-Time	Objective	Action	Unit	Termination	Remarks
1	Not later than 0001 5 Jan 1991	Demonstrate preparations for amphibious operations	Conduct amphibious assault training event	2nd Marine Expeditionary Force	Not earlier than 28 February 1991	Coordinate for press coverage of training
2	Not later than 0001 5 Jan 1991	Iraqi forces focus defensive preparations against attack from Southeast	Conduct training operations against replicas of Iraqi fortifications	1st Cavalry Division 2nd Armored Division 2nd Marine Expeditionary Force	Not earlier than 28 February 1991	Coordinate for press coverage of training
3	Not earlier than 0001 17 Jan 1991	Cover movement of XVIII Corps in preparation for 'Hail Mary'	Camouflage movement of XVIII Corps elements through radio silence	XVIII Corps	On order	
3	Not earlier than 0001 17 Jan 1991	Cover movement of XVIII Corps in preparation for 'Hail Mary'	Conduct radio traffic mimicking XVIII Corps elements in assembly area	XX Signal Battalion	On order	
4	Not earlier than 0001 13 Feb 1991	Iraqi forces remain in defensive positions	Conduct feints and probing attacks against Iraqi lines in tri-border area	1st Cavalry Division VII Corps Artillery	On order	
5	Not earlier than H-3	Draw Iraqi attention to Kuwaiti coast	Conduct simulation of amphibious operations	Seal Team Mimke	Not later than H+1	

Table 6. Notional Execution Matrix Based on Events of Operation DESERT STORM[242]

Emphasis on attention to detail during execution is critical to crafting a believable story. In an after action review of Operation ELEPHANT during World War II, a member of the 23rd Headquarters Special Troops lambasted the "bad theatre" of the operation. The mission was to portray the 2nd Armor Division so that the actual division

[242] Daniel Breitenbach, "Operation Desert Deception: Operational Deception in the Ground Campaign," (Paper, Naval War College, 1991), accessed 24 May 2012, http://handle.dtic.mil/100.2/ADA253245. The date-time information in the table is notional for the purposes of presenting a complete matrix.

Page 800 of 3957

could move to the front lines unmolested. Personnel were instructed to inflate the decoy tanks and then go to sleep with no thought of portraying the activities normally seen in a tank unit. Also, the personnel of the 23rd did not wear the patches of the 2nd Armor Division units, nor were the decoys painted with the appropriate bumper numbers. These shortcomings, taken with the blatant disregard of the 2nd Armor Division for operations security during its move, resulted in a very weak ruse.[243] It is paramount that attention to details be observed during deception operations, as a weak deception execution can result in the target recognizing the deception and exploiting it in turn.

b. Assessment

One problem with accessing deception effectiveness is that some assessments would have to rely on counterfactual information. A comment from *Secret Soldiers* sums up this dilemma: "How many American and British fighting men didn't die because, instead of striking the Allied line at a vulnerable point, the Germans discovered a regiment of dummy tanks concealed—but not too well—in the Normandy woods and pulled back instead? How many Old Hickories survived the push across the Rhine because the Germans were preparing to meet the attack thirty miles away, where the Special Troops were sending up their racket on heaters [loud speakers] and radios and massing their decoys with the help of stagecraft and impersonation?"[244]

This is not to say measures of effectiveness are not necessary; rather, measures of effectiveness should be tied to observable indicators that will reveal whether the target is acting on the deception. For example, in the case of a feint, a measure of effectiveness might be the target moving his reserves to support his lines at the point of the feint. In the case of deception for subversion, a measure of effectiveness might be reports of red-on-red violence, defections, or an increase in absenteeism with in the targeted organization. Measures of effectiveness are turned into intelligence requirements for collection.

---

[243] Gerard, *Secret Soldiers*, 153 – 156.

[244] Gerard, *Secret Soldiers*, 334.

Collecting for deception requires a witting actor on the unit's intelligence staff. This actor serves several functions. First, the individual helps to ensure any information requirements for the deception plan are included in the unit's overall collection plan. Second, as information comes into the intelligence section for processing, the witting actor looks for indicators that show the target is accepting or rejecting the deception. Care must be exercised when looking for indicators that the deception is working as this can activate the confirmation bias, causing indicators to the negative to be overlooked and ambiguous indicators to be interpreted as positive. Finally, the actor must work to ensure the deception indicators do not corrupt the friendly force's understanding of the situation.

6. Termination

At some point a deception operation will lose its utility; therefore, deception operations need to have a plan for the termination of the deception. JP 3-13.4 provides a list of possible termination triggers (Table 7). The termination plan should detail the steps taken to dismantle the deception, e.g., the release of units from a feint or demonstration and cessation of portrayal radio traffic. It is important to note that the termination plan should not be set in stone; as the mission progresses, there may be unforeseen opportunities to leverage the deceptions past the original objective. For example, Operation FORTITUDE SOUTH remained effective past D-Day with the First U.S. Army Group being "transferred" to France in order to maintain pressure on German forces; the last parts of FORTITUDE SOUTH were not terminated until early September 1944.[245]

[245] Roger Hesketh, *Fortitude: The D-Day Deception Campaign*, (Woodstock and New York, NY: The Overlook Press, 2000), 289 – 302.

Page 802 of 3957

Trigger	Description
Successful deception operation	The deception objective has been achieved its objectives, or run its course
Change in mission	The mission which the deception supports changes to a degree the deception no longer has utility
Recalculated risk or probability of success	Some element of the deception estimate changes such that the risks or costs to friendly forces are no longer acceptable
Poor timing	Deception is proceeding too slowly, or the window of opportunity has closed
New opportunity	Circumstances change where deception may be less risky or more effective if deception efforts are realigned
Deception compromise	There is cause to believe the target is aware of at least some aspects of the deception plan

Table 7. Potential Termination Triggers[246]

B. PRINCIPLES OF DECEPTION

In addition to the detailed planning processes, a number of authors have published sets of deception principles, factors, and maxims. *FM 100-5* (1954) and *FM 3-13* each present their own doctrinal set of principles. The CIA's maxims from *Deception Maxims: Fact and Folklore* are included in slightly altered form in *FM 90-2* (1988) and *JP 3-13.4* (2006). Michael Dewar, Jon Latimer, and Jock Haswell each offer their own take on deception principles; though there is a good deal of overlap. Finally, Daniel and Herbig provide a set of deception success factors; while Dudley Clarke muses on deception reflections. From these various sets of deception guidance, it is possible to synthesize seven broad principles for deception practitioners[247] (Table 8).

[246] Joint Staff, *JP 3-13.4*, IV-13.

[247] Daniel and Herbig acknowledge the strategic initiative factor is more of an observation than a controllable factor for the deception practitioner; therefore, this factor is not included as a principle in the composite list. Daniel and Herbig, "Propositions on Military Deception," 24 – 25.

1. Know the Target and Exploit Existing Perceptions

a. Understand the Target

Knowing the target is essential to successful deception as every target is unique. British deception efforts in the Pacific during World War II had to be significantly modified from the model of deception operations in North Africa and Europe; the Japanese commanders did not trust their intelligence staff like the German commanders did.[249] Every reasonable effort should be taken to develop an understanding of the target's personal, organizational, and cultural schemata; as well as, to identify any existing perceptions.

b. Exploit Existing Perceptions

Deception can be used to both reinforce the target's existing perceptions and to change the perceptions. Whenever possible, deceptions should seek to leverage existing perceptions as is the far easier of the two endeavors. The anchoring bias discussed in Chapter IV works against changing perception, as do several other cognitive biases. The idea of using the target's existing perceptions and beliefs is a common admonishment in deception writings, as shown in Table 8. The Magruder Principle from the set of deception maxims compiled by in the CIA's *Deception Maxims: Fact and Folklore* states: "It is generally easier to induce an opponent to maintain a preexisting belief than to present notional evidence to change that belief. Thus, it may be more fruitful to examine how an opponent's existing beliefs can be turned to advantage than to attempt to alter these views."[250] Reinforcing existing perceptions also leverages confirmation bias as discussed in Chapter IV. Operation FORTITUDE SOUTH during World War II is an exemplar of using deception to reinforce the target's existing perceptions. In this case, the German command expected the inevitable invasion of Europe would come at the Pas de Calais.

This principle is not a hard and fast rule; operational necessity may require changing the target's existing perceptions, as was the case with General Pershing and the

[249] Clarke, "Some Personal Reflections," 273 – 274.

[250] Deception Research Program, *Deception Maxims: Fact and Folklore*, 5.

reduction of the St. Mihiel salient during World War I. German forces expected General Pershing to attack where he intended to attack. General Pershing used a convincing demonstration supported by several pieces of disinformation to convince the Germans the attack would come elsewhere. As a result, the German's shifted forces away from the point of decision, facilitating General Pershing's success.[251]

c. Avoiding Windfalls

While the deception practitioner wants the target to receive the deception indicators, care must be taken that the deception indicators are not too easily presented to the target. Given how difficult intelligence collection can be, there is a natural tendency to be suspicious of information too freely gained. *FM 3-13* offers two methods to reduce target suspicion of windfalls. "The first is the unintentional mistake, designed to make the target believe that he obtained the indicator due to a friendly error or oversight."[252] An example of an unintentional mistake ruse occurred during deception operations in support of the American Expeditionary Force's assault on the Saint Mihiel salient during World War I; General Pershing's chief of staff left a crumpled sheet of carbon paper with the imprint of a disinformation laden memo in the wastebasket of his hotel room, knowing the German agents on the hotel staff would find the carbon paper.[253]

The second method of reducing suspicion of deception indicators is bad luck, which is designed to make the target believe the information was obtained "because the source fell victim to uncontrollable circumstances."[254] Though now considered apocryphal, Meinertzhagen's haversack ruse is still a good example of how this method can be employed.[255] In order to deceive Turkish forces of British intent to capture Beershaba, Meinertzhagen developed a notional set of documents indicating the focus of

---

[251] See Chapter VI for a detailed account of the deception in support of the St. Mihiel operation.

[252] Headquarters, Department of the Army, *FM 3-13*, 4-10.

[253] The Editors of the Army Times, *The Tangled Web*, 71.

[254] Headquarters, Department of the Army, *FM 3-13*, 4-10.

[255] Meinertzhagen has been accused of fraudulently taking credit for both the idea and execution of the haversack ruse. See: Brian Garfield, *The Meinertzhagen Mystery: The Life and Legend of a Colossal Fraud*

British efforts was the capture of Gaza, not Beershaba. Next, Meinertzhagen rode toward Turkish lines until he made contact with a Turkish patrol. Once the Turkish patrol began pursuit, Meinertzhagen fled, and in his haste lost his haversack containing the notional documents. Meinertzhagen took pains to increase the legitimacy of the lost haversack. First, Meinertzhagen spattered his haversack with blood so it appeared he had been wounded during the encounter. Second, in the days after the encounter, numerous British patrols were observed scouring the site of the encounter as if searching for the missing haversack.[256]

2. Security is Paramount

Maintenance of security is vital to a successful deception operation. Failure to properly secure the deception plan can result in leaked indicators that tip the hand to the target. If this occurs, there is a significant risk that the target will in turn deceive the practitioner, turning the tables. Hesketh states in the conclusion of his work that one of the cases against physical deception is the necessity to let too many people in on the secret, increasing security risks.[257] Similarly, von Greiffenberg admonishes: "If the strictest secrecy is not observed all deception projects—even the smallest—are doomed to failure from the very start."[258]

However, security must be balanced with the need for coordination, as too much security can undermine the coordination necessary for the deception to succeed. This is exemplified by British raid at Saint-Nazaire. The British Air Force was tasked with conducting a bombing mission on Saint-Nazaire as a feint to distract the German forces from the raiding force; however, the bomber crews were not told of the reason for their mission, so when low clouds obscured the target, the mission was called off with minimal bombing conducted. The short bombing mission put German forces on alert, rather than

the intended effect of providing cover for the raid force. In the after action review, the bombing crews were adamant that had they known the true purpose of the bombing mission, they would have not have cut the mission short.[259]

3. Utilize Flexibility, Variety, and Conditioning

a. Flexibility

Deceptions must be flexible and the practitioner ready to revise and adapt the plan based on feedback from the target. For example, Operation FORTITUDE SOUTH was expected to be terminated shortly after the Normandy landings as the landings would betray the Allies true intentions. However, in order to keep the German Fifteenth Army from assaulting the Normandy beachhead from its position in the Pas de Calais region, the Allies decided to adapt and continue OPERATION FORTITUDE SOUTH's fiction that the Allies still had the capability to attack Pas de Calais. The modified deception plan became Operation FORTITUDE SOUTH II, and succeeded in keeping the Fifteenth Army in place.[260]

b. Variety

Deceptions should employ variety, both in terms of indicators and channels in order to increase the likelihood of the deception story reaching the target. Reliance on a limited indicators or channels risks the indicator not being received by the target. This can occur either due to noise disrupting the indictor, or if the target is not monitoring the channel when the indicator is transmitted. The number of indicators and channels needed is dependent on the practitioner's knowledge of the target. While it is possible for a single indicator and channel to be used if the practitioner has direct access to the target; such as, General Nathan Bedford Forrest's' portrayal of additional troops during a parley with a Union stronghold's commander. However, in general practice, there should be multiple indicators and channels. For example, in support of Operation

[259] McRaven, *Spec Ops*, 131 and 154.

[260] Hesketh, *Fortitude*, 241.

FORTITUDE SOUTH, the Allies used a number of indicators and channels to include: several agents of the DOUBLE CROSS system, decoys and dummies to simulate units, radio teams to portray units, and disinformation.

c. Conditioning

Conditioning, also referred to in literature as "crying wolf," is a deception technique that relies on desensitizing the target to friendly actions. Conditioning seeks to create three misconceptions in the target's mind. First, friendly activities are following a routine. Second, the routine is set, with deviation unlikely. Third, because the friendly activities are following a set routine, the risk to the target is reduced.[261] The quintessential example of conditioning is the Egyptian preparations leading up to the 1973 Yom Kippur War. The Egyptian Army undertook a series of training exercises on its side of the Suez Canal, establishing a pattern of behavior. The staging of forces for the war followed the pattern of the training exercises, lulling Israeli intelligence into a false sense of understanding.

Stonewall Jackson provides an additional exemplar for conditioning the target. Early in the Civil War, the Baltimore and Ohio Railroad had been allowed to maintain its East-West line between Washington and the West, despite a portion of the line crossing through Virginia. Jackson, while serving as commander at Harper's Ferry, complained that the trains disrupted his men's sleep and requested all east bound trains run between 11pm and 1am. The railroad company complied in an effort to maintain good will. After a while, Jackson requested all west bound trains run at the same time as the east bound trains; again the railroad complied. Once the schedule was up and running, Jackson used his detachments at Point of Rocks and Martinsburg to trap all the rolling stock between them. The trains were then diverted to the south for use by the Confederacy.[262]

[262] G. F. R. Henderson, and Garnet Wolseley, *Stonewall Jackson and the American Civil War* (London, New York [etc.]: Longmans, Green and Co., 1936), 1:121 – 122.

4. Coordination and Control

a. Control

Control of deception planning and execution should reside at the lowest echelon capable of executing the plan. For example, an infantry platoon conducting the camouflage aspects of cover should maintain control of the plan at the platoon level. Control of deception plans requiring external support, e.g., airborne jamming, should be controlled at the level capable of coordinating for the support. This allows for von Greiffenberg's guidance that: "One responsible agency issues the order, assigns what equipment may be necessary, and supervises the course of the operation as a whole."[263] At the same time, the commander overseeing the deception operation must "make one individual responsible for overseeing a [deception] operation."[264] Having too many people "in charge" results in no one being in charge.

b. Coordination

Coordination for a deception plan must be made with adjacent units and higher headquarters so that deceptive indictors do not contaminate the other units' intelligence collection efforts. Additionally, coordination helps to ensure the deception plan nests with and compliments higher and adjacent unit plans, and does not conflict or degrade these plans. An example of poor coordinate occurred during the assault on the German garrison at Brest during the summer of 1944; the 23rd Headquarters Special Troops executed a sonic simulation of tank activity to distract the Germans from the main effort. Through a lapse of coordination, Company D, 709th Tank Battalion assaulted through the area the 23rd had been conducting its simulation; as a result, the German line, alert and reinforced thanks to the deception, decimated the company.[265]

[264] Headquarters, Department of the Army, *FM 3-13*, 4-16.

[265] Gerard, *Secret Soldiers*, 183 – 184.

5. Requirement for Target Action

For deception to succeed, the target must execute the desired action or inaction; to merely change the target's perception is to waste time and resources. This requirement demands the deception practitioner never lose sight of the deception goal. As Dudley Clarke declares:

> It is important to appreciate from the start that the only purpose of Deception is to make one's opponent ACT in a manner calculated to assist one's own plans and to prejudice the success of his. In other words, to make him *do* something. Too often in the past we have set out to make him THINK something, without realizing that this was no more than a means to an end. Fundamentally it does not matter in the least what the enemy thinks; it is only what line of action he adopts as a consequence of his line of thought that will affect the battle. As a result we resolved the principle that a commander should tell his Deception staff what he wants the enemy to DO… while it is the duty of the latter to decide, in consultation with the Intelligence Staff, what he should be made to THINK in order to induce him to adopt the required course of action.[266]

6. Preparation and Timing

As German General Hans von Greiffenberg states in his survey of German deception during World War II: "Deception requires detailed preparation, in which details and seeming trifles cannot be overlooked. Only seldom will results be produced through improvisation."[267]

Adequate resources must be balanced with economy of force. Economy of force dictates that the minimum resources necessary to secondary tasks in order to maximize forces available for the main effort. Too many resources diverted to secondary efforts may leave insufficient forces for the main effort; conversely, too few resources allocated in support of deception can lead to failure. For example, one of the reasons for the failure of Operation COCKADE was insufficient forces in support of the deception. Operation COCKADE was an Allied deception designed to conceal the weakness of Allied Forces in Britain, and to discourage Germany from transferring forces out of Western Europe to the

[266] Dudley Clarke as quoted in Michael Howard, *British Intelligence in the Second World War: Strategic Deception*, vol. 5 (New York: Cambridge University Press, 1990), 41.

[267] Von Greiffenberg, *Deception and Cover Plans*, 80.

Eastern Front.[268] The plan required significant resources for execution, but the supporting commands successfully resisted tasking efforts, resulting in an ultimately unconvincing deception.[269]

With regards to timing, two adversaries arrive at the same conclusion. Von Greiffenberg states: "The enemy intelligence must be given opportunities to develop the picture which has been arranged."[270] While on the Allied side, Clarke states: "Every Deception Plan must be given time to work. It is no good telling a Deception Staff to try and influence an enemy 'at once.'"[271]

7. Beware Unintended Consequences

As with any operation, a deception can cause unintended consequences. These consequences can vary from insignificant to potentially catastrophic. "Under certain circumstances deceptions can produce effects exactly opposite to the planned objective. It is therefore advisable to reflect how such a reversal can be detected in time."[272] The famous example of a reversal was Dudley Clarke's deception of the Italian force in Abyssinia; rather than reinforcing the southern flank as intended, the Italian force withdrew to the north, directly into the intended path of the actual attack.[273]

Operation Desert Storm experienced unintended consequences of the deception operations as a result of the deception being perhaps too successful. The threat of an amphibious assault caused the Iraqi forces to pull their defenses forty kilometers north of the southern Kuwaiti border in an attempt to prevent any amphibious assault from flanking the lines. The lack of resistance in southeastern Kuwait allowed coalition forces operating in this area to rapidly outpace other elements in the attack. This caused the synchronization of coalition efforts to be disrupted; some initiative was sacrificed as units

[273] Clarke, "Some Personal Reflections," 273.

were held back in an effort to regain synchronization. Additionally, the amphibious demonstrations sparked the withdrawal of Iraqi forces more quickly than expected, complicating the destruction of several key Iraqi elements.[274]

C. DECEPTION IN SUPPORT OF IRREGULAR OPERATIONS

History is replete with examples of deception in support of conventional operations; deception can support irregular operations as well. Irregular operations include unconventional warfare, counterinsurgency and foreign internal defense, stability and humanitarian assistance, counterterrorism, and cyber warfare.[275] While theoretically any deception technique can be used in support of any type of operation, certain deception techniques lend themselves to the nature of the various types of irregular operations.

1. Unconventional Warfare

A critical concern for unconventional warfare operations is security, especially during the nascent phases of the campaign when the state holds a distinct force advantage over the movement. Deception is a vital tool for maintaining the security of both the forces working with the guerrilla force and for the guerrilla force as well. Otto Heilbrunn in his work *Partisan Warfare* quotes extensively from an unnamed Vietminh manual on the utility of deception in support of guerrilla operations:

> We must act above all when the enemy, full of self-confidence, is underestimating us. We then order our men to disguise themselves as coolies, as enemy soldiers, as hawkers on their way to the market place. Our disguised fighters must exploit the element of surprise in order to wipe out the enemy in his fort or garrison. This technique requires constant and detailed information; one must be fully informed about the enemy's situation, from the first preparations to the time of execution.[276]

---

[274] Breitenbach, "Operation Desert Deception," 22 – 24.

[275] While cyber warfare and humanitarian assistance are not normally included in the set of irregular warfare, they are included here since they are not conventional operations.

[276] "Guerilla selon l'ecole communiste," *Bulletin Militaire* (Leopoldville: Etat-Major de la Force Publique, 1955) as quoted in Otto Heilbrunn, *Partisan Warfare* (New York: Frederick A. Praeger, 1962), 95. This is perhaps from Vo Nguyen Giap's *People's War, People's Army*.

Page 813 of 3957

The camouflaging aspects of deception would seem to be of particular importance to an unconventional warfare campaign in order to allow the special operations force and the guerrilla force to move amongst the population like Mao's fish.

The adoption of Afghan sartorial and grooming standards by special operations forces elements during the opening phase of Operation ENDURING FREEDOM served two purposes. First, the standards were adopted for the purposes of bridging the cultural divide between the SOF elements and the Northern Alliance forces, reducing the "out-groupness" of the SOF elements and leveraging the influence principle of liking. Second, the sartorial and grooming standards increased security for the SOF elements by serving as a form of blending cover, decreasing the visual signature of the SOF elements by merging them visually with the Northern Alliance forces.

FM 31-21: Guerrilla Warfare and Special Forces Operations suggests another method of deception in support of security:

> False rumors and false information concerning guerilla strength, location, operations, training, and equipment can be disseminated by counterintelligence through clandestine nets. Facts may be distorted intentionally to minimize or exaggerate guerilla' capabilities at any given time. Although such activities are handled within the intelligence section, they must be coordinated with the security section in order to prevent inadvertent violations of security.[277]

In this method, deception can cause the targeted regime to expend resources chasing ghosts, such as MACVSOG creating the perception there were far more agents operating within North Vietnam than actually present.

Finally, deception in support of subversion can be used to introduce friction to the regime's decision-making process through the use of ambiguity increasing measures. Slowing down the adversary's OODA process is as effective as increasing the speed of

[277] Headquarters, Department of the Army, *FM 31-21: Guerrilla Warfare and Special Forces Operations* (Washington, DC: Department of the Army, 1958), 106.

one's own. Sufficient ambiguity increasing active deceptions coupled strong cover deceptions increase friction to the point of inducing mental isolation, with the regime's leadership unable to act.[278]

2. Counterinsurgency/Foreign Internal Defense

Pseudo-operations like those employed by the British in Kenya during the Mau-Mau uprising may be of use in overcoming the information advantage enjoyed by the insurgency through intelligence gathering.[279] For example, a pseudo-operation might be designed to lure in supporters and potential supporters of the targeted group for the purposes of intelligence collection and nuanced influence activities. Care must be exercised with pseudo-operations as they thread a fine line with perfidy, international law stipulates that while combatants may wear enemy uniforms may be worn, combatants are prohibited from fighting in them.[280] The Selous Scouts of Rhodesia crossed the line into perfidy by attacking an insurgent base camp while portraying Mozambique military forces.[281]

In addition to pseudo-operations, other deceptions may work to illuminate the insurgency. For example, disinformation in the form of forged orders inserted into an insurgent network can be used to fix cells of the network in time and space for targeting by directing the cell to attend a meeting. The effectiveness of this approach depends on the nature of the insurgent group; a strict hierarchal structure will be more susceptible than a loose-knit structure. Likewise, disinformation about friendly collection capabilities can be used to canalize network communications onto less secure or fewer channels, facilitating collection efforts, or to protect existing collection capabilities. For example, during World War II, ULTRA was protected at times by attributing the intelligence collected to other means.

Page 815 of 3957

Deception for the purpose of subversion could be used to sow discord amongst the insurgent network. This tactic could be particularly disruptive if the practitioner has a firm understanding of the network and is able to target the individuals serving as links between cells. The British used deception in support of subversion against the Irish Republican Army by creating the perception the IRA was riddled with British agents. The IRA acted on the perception by conducting an internal witch hunt. The resultant purge of misidentified "agents" greatly weakened the organization and allowed the British to reach favorable terms for a ceasefire.[282] Additionally, since there is an inverse ratio between security and efficiency, deception for subversion can be used to cause the target to increase security measures to the point of operational ineffectiveness.[283] Finally, as discussed in the unconventional warfare section, deception in support of subversion and mental isolation can be used to introduce friction in the OODA decision-making process, potentially negating an inherent advantage of networks.

One note of caution, as tempting as the idea might seem, false flag attacks on the populace for the purposes of discrediting the insurgent group are a fundamentally bad idea. The effects on popular support for the host nation government and the U.S. mission would be catastrophic if the true nature of the operation were revealed.

3. Stability Operations / Humanitarian Assistance Operations

Deception operations in support of stability operations and humanitarian assistance operations are probably most appropriate when in support of force protection or operations security. For example, in areas where banditry is a problem, a demonstration convoy might be useful to draw attention away from an actual relief convoy. Blending and disguising aspects of deception may be appropriate if a lower signature is desired. Rules of engagement and political sensitivities may significantly constrain the palette of deception techniques available.

Page 816 of 3957

4. Counterterrorism

Benjamin Higginbotham, in his thesis "On Deceiving Terrorists," presents three compelling methods where deception can be used against terrorists and terrorist organizations:

- Create and exploit inefficiencies and weaknesses in the terrorist organization
- Facilitate counter-terrorist operations
- Conceal counter-terrorist capabilities and intentions[284]

Deception in support of subversion as discussed in the previous section on counterinsurgency is equally applicable against terrorist groups, and could prove quite useful at creating and exploiting internal inefficiencies and weaknesses of terrorist groups. For example, disinformation spread via rumors that there is an informant within the terrorist group could be spread in areas where the terrorist are suspected of operating in order to sow dissension. Alternatively, if previous purges have occurred, a disinformation program that suggests the group leadership is planning another purge could be used to increase distrust of the leadership, and perhaps an internal preemptive strike against the leaders.

Deception can facilitate counter-terrorist operations by creating surprise. In the Israeli raid on Entebbe, deception in the forms of portrayal and masking played a critical role in achieving surprise and retaining initiative. First, the Israeli aircraft masked their approach behind the signature of a regularly scheduled aircraft. Additionally, the Israeli commando force portrayed Ugandan military forces through the use of Ugandan uniforms and a Mercedes disguised to look like a Ugandan staff car. These techniques sowed confusion amongst the terrorists and their Ugandan guards, with the terrorists initially believing the Ugandans had turned on them.[285]

---

[284] Higginbotham, "On Deceiving Terrorists," 25 – 26.

[285] McRaven, *Spec Ops*, 341 – 376.

5. Cyberwarfare

Cyberspace as an emerging arena for military operations presents as many opportunities for deception as the physical world. For example, honeypots can be used to mislead the target for the purpose of intelligence gathering. Disinformation in the form of spoofed emails could be used to prompt any manner of actions by the target. Pseudo-operations in the form of websites portraying adversary websites can be used for disinformation, intelligence gathering, or influence operations. On the defense, ambiguity increasing deception can be used to protect sensitive information—e.g., operations plans, personnel rosters, or technical data—through the use of multiple files where only one is the true information

D. MILITARY DECEPTION FAILURES

Finally, no discussion of the practice of deception is complete without addressing deception failures. Somewhat optimistically, the CIA report, *Deception Failures, Non-Failures, and Why*, states the following with regard to deception failures: "It can accurately be stated that deception nearly always succeeds, at least to some degree. Indeed it should be emphasized that deception may succeed even when one or more … causes for failure is present."[286] Despite this assertion, the report provides eleven reasons why a deception may fail. These reasons were derived from an analysis of Allied and Axis deception failures during World War II:

- Detection by the intended victim
- Incomplete or incorrect understanding of the target's intelligence apparatus
- Incomplete or incorrect modeling of the deception process
- Inadequate or improper channels or vehicles to convey the deception story
- Incomplete or inadequate control over the significant variables of the deception process
- Incorrect assessment of the target's reaction
- Deception story falls outside the deception window, e. g., too sophisticated to be received or too simplistic to be believed

[286] Deception Research Program, *Deception Failures, Non-Failures, and Why*, 45 – 46.

Page 818 of 3957

- Unreasonable expected result
- Target unable to react in the intended manner even if deception considered credible
- Inadequate time for the deception process to run its course
- Bad luck[287]

With the exception of bad luck, each of these failures represents a shortcoming in the planning and/or execution of the deception plan. For example, "detection by the intended victim" can be caused by failure to properly cover the indicators of the true operation, by a poor deception story, or by shoddy execution of the deception tasks. Likewise, "inadequate or improper channels or vehicles to convey the deception story" represents a failure to either assess the channels available the target, or a failure to revise the plan after discovering the channels were insufficient. While no deception plan is perfect, proper adherence to the information requirements and principles laid out in this chapter can reduce the risk of deception failures.

VI. HISTORIC U.S. ARMY USE OF DECEPTION

Always mystify, mislead, and surprise the enemy.

– General Thomas "Stonewall" Jackson[288]

This chapter surveys the use of deception by the U.S. military from the Revolutionary War to Operation DESERT STORM. The purpose of this chapter is twofold; first to present additional examples of deception in action as prompts for the deception practitioner's creative processes, and second to reinforce the idea that deception has been of great utility for the U.S. military throughout its history.

A. REVOLUTIONARY WAR – BATTLE OF TRENTON

January 2, 1777 saw George Washington trapped against the banks of the Delaware River outside Trenton, New Jersey by a superior British force under General Cornwallis. Despite suggestions to attack straight away, Cornwallis was sufficiently satisfied that Washington was trapped and so waited to attack the next day. The British set camp inside Trenton. During the night, the American force built large bonfires of cedar rails along their lines and continued through the night working to reinforce the earthworks. British sentries could see movement and hear the sounds of the digging. Sporadic cannon fire from the American lines kept the British in Trenton jumpy. When Cornwallis and his men arose the next morning to quash the rebellion all they found was an abandoned camp with piles of fresh dirt and smoldering fires.

The fires and work crews served as demonstrations; and the cannon fire as a feint in order to reinforce Cornwallis's perception that Washington was trapped, and to mask the noise of the American army quietly marching away to attack Princeton. Wagon and cannon wheels were wrapped in cloth to deaden the noise of movement over the frozen ground. A group of 500 stayed behind to work the deception. These men pulled out

[288] General Jackson in a letter to Brigadier John Imboden, as quoted by Imboden, as quoted in: Henderson, *Stonewall Jackson*, 1:420.

Page 821 of 3957

before dawn to rejoin the main body.[289] Security of the plan was so tight that "no one below the rank of brigadier was privy to the plan; officers who were quartered in outlying farmhouses awoke the next morning to find the army gone…."[290]

Deception Objective (DO)	British forces do not impede withdrawal
Deception Target	General Cornwallis
Deception Story (THINK)	American Army preparing for morning battle
Deception Events (SEE)	Demonstration – bon fires Demonstration – men building fortifications Feint – cannon fire Securing – tight security on plan Masking – noise of work obscuring noise of movement
Termination Trigger	Main force withdrawal completed

Table 9. Deception Analysis of Battle of Trenton

B. CIVIL WAR

1. Peninsula Campaign

A classic example of an inferior force using deception to transform certain defeat to a tactical stalemate and strategic victory occurred during the Civil War. Major General Magruder was tasked with preventing the largest Union army yet assembled from reaching Richmond. To achieve this objective, Magruder utilized a number of deceptions, including the use of soldiers portraying deserters to feed General McClellan disinformation exaggerating the size and composition of the Confederate force. The "deserters'" information was confirmed by aerial observation which reported on the troop movements, cavalry, and camp fires carefully choreographed by Magruder. When McClellan approached the Confederate breastworks, he was presented with a now famous simulation—Quaker guns. In order to inflate the number of cannon available to the Confederate force, Magruder had tree trunks stripped, bored, and painted so that they simulated cannon to the casual eye. In McClellan's perception, the Confederate force was larger and better equipped than his, and so McClellan delayed his attack for over a month while he assembled the forces he felt necessary for the attack. This delay allowed ample

[289] Richard M. Ketchum, *The Winter Soldiers*, 1st ed. (Garden City, N.Y: Doubleday, 1973), 344 – 351.

[290] Ketchum, *The Winter Soldiers*, 348

time for the Army of Northern Virginia to place itself between McClellan and Richmond. Additionally, the delay subjected McClellan's force to the bad weather and mosquitos of the peninsula, resulting in many soldiers combat ineffective from illness. When McClellan finally attacked in early May, he found the Quaker guns, but not Magruder. Magruder had used the delay to withdraw his force back to the Army of Northern Virginia lines; Richmond was safe.[291]

Deception Objective (DO)	Union forces do not press attack until after arrival of Army of Northern Virginia
Deception Target	General McClellan
Deception Story (THINK)	Confederate force too large to attack without significant Union reinforcements
Deception Events (SEE)	Simulation – Quaker guns Portrayal – cavalry and infantry units replicating additional units Simulation – additional camp fires
Termination Trigger	Army of Northern Virginia in position

Table 10. Deception Analysis of Peninsula Campaign

2. Capture of Atlanta

During the summer of 1864, Major General Sherman attempted for several months to capture Atlanta, Georgia; however, the city was well fortified and Sherman was unsuccessful in compelling the surrender of the Confederate defenders under General John Hood. Unable to crack the nut that was Atlanta via siege, and unwilling to mount a potentially disastrous frontal assault, Sherman resorted to deception and the indirect approach.

The deception used by Sherman was a feigned withdrawal. Prior to 26 August, Sherman ordered his men be provisioned with 20 days rations, the unit trains reduced to what was absolutely necessary, and all sick and wounded evacuated. Additionally, Sherman cut communications with higher headquarters to reduce the chances of a leak or captured courier.[292] As part of the preparatory movements, Sherman had one brigade of dismounted cavalry from the 2nd Cavalry Division occupy the trenches of the 12th and

[291] The Editors of the Army Times, *The Tangled Web*, 4 – 13.

[292] The Editors of the Army Times, *The Tangled Web*, 15 – 17.

4th Corps in order to prevent the defenders from noticing the corps' movements.[293] After midnight on the 26th, in a move reminiscent of Washington at Trenton, Sherman's force began a near silent withdrawal under the cover of darkness. The withdrawal was not discovered by the Confederate defenders until the next morning. Initial caution transitioned into celebration as the defenders viewed the now empty Union positions strewn with cast off materials. The idea that the Union forces had withdrawn was reinforced by reports of Union cavalry to the west scrounging for rations.[294] The Hood telegraphed Richmond reporting his belief that "…the hungry Union army was giving up the siege and withdrawing across the Chattahoochee."[295] Sherman's forces maintained tight security until seizing Jonesborough, south of Atlanta. By 2 September, Atlanta was in Union hands.[296]

Deception Objective (DO)	Confederate forces fail to react to flanking maneuver
Deception Target	General Hood
Deception Story (THINK)	Union forces have retreated in defeat
Deception Events (SEE)	Portrayal – 2nd Cavalry Division posing as 12th and 4th Corps Demonstration - withdrawal Disinformation – cavalry claim to be short on rations Blending – silence during withdrawal and movement Securing – communications silence
Termination Trigger	Seizure of Jonesborough

Table 11. Deception Analysis of Atlanta

3. Athens, Alabama

In 1864, Nathan Bedford Forrest elicited the surrender of a Union stronghold at Athens, Alabama through the artful use of portrayal. After a short siege of the fort, Forrest arranged a parley with the fort's commander, Colonel Wallace Campbell. During the parley, Campbell was provided with a seemingly impromptu tour of the Confederate camp. Unbeknownst to Campbell, as he completed the tour of a campsite, many of the

[293] William Sherman, *Memoirs of General William T. Sherman*, 2nd ed. (New York: D Appleton and Company, 1904), 2:105; Basil Liddell Hart, *Sherman: Soldier, Realist, American* (New York: Dodd, Mead, and Company, 1929), 296.

[294] The Editors of the Army Times, *The Tangled Web*, 17 – 22.

[295] Liddell Hart, *Sherman*, 298.

[296] The Editors of the Army Times, *The Tangled Web*, 21 – 22.

Confederate infantry from first campsites were portrayed by dismounted cavalry. After Campbell passed, the cavalry remounted and moved to other campsites to be counted again. Artillery pieces were similarly shuffled around, so Campbell was presented the image of a Confederate force four times its actual size. Rather than risk his men against this overwhelming force, Campbell surrendered the fort without further bloodshed.[297] Though Forrest could have reduced the fort through traditional means, the deception both saved lives, and afforded Forrest the freedom of maneuver to turn his force on the Union relief column heading for the fort.

Deception Objective (DO)	Union stronghold surrenders
Deception Target	Colonel Campbell
Deception Story (THINK)	Confederate force is overwhelming, so resistance is futile
Deception Events (SEE)	Portrayal – troops replicating additional forces
Termination Trigger	Surrender by Colonel Campbell

Table 12. Deception Analysis of Athens, Georgia

C. PHILIPPINE INSURRECTION – RAID ON PALANAN

By February 1901, the United States had lost over four thousand Soldiers in two years of combatting insurrection on the Philippines island of Luzon, with no end in sight. The leader of the insurrection was Emilio Aguinaldo. Aguinaldo fought a classic guerrilla campaign, with his troops seemingly everywhere but himself nowhere to be found. On 8 February 1901, a U.S. Army brigade commanded by Colonel Frederick Funston captured one of Aguinaldo's couriers with a message from Aguinaldo which "…ordered insurgent General Lacuna to send 200 soldiers from his brigade to Aguinaldo's headquarters."[298] The courier revealed that the headquarters was located six miles inland at Palanan, in an isolated region of Luzon. As important as the location was the information that there were only 50 rebel troops guarding Aguinaldo.[299] While Funston wanted to act on the

[298] Barton Whaley, "The One Percent Solution," in *Information Strategy: A Guide to Theory and Practice*, edited by John Arquilla and Douglas Borer, 127 – 159 (New York and London: Routledge, 2007), 151.

[299] Frederick Funston, *Memories of Two Wars* (London: Constable & Co., Limited, 1912) 384 – 389.

information, he knew there was no way for a large American force to reach Aguinaldo's lair without providing enough forewarning to give Aguinaldo opportunity to escape. Funston, not willing to let the opportunity to strike a hard blow to the insurrection, turned to deception.[300] Funston in his memoir states:

> So the only recourse was to work a stratagem, that is, to get to [Aguinaldo] under false colors. It would be so impossible to disguise our own troops that they were not even considered, and dependence would have to be placed on the Macabebes… As it would be absolutely essential to have along some American officers to direct matters and deal with such emergencies as might arise, they were to accompany the expedition as supposed prisoners who had been captured on the march, and were not to throw off that disguise until there was no longer necessity for concealment.[301]

With approval from General MacArthur, Funston ordered 85 Macabebe troops to be outfitted with the weapons and uniforms of the insurgents. Funston and the four American Soldiers accompanying him were dressed as privates and pretended to be prisoners of the disguised Macabebe force. In addition to the disguises, Funston carried several pieces of Lacuna's personal stationary with his forged signature. These would be used to send messages from the insurgent leader to Aguinaldo legitimizing the arrival of the "reinforcements."[302] After a month's training for the Macabebe force, Funston's group set off for Palanan. The pseudo-operation worked exquisitely; when the force arrived in Palanan on March 26th, Aguinaldo was captured with only five casualties—all rebels.[303] The forged letters played an essential role in the ruse with Aguinaldo admitting the letters were key to his letting his guard down and allowing the band into his camp.[304] Shortly after Aguinaldo's capture, he ordered the end of the insurrection. Of the operation, Aguinaldo opined: "It was a bold plan, executed with skill and cleverness, in the face of difficulties which to most men would have seemed insurmountable."[305]

It's interesting to note that while Funston's deception was a tactical and strategic victory, breaking the back of the insurgency; Funston was pilloried in American press, and even on the Senate floor for committing a war crime. Indeed, but current international law, Funston would be accused of perfidy for allowing the Macabebes to attack while wearing the enemy's uniforms.[306]

Deception Objective (DO)	Allow entry of Funston's force into Aguinaldo's camp
Deception Target	Aguinaldo and rebel forces enroute to camp
Deception Story (THINK)	Funston's force is the requested reinforcements with prisoners
Deception Events (SEE)	Portrayal – Macabebe troops dressed as rebel troops Portrayal – Funston and other Americans as captured privates Disinformation – forged messages
Termination Trigger	On order after arrival into camp

Table 13. Deception Analysis of Raid on Palanan

D. WORLD WAR I – SAINT MIHIEL

While a deception practitioner should seek to leverage existing target perceptions, there are times when this is impossible. For example, when the true objective is already perceived by the adversary to be the objective, reinforcing this perception would be—to say the least—counterproductive. In these cases, deception can be used to change the target's perception. General Pershing's use of deception in support of the assault on the Saint Mihiel salient during World War I demonstrates a successful execution of this scenario.

Pershing saw the reduction of the salient as a necessary step to winning the war; however, the German High Command fully expected an attack by American forces at Saint Mihiel. To increase the prospects of success, Pershing undertook a deception to make the German High Command believe the true focus of the American attack would be the Belfort Gap, 125 miles southeast of Saint Mihiel, with the deception goal of the German High Command shifting resources from Saint Mihiel. On 25 August, 1917, a French liaison officer informed the American press corps—off the record—that the American objective might be further to the South, perhaps the German town of Mulhouse that located on the other side of the Belfort Gap. Not surprisingly, this leak made it by military censors. On 27

[306] The reaction in the U.S. to Funston's operation is discussed in detail in Chapter 3.

August 1917, General Pershing sent Major General Bundy, Commander VI Corps, to the town of Belfort on secret orders to plan for an offensive through the gap. Major General Bundy was an unwitting actor and took to his mission with alacrity. Soon American reconnaissance parties were seen around Belfort marking out locations for supply depots, field hospitals, and artillery positions. To create the impression of troop movements, radio sets from the 91st Infantry Division were used to mimic the transmissions of the VI Corps. The military preparations were reinforced with civil-military operations as pained efforts were made to ensure the local populace had evacuation plans. The crowning piece of disinformation supporting the deception was a piece of carbon paper discarded by Colonel Conger, Pershing's witting actor on the scene, in the waste basket of his hotel room in Belfort. Conger had used to carbon paper for a letter to the American Expeditionary Force Headquarters detailing the Belfort preparations as only needing an execution date. After depositing the carbon in the trash, Conger took a walk, and the German spies on the hotel staff did their part stealing the carbon.

In response to the deception, German High Command moved three divisions from Saint Mihiel to reinforce the Belfort Gap. With German perceptions changed and behavior suitably modified, Pershing's 12 September attack against the Saint Mihiel salient was a success. After the war, Colonel Conger received confirmation from the German commander at Belfort that when he requested the additional divisions he understood the buildup might be a ruse, but could not risk it being real. A deception using a minimum of resources was able to alter the perception of the German High Command in 19 days.[307]

Deception Objective (DO)	German High Command shifts forces from Saint Mihiel
Deception Target	German High Command
Deception Story (THINK)	American Expeditionary Force plans on attacking through the Belfort Gap
Deception Events (SEE)	Demonstration – Major General Bundy Demonstration – reconnaissance parties Disinformation – leak to press Disinformation – Colonel Conger memorandum Portrayal – 91st Division creating radio traffic of VI Corps
Termination Trigger	Execution of attack on Saint Mihiel

Page 828 of 3957

E. DECEPTION IN WORLD WAR II

1. Operation FORTITUDE SOUTH

With an Allied invasion of Western Europe inevitable, the Allies sought to obscure the true landing site—Normandy. Operation FORTITUDE SOUTH sought to convince the Germans the true location of the invasion would be at Pas de Calais so that the German forces located there would not react to the Normandy landings. Fortitude South consisted of two phases. During phase I, the objective was to cause the German forces to make faulty troop dispositions by convincing German High Command that Pas de Calais was the true target for invasion, with a target date of 45 days after the Normandy landings. For phase II, the objective was to cause German High Command to keep the units in Pas de Calais in place. This was to be accomplished by convincing German High Command the Normandy landings were a diversionary feint, and that once the German reserves were committed at Normandy, the true invasion would take place.[308] FORTITUDE SOUTH leveraged the existing German perception that Pas de Calais was the logical invasion choice.

The primary elements of FORTITUDE SOUTH were a simulated command and disinformation transmitted via the DOUBLE CROSS agents. The First U.S. Army Group [FUSAG] was a real headquarters without forces. General Patton was assigned as the FUSAG commander as part of the deception plan. FUSAG simulated and portrayed an army group through the use of decoys, dummies, and tasked units.[309] Many of the simulated units assigned to FUSAG were not created for FUSAG; rather, they were part of a long running effort to inflate the Allied order of battle and had been used in previous deceptions. In addition to the simulated units, a number of real units were notionally assigned to FUSAG, while actually remaining under the command of the 21st Army.[310] Much of the information on the location, composition, and activities of FUSAG was fed to German intelligence through the DOUBLE CROSS system.[311] Additional indicators were

[308] Hesketh, *Fortitude*, 384.

[309] Whaley, *Stratagem* (2007), 376 – 377.

[310] Hesketh, *Fortitude*, 174 – 185.

[311] Hesketh, *Fortitude*, 174 – 185. Agents GARBO and BRUTUS were the primary channels used.

presented by radio nets portraying the notional units. The few German reconnaissance aircraft flying over the FUSAG simulation were fired upon for realism, but intentionally missed so the photos would make it back.[312] As D-Day neared, additional events were staged in support of FORTITUDE SOUTH. Pas de Calais was included in the preparatory bombings to reinforce that it was the target.[313]

After the successful landings at Normandy, FORTITUDE SOUTH was continued into July, until a sequel plan could be executed. The objective of Operation FORTITUDE SOUTH II was "To contain the maximum number of enemy forces in the Pas de Calais area for as long as possible."[314] As elements notionally assigned to FUSAG arrived to reinforce the Normandy beachhead, local German commanders quickly realized the Pas de Calais threat was over; however, FORTITUDE SOUTH II convinced Hitler of the threat, keeping the German Fifteenth Army unable to respond to the growing threat in Normandy.[315] Elements of FORTITUDE SOUTH II remained in effect until the beginning of September.[316]

Deception Objective (DO)	Phase I – German forces commit to faulty troop distributions Phase II – German forces in Pas de Calais do not respond to Normandy landings
Deception Target	Hitler and German High Command
Deception Story (THINK)	Pas de Calais is the primary target of Allied efforts, the Normandy landings are a diversion
Deception Events (SEE)	Simulation – Decoy and dummy equipment Simulation – Radio traffic Portrayal – Assigned units Demonstration – Assignment of Patton as FUSAG Commander Disinformation – plans fed through DOUBLE CROSS agents Feint – Inclusion of Pas de Calais in preparatory bombing
Termination Trigger	Initially successful Normandy landings, extended via sequel

2. 23rd Headquarters Special Troops

The 23rd Headquarters Special Troops was a purpose built unit specifically intended to conduct deception operations at the tactical level. The unit consisted of a Headquarters and Headquarters Company; the 603rd Engineer Camouflage Battalion (Special); the Signal Company (Special); the 402nd Engineer Combat Company (Special); and the 3132nd Signal Company (Special).[317] The 23rd utilized a variety of means to simulate or portray other army units to include: decoys, dummies, loudspeakers, pyrotechnics, and imitative radio transmissions. Furthermore, the 23rd employed disinformation—the 23rd called this "Special Effects—to corrupt the German perceptions of the Allied Order of Battle. "Special Effects" included the wear of other unit's patches, stenciling vehicles with other unit designations, creating phony generals, and crafting fictional stories; all to be picked up by the German agent networks operating behind Allied lines.[318]

The techniques implemented by the 23rd played a vital role in operations throughout the campaign in Western Europe by depriving German intelligence of the true picture of Allied force dispositions. In particular, the 23rd played a critical role in the relief of Bastogne during the Battle of the Bulge. The objective of Operation KODAK was:

> To confuse German radio intelligence as to the real location of the 80th Infantry Division and the 4th Armored Division, both of which were committed to action in a counterattack against the south flank of the St. Vith-Bastogne salient, by giving radio indication of those Divs in an area to the southeast of that in which they were employed. The area chosen for the radio deception was such as to indicate their presence as a reserve in case of extention [*sic*] of the German counterattack through Echternacht.[319]

The surprise arrival of two divisions of reinforcements broke the back of the siege of Bastogne.[320]

Deception Objective (DO)	
Deception Target	Field Marshall von Rundstedt – German commander outside Bastogne
Deception Story (THINK)	The 4th Armored Division and 80th Infantry Division were being held in reserve
Deception Events (SEE)	Portrayal – Radio traffic by 23rd Securing – Radio silence by actual units
Termination Trigger	Arrival of the 4th and 80th at Bastogne

Table 16. Deception Analysis of Operation KODAK

3. Operation WEDLOCK

In 1943, Joint Security Control—the staff element of the Joint Chiefs of Staff charged with coordinating U.S. strategic deception—directed Lieutenant General Simon Bolivar Buckner Jr., the commander of the Alaska Department to develop a strategic plan for the North Pacific. The objective given Buckner was:

> …to deceive the Japanese about US plans for Alaska and the Aleutians by exaggerating current American forces and their activities there, and more specifically, to convince the Japanese of a build-up intended to invade the Kurile Islands. Tentatively this fictional assault was first slated for 1 August 1944.[321]

Buckner's initial plan was altered after consultation with Admiral Nimitz. Nimitz assumed command of the strategic aspects of the deception, while Buckner retaining command of the tactical aspects. Nimitz also accelerated the target date for the assault to 15 June so as to provide cover for Operation FORAGER, the planned real assault on Saipan. The revised deception plan became Operation WEDLOCK. In order to present the appearance of increased U.S. preparations for the invasion of the Kurile Islands, WEDLOCK called for the simulated activation of the 9th Amphibious Force consisting of five U.S. and one Canadian division. Additionally, the 9th Fleet would be notionally increased in size in order to support the assault. To create the simulated radio traffic necessary for these formations, a joint communications center was established.[322]

[321] Katherine Herbig, "American Strategic Deception in the Pacific," in *Strategic and Operational Deception in the Second World War*, edited by Michael Handel, 260 – 300, (London: Frank Cass, 1987), 266.

[322] Herbig, "American Strategic Deception," 266 – 267.

In addition to the notional forces, WEDLOCK included a number of other deception events in support of the story. WEDLOCK coopted the American press—ULTRA intercepts confirmed that Japanese intelligence used the press as a means of collection. Rather than keeping the meeting between Buckner and Nimitz a secret, the press was encouraged to report the meeting and speculate on its meaning. In addition, Joint Security Control fed disinformation directly to Japanese intelligence through double agents in the U.S.; via military attaches in neutral countries; and by incorporating disinformation into shared intelligence with Russia—expecting the disinformation to be collected by Japanese agents. Furthermore, troops embarking for the tropics through Seattle were issued artic gear so as to appear that they were heading north. Finally, an entire simulated airbase was constructed at Holtz Bay on the westernmost Aleutian island.[323]

After the invasion of Saipan was completed, it was decided to maintain aspects of the WEDLOCK deception, specifically the simulated divisions. Therefore, a sequel plan was implemented under the name Operation HUSBAND. Operation HUSBAND was later followed by another sequel plan, Operation BAMBINO, which in turn was eventually followed by Operation VALENTINE. Each of the sequel plans maintained the simulated forces, though with less and less effort in maintaining the deception. As a result, the Japanese Imperial Command over time withdrew ships and planes from the Kurile Islands to meet more imminent threats; however, the troop levels remained steady throughout the series of deceptions.[324]

The effect of WEDLOCK can be seen in Japanese troop strengths in the Kurils. Whereas there were initially 25,000 troops and 38 aircraft stationed in the Kurils before WEDLOCK, after WEDLOCK the garrison had grown to 70,000 troops and 590 aircraft.[325] However, while WEDLOCK succeeded in convincing the Japanese of a serious threat from the North:

> …it failed to convince him that this menace was immediate or of primary importance. Rather than misleading the Japanese into reordering their priorities for the threats which faced them, the deception added another plausible threat to an already ambiguous situation.[326]

While not as successful as desired, WEDLOCK could be classified as good enough.

Deception Objective (DO)	Japanese shift forces to defense of Kurile Islands
Deception Target	Japanese Imperial Command
Deception Story (THINK)	U.S. intends to liberate Kurile Islands from Japanese occupation
Deception Events (SEE)	Portrayal – increased size of the 9th Fleet Portrayal – Troops issued artic gear Simulation – radio traffic Simulation – 9th Amphibious Force Disinformation – Press stories Disinformation – Double agent network Disinformation – Military attaches Disinformation – Russia information exchange
Termination Trigger	

Table 17. Deception Analysis of Operation WEDLOCK

F. KOREAN WAR – INCHON LANDING

In 1950, General MacArthur approved Operation CHROMITE, an audacious plan to conduct an amphibious assault at Inchon to break the impasse with North Korean forces to the South. To conduct the operation, General MacArthur directed the formation of X Corps under the command of Major General Edward Almond, General MacArthur's Chief of Staff. As cover for the preparations for Operation CHROMITE, Major General Edward Almond remained as the Chief of Staff, while the staff for X Corps was formed as the Special Planning Staff, and the forces assigned to X Corps were carried as GHQ reserves.[327]

Since it was impossible to camouflage the amphibious assault preparations, a deception plan was needed to mislead the North Korean People's Army [NKPA] command as to the true point of decision. A multi-faceted effort was undertaken to mislead the NKPA command into believing the port city of Kunsan as the actual target so

[326] Herbig, "American Strategic Deception," 275.

[327] *Headquarters X Corps War Diary Summary for Operation Chromite: 15 August to 30 August 1950* (1950), accessed 24 January 2012, http://cgsc.cdmhost.com/utils/getfile/collection/p4013coll11/id/831/filename/832.pdf, 2.

the NKPA would not disrupt the actual landing. Kunsan, located one hundred miles to the south of Inchon, was a likely target for assault—it had been one of the three courses of action during planning. First, Kunsan was given particular attention during the preparatory bombing operations, to include a massive operation four days prior to the Inchon landing. Second, the 1st Marine Division was publicly given briefings on the hydrology at Kunsan. Third, an amphibious feint/portrayal was conducted at Kunsan using an ad hoc special operations element, whose purpose was to create the perception of a much larger force.[328] Additionally, the 1st Marine Brigade, which was the primary landing force at Inchon, was assigned to the Pusan 'general reserve' in an effort to blend it in with other less essential units.[329] In order to add a bit of ambiguity to the situation, similar efforts—preparatory naval bombardments—were made for Samch'ok, a plausible amphibious landing objective on the east coast of the peninsula.[330] The Inchon landing could not have succeeded without the operational surprise created by the deception plan.

Deception Objective (DO)	North Korean forces do not disrupt Inchon landing
Deception Target	North Korean People's Army command
Deception Story (THINK)	Actual amphibious landing will occur at Kunsan or Samch'ok
Deception Events (SEE)	Feint/Portrayal – Special Operations Company landing at Kunsan Feint – Kunsan focus of major bombing attack at D-4 Feint – Samch'ok focus of preparatory naval bombardment Demonstration – public briefing on hydrology at Kunsan Blending – preparatory bombings at Inchon blended into larger bombing operation Blending – assault element assigned to the Pusan 'general reserve' Blending - Major General Almond remaining Chief of Staff
Termination Trigger

G. VIETNAM WAR

1. MACVSOG

a. Sacred Sword Patriots League

When MACVSOG was established in 1964, one of the objectives in OPLAN 34A was to "create the impression that an active, unified, internal opposition exists in North Vietnam."[331] OPLAN 34A directed the creation of an impression because MACVSOG was prohibited by policy decisions made in Washington from implementing an actual unconventional warfare campaign in North Vietnam.[332] As a result, MACVSOG implemented a complex deception program to create the perception of a growing and active underground movement with the objective of forcing the North Vietnamese government to withdraw support for the Viet Cong. The notional resistance movement was part of Project HUMIDOR, MACVSOG's psychological operations program.[333] The centerpiece of MACVSOG's plan was the Sacred Sword Patriots League [SSPL]. The SSPL was presented as an anti-foreign power, Vietnamese nationalist party with its roots in the anti-colonial struggles against the French.[334]

The SSPL deception was supported by a number of operations. First, North Vietnamese fishermen captured as part of MACVSOG's maritime operations were taken to

---

[331] Special Assistant for Counterinsurgency and Special Affairs (SACSA), *Draft MACSOG Documentation Study Appendix A Summary of MACSOG Documentation Study* (Washington, DC: Joint Chiefs of Staff, 1970), accessed 2 September 2011, http://www.dod.gov/pubs/foi/International_security_affairs/vietnam_and_southeast_asiaDocuments/520-22.pdf, a-18.

[332] Special Assistant for Counterinsurgency and Special Affairs (SACSA), *Draft MACSOG Documentation Study Annex A to Appendix C Psychological Operations* (Washington, DC: Joint Chiefs of Staff, 1970), accessed 2 September 2011, http://www.dod.gov/pubs/foi/International_security_affairs/vietnam_and_southeast_asiaDocuments/520-1.pdf, C-a-7 to C-a-13. MACVSOG attempted on three separate occasions between 1965 and 1968 to gain approval to execute an actual unconventional warfare plan against North Vietnam.

[333] John Plaster, *SOG: The Secret Wars of America's Commandos in Vietnam* (New York: Penguin Group, 1998), 125.

[334] Special Assistant for Counterinsurgency and Special Affairs (SACSA), *Draft MACSOG Documentation Study Annex A to Appendix C Psychological Operations*, C-a-14 to C-a-15. The sacred sword was a reference to a Vietnamese legend about a heaven-sent sword used by Le Loi during his nationalist campaign to drive the Chinese from Vietnam in the 15th Century. The SSPL story reflects an exceptional attention to detail with regards to the targeted culture. See Shultz, *Secret War*, 139 – 14.

the Paradise Island facility that portrayed an active SSPL camp.[335] While the fishermen were subjected to SSPL indoctrination, the primary objective was not to actually turn the fishermen into operatives; rather:

> The primary objective of capturing prisoners and leading them to believe that they were captives of the SSPL was to establish credibility for the organization and convince elements of the populace of [North Vietnam] that an opposition organization does exist in [North Vietnam].[336]

In addition to the Paradise Island facility, support for the SSPL deception included the Voice of the Sacred Sword Patriots League, a portrayed radio station ran by MACVSOG's psychological operations element, and leaflet drops of SSPL propaganda.[337]

While the SSPL program did not achieve its primary objective of forcing the North Vietnamese government to stop or reduce support for the insurgency in the South, the program was effective at forcing the North Vietnamese government to increase internal security measures. A study of North Vietnam's response to covert operations, concluded that "Hanoi interprets allied special operations in North Vietnam as a major facet in the US strategy. As such it views these operations with considerable alarm."[338] Additionally, the end to all covert activities in North Vietnam was included in the initial 'price for peace' demands by the North Vietnamese contingent at the Paris peace talks.[339] The SSPL program was effectively ended with the 1 April 1968.[340]

Deception Objective (DO)	North Vietnam reduces support to South Vietnamese insurgency
Deception Target	Ho Chi Minh and North Vietnam leadership
Deception Story (THINK)	The SSPL is an active resistance movement challenging the Communist government of North Vietnam
Deception Events (SEE)	Portrayal – Paradise Island operations Disinformation – SSPL radio station and leaflet drops
Termination Trigger	Since deception was in support of the overall campaign there was no defined termination trigger. Termination occurred in response to North Vietnamese negotiation demands.

Table 19. Deception Analysis of SSPL

b. Deception in Support of Security

In addition to the SSPL program, MACVSOG utilized deception in support of a robust organizational security program. As part of the security program, MACVSOG, as well as all the major subordinate components, had an official cover story in an attempt to disguise the true nature of the organization. The official cover story for MACVSOG was:

> Studies and Observations Group (SOG): "Studies and Observations Group is a special staff section of Headquarters, United States Military Assistanct [*sic*] Command, Vietnam (USMACV) under the supervision of the Chief of Staff, USMACV. It is responsible for the study an observation of joint or combined counterinsurgency operations of a comprehensive nature. The studies and observations include intelligence and psychological activities as well as combat actions that may involve any forces or resources of any service of the Republic of Vietnam Armed Forces (RVNAF) and USMACV. SOG is not an implementing agency, the operations it studies and observes are conducted by the RVNAF commands which have responsibility for the areas of observations.[341]

In addition to the overarching cover stories, individual missions were given cover stories. For example, if an aircraft conveying agent teams or equipment between South Vietnam and Thailand had an incident necessitating an explanation for the mission, the explanation was that the aircraft was diverted from routine operations in South Vietnam in order to respond to a distress call.[342]

[342] Special Assistant for Counterinsurgency and Special Affairs, *Draft MACSOG Documentation Study Appendix H Security, Cover & Deception*, H-12.

Deception Objective (DO)	Ignore MACVSOG
Deception Target	Everyone without need-to-know
Deception Story (THINK)	MACVSOG is a staff element used to collect data, not an operational headquarters
Deception Events (SEE)	Disinformation – cover stories
Termination Trigger	Since deception was in support of the overall campaign there was no defined termination trigger

Table 20. Deception Analysis of MACVSOG Security

2. MACV

Elements of the Military Assistance Command, Vietnam (MACV) utilized deception in their operations against the Viet Cong and the North Vietnamese Army. In one case, the 25th Infantry Division learned of an inexperienced NVA regiment with orders to seek out an allied base as a way of building experience and morale. At the recommendation of the division staff, the commander of the 25th decided to provide the enemy with a suitable target. In February 1969, an infantry company established firebase DIAMOND I in the vicinity of the enemy force. What the NVA saw as a vulnerable target was in reality ringed with sensors and ground radar systems, and supported by three artillery support bases and air support. When the NVA decided to attack the firebase the sensor array deprived the NVA of surprise. Supported by the artillery bases and air support, the firebase repulsed two attacks with minimal casualties, while the NVA regiment was decimated. This stratagem was repeated by the 25th Infantry Division with at three additional firebases with similar successes. Repetition of the stratagem was achievable because establishing new firebases was a routine occurrence. While using troops as bait may seem distasteful, the stratagem was effective; moreover, by establishing DIAMOND I, the 25th Infantry Division was able to influence the NVA into attacking on the 25th's terms. The alternative would have meant allowing the NVA force to attack any one of a number of bases.[343]

In analyzing this deception, it is interesting to note that the deception was not the force, rather the purpose of the force. As the report noted, had the NVA not acted on the

[343] *Reference Book 31-40: Techniques for Deception*, 6-16.

Page 839 of 3957

deception, the unit was still available to conduct patrolling operations.[344] The deception goal was to incite the NVA to attack a specific firebase in order to neutralize the threat. The deception story was that the DIAMOND firebases were just more of many firebases, but conveniently located for attack: a variation of cry-wolf with an element of honeypot.

Deception Objective (DO)	NVA attacks DIAMOND firebases
Deception Target	NVA leadership in 25th Infantry Division area of operations
Deception Story (THINK)	DIAMOND firebases are perfectly positioned for NVA attack
Deception Events (SEE)	Portrayal – DIAMOND as typical firebase
Termination Trigger	On order once threat around firebase was disrupted

Table 21. Deception Analysis of DIAMOND I

In another example, prior to an attack on a Viet Cong (VC) stronghold, a ranger battalion conducted operations with heavy artillery support leading away from the VC base area. At the same time an Army of the Republic of Vietnam (ARVN) battalion similarly conducted operations moving away from the stronghold. After the feints were completed, the Ranger and ARVN troops were airlifted back to attack the stronghold. A prisoner captured during the assault on the stronghold indicated that the Ranger and ARVN battalion's movements lulled the VC into believing the base area was not the target of the operation. Usually feints are used to draw enemy forces away from the decisive point, but knowing how the enemy will react allowed the feints to achieve the opposite result. In this case, the feints of the Ranger and ARVN battalions were successful in convincing the VC to remain at the decisive point.[345]

Deception Objective (DO)	VC force remains at the stronghold
Deception Target	VC stronghold commander
Deception Story (THINK)	It is safe to remain at the stronghold because the Ranger and ARVN battalions do not know about it
Deception Events (SEE)	Feint – Ranger battalion operation moving away from stronghold Feint – ARVN battalions operation moving away from stronghold Simulation – additional camp fires
Termination Trigger	Assault on stronghold

Table 22. Deception Analysis of Ranger Assault

H. OPERATION DESERT STORM

Operation DESERT STORM provides an exemplar of how the concepts of deception work together to achieve the desired effect. According to General Schwartzkopf, Coalition forces implemented the "Hail Mary" plan because unfavorable force ratios—the Iraqi forces in Kuwait had numerical superiority and were in the defensive—precluded a frontal assault. Therefore, the flanking maneuver was essential for countering the Iraqi force advantage. [346] Deception became key to distracting Saddam from the "Hail Mary" preparations:

> The goal of the deception was to convince the Iraqis that the main attack would come up Wadi Al Batin along the Kuwaiti-Iraqi western border. This attack would be supported by an amphibious attack from the northern Gulf and attacks directly into the defenses along the southern Kuwaiti border. The desired effect was to hold the RGFC and the professional army, the regular armor and mechanized divisions, oriented upon the Wadi and coast. This disposition would expose them to the VII and XVIII Airborne Corps enveloping maneuver and facilitate their destruction.[347]

This deception plan played to Saddam's expectations, as early intelligence reports indicated a concern about amphibious operations and a belief that an attack through the desert was impossible.[348]

The first step of the deception plan was the removal of Saddam's primary channel for intelligence—the Iraqi Air Force.[349] Prior to the start of the air campaign, reconnaissance and logistical preparations for the envelopment were prohibited, with all activity limited to reinforcing the perception of the main effort coming through Wadi Al Batin. In response to the staging of forces at the mouth of the wadi, Iraqi forces reinforced their positions on the other side. Within the assembly areas, "Virtually every division constructed replicas of Iraqi defensive positions and conducted extensive

[348] Breitenbach, "Operation Desert Deception," 10 – 11.

[349] Schwarzkopf, "Central Command Briefing," 97.

training against them."[350] The press pool was allowed access to report on this training, but not to the maneuver training necessary for the flanking maneuver. Once the air campaign was started, and the threat of the Iraqi Air Force removed, VII Corps and XVIII Corps moved from their staging areas south of Wadi Al Batin to their new staging areas in the western desert. As a security measure for the movement, and to maintain the illusion that the two Corps were still in place, other units still located in the original staging areas portrayed the XVIII Corps using false radio traffic.[351]

Portraying a secondary effort, the II Marine Expeditionary Force conducted several amphibious training exercises, including Operation IMMINENT THUNDER. These demonstrations had the intended effect of causing seven Iraqi divisions to shift to the Kuwaiti Coast.[352] The press was given access to cover these amphibious training operations as well, providing another channel to Saddam on the Coalition's intent to conduct an amphibious landing.[353] The amphibious demonstrations were further reinforced by PSYOP leaflets showing a tidal wave shaped like a Marine washing over Iraqi soldiers.[354] On the morning of 24 February, SEAL Task Force Mimke conducted an amphibious feint, supported by naval gunfire, to reinforce the threat of landings in order to prevent the reallocation of the Iraqi divisions on the coast.[355]

The deception operations may have worked a little too effectively. When the 1st Cavalry Division launched its feint on 24 February through Wadi Al Batin, it met little resistance. The Joint Forces Command East and I Marine Expeditionary Force similarly met little resistance along the coast. The Iraqi forces were so concerned with being flanked by an amphibious landing they had withdrawn forty kilometers north. The quick advance of these forces necessitated the launch of the Hail Mary eighteen hours early.

[351] Breitenbach, "Operation Desert Deception," 5.

[352] Breitenbach, "Operation Desert Deception," 4.

[353] Schwarzkopf, "Central Command Briefing," 102. It's important to note that the press were not actively deceived or given disinformation to publish. They were afforded the opportunity to observe actual training and allowed to draw their own conclusions and report on it as they saw fit.

[354] Herbert Friedman, "Leaflets of Operation Desert Shield and Desert Storm," accessed 25 May 2012, http://www.psywarrior.com/HerbDStorm.html.

[355] Breitenbach, "Operation Desert Deception," 7.

The rapid withdraw of Iraqi forces and the resultant rapid advance of Coalition forces into Kuwait sufficiently upset the operation's synchronization that Schwarzkopf and his ground commanders were forced to sacrifice some initiative in order to reset synchronization.[356]

Deception Objective (DO)	Iraqi forces concentrate away from "Hail Mary" flanking movement
Deception Target	Saddam
Deception Story (THINK)	Coalition main effort will come through Wadi Al Batin with supporting amphibious landing
Deception Events (SEE)	Demonstration – 1st Cavalry Division entry into Wadi Al Batin Demonstration – II Marine Expeditionary Force's amphibious training Demonstration – Training facilities in the assembly areas Disinformation – PSYOP using amphibious imagery Portrayal – Radio traffic of XVIII Corps Blending – Radio silence by XVIII Corps
Termination Trigger	On order

VII. CONCLUSIONS AND RECOMMENDATIONS

> *As a nation we are bred up to feel it a disgrace even to succeed by falsehood… we will keep hammering along with the conviction that 'honesty is the best policy,' and that truth always wins in the long run. These pretty little sentences do well for a child's copy-book, but the man who acts upon them in war had better sheathe his sword forever.*
>
> *– Colonel Sir Garnet Wolseley*[357]

A. CONCLUSION

Deception has demonstrated its utility in the exercise of war since the dawn of recorded history. Even within the more limited scope of U.S. Army operations, deception has proven its worth time and again, from helping to save the Continental Army from sure destruction during the Revolutionary War to assisting in the rapid and complete defeat of a numerically superior foe during Operation DESERT STORM. Likewise, deception has proven its worth against conventional foes such as the German and Iraqi Armies, and against irregular foes like the Viet Cong and the Philippine insurgents. Given the demonstrated worth of deception across the spectrum of operations and against myriad opponents, it is unacceptable to see the lack of emphasis given deception in current Army doctrine.

The level of emphasis of deception within U.S. Army doctrine has waxed and waned between 1905 and 2012. A number of explanations for this fluctuation have been presented, e.g., morality, the American style of war, and a professional officer class. The fluctuation is perhaps best explained by the perceived balance of power with the nation's adversaries and the resultant leaning towards either the cumulative destruction or systemic disruption styles of war. When the U.S. Army perceives it has a force advantage—as has been the case since the end of the Cold War—then weight is given towards cumulative destruction, while systemic disruption and deception wanes. Conversely, when the U.S. Army perceives a force disadvantage—as was the case during World War II and the period of the 1970s through Operation DESERT STORM—then

[357] Garnet Wolseley, *The Soldier's Pocket-book for Field Service*, 2nd ed. (London and New York: MacMillian and Co., 1871), 81.

weight is given systemic disruption and deception, while cumulative destruction wanes. If this is indeed the case, then the emerging era of austerity and economy of force roles would seem to suggest a shift towards systemic disruption and with it deception is in the offing. Furthermore, since balance of power ratios are essentially meaningless against adversaries relying on heavily systemic disruption approaches—e.g., Al Qaeda and other non-state actors—deception would appear to be of increased utility. However, the most recent capstone doctrine publications *ADP 3-0 and ADRP 3-0* between them have a single bullet point mentioning deception without elaboration.[358] As the U.S. Army seeks to do more with less, it must take to heart Whaley's observation about the cost of deception:

> Stratagem is cheap. It requires a very small initial investment of men and materiel. Effective stratagem can be the part-time work of only one man, particularly if he is the commander. And the most elaborate of such operations involved only diverting for a few weeks the services of several hundred men, a dozen or so small boats, a few aircraft, a fair amount of radio and other electronic gear, some wood, canvas, and paint, and bits of aluminum scrap. None of this was permanently lost to inventory, except the aluminum.[359]

B. RECOMMENDATIONS

What follows are some recommendations the U.S. Army should adopt to address the current shortfall of deception emphasis within doctrine and operations. These recommendations are an economy of force middle ground between the current doing nothing, and the actions of a resource rich U.S. Army. If resources and personnel were as effectively unlimited as they were in World War II, these recommendations would include a call for purpose built deception support battalions—modern versions of 23rd Headquarters Special Troops. However, this recommendation is unfeasible in the current fiscal and force cap environment, thus the recommendations focus on increasing the capabilities of existing units and personnel.

[359] Whaley, *Stratagem* (1969), 232.

1. Doctrine

"Capstone doctrine establishes the Army's view of the nature of operations, the fundamentals by which Army forces conduct operations, and the methods by which commanders exercise mission command;" therefore, in order for deception to be fully integrated into U.S. Army operations, deception must be fully integrated into U.S. Army doctrine.[360] The current single bullet guidance in *Army Doctrine Reference Publication 3-0: Unified Combat Operations* of "conduct military deception" without further elaboration must change to something along the lines of the guidance in *FM 100-5* (1954), which stated: "It is imperative that commanders constantly realize the importance of combat deception and that they train their troops and staff in the techniques and planning for combat deception."[361]

To achieve full integration of deception within Army doctrine, an office dedicated to the proponency of military deception must be created at either the Mission Command Center of Excellence or the Special Warfare Center and School. The office must have the single mission of proponency for deception, because prior history indicates that deception suffers when it is a secondary task. This office must have the mandate for active military deception and coordination authority with the proponents for the cover aspects of deception, e.g., camouflage, OPSEC, and counterintelligence. In addition to coordination authority, the deception office must be incorporated into the approval process for doctrine related to the covering aspects of deception so as to ensure unity of effort in the presentation of deception doctrine. Finally, all formal education on active deception must be either consolidated under the auspices of, or the programs of instruction approved by, the deception office; again to ensure unity of effort and message.

In the development of deception doctrine, the focus should be on theory with illustrative examples illuminating the theory in an operational context. The purpose of the doctrine should be to spark creative thought on how deception might be practiced, not to dictate how deception is practiced. Additional emphasis should be given to the

[360] Headquarters, Department of the Army, *Army Doctrine Publication 3-0*, 1.

[361] Headquarters, Department of the Army, *Army Doctrine Reference Publication 3-0*, 37.

information requirements needed to develop a full understanding of the target. Particular care must be taken to ensure that doctrine does no prescribe particular techniques or template approaches; a doctrinaire or dogmatic approach would create the potential disastrous situation of predictable deception.

2. Leadership, Education, and Training

Integration of deception into U.S. Army operations demands that leaders embrace the potential of deception as part every operation. There are two ways to inculcate a respect for the utility of deception in leaders. First is for senior leaders at the upper echelons of the U.S. Army to direct deception integration into all training operations as a forcing function, especially at the combined arms training centers. Commanders who are accustomed to integrating deception into field training exercises beginning during the formative stages of their careers will be more apt to integrate deception into actual operations. Care must be exercised to ensure that the integration of deception into training does not degenerate into a templated, predictable process, as the use of variety is an essential factor in deception success.

Second is for leaders at the lowest echelon practical to receive formal education in deception (Table 24). As the earlier a leader is trained and aware of the utility of deception the more likely deception will be integrated into the leader's planning methodology. Additionally, the educating and implementing at the lowest levels helps to ensure that as personnel advance, their experience with deception advances as well. If company commanders receive formal education on deception, then as they move up into senior leadership and staff positions they will carry the education with them, so that the majority of staff members from battalion and up will have training and experience in deception. The combination of the top down forcing function coupled with the bottom up education will serve to inculcate the idea of deception in the force more thoroughly than either approach by itself. This will help to bring the situation described in 1941 *Field Service Regulations of Operations* to fruition:

> A commander who is ingenious and resourceful in the use of tactical strategems [*sic*] and ruses often will find methods of deceiving or misleading the enemy and of concealing his own intentions.[362]

As with deception doctrine, formal deception education should focus on the theory of deception, especially the target's decision-making process, and the concepts of biases, schemata, and heuristics. In addition to theory, formal education should include an emphasis on the information requirements for profiling potential targets. Illustrative examples drawn from prior uses of deception should be used to illuminate the theory within an operational context, but not as examples of "how to conduct" deception. What must be avoided in the formal education are any deception planning templates or guides that could result in a dogmatic approach to deception.

Table 24. Recommended Personnel for Formal Deception Education

[362] War Department, *Field Service Regulations of Operations, 1941*, 58.

3. Personnel Selection

The personnel holding the positions in Table 24 are the recommended recipients of formal deception education; however, this should not be interpreted as saying these personnel are the only ones involved in deception planning. Depending on the deception plan, other personnel may be needed, e.g., developing a notional order of battle will require a witting actor in the personnel section. Additionally, the fact a person occupies a position indicated in Table 24 does not imply the person is cut out for deception planning; more important than either the rank or the position are the personal characteristics of a deception planner. Deception planning requires a certain type of strategic thinker who has initiative and is creative, intelligent, mentally agile, and security conscious. A deception planner does not need to be "immoral" or "morally flexible;" rather, a planner needs to be able to set aside personal considerations for the accomplishment of the mission. Lieutenant Colonel Simenson, the operations officer for 23rd Headquarters Special Troops, was personally against the use of deception, but he did not let his personal feelings interfere with the mission.[363] That said, a person who is unable to set aside personal feelings on deception is best left as an unwitting actor.

A commander may feel the need to reach outside his staff for the best candidate; much like General Wavell requested Dudley Clarke by name to head up British deception efforts in North Africa during World War II.[364] Regardless of whom the commander chooses to lead his deception planning, the planner must be assigned to the unit. It is unrealistic and counterproductive to expect an outside element to assume deception planning for a unit. First, delegating responsibility to an outside element undermines the integration of deception into unit training and operations; when the outside element is not present during routine field training exercises neither is deception. Second, attaching a deception planning function serves to inhibit the growth of an organic capacity for deception within the unit by absolving the supported commander and staff of the planning responsibility. The commander responsible for the overall mission must also plan and execute the supporting deception stratagem.

---

[363] Gerard, *Secret Soldiers*, 85.

[364] Mure, *Master of Deception*, 58.

4. Facilities

Deception planning requires a segregated facility in order to control access to the deception plan. The segregated facility can be as simple as a lockable room to secure compartmentalized information. The critical requirement is that the facility is commensurate with the level of classification of the plan and supporting resources. At the same time, the deception planner cannot work in complete isolation from the rest of plans and operations. In order to ensure the deception plan is fully nested in the supported plan, the deception planner must also be physically integrated into overall operations planning, and therefore also needs to have a space that is connected to the plans space.

C. FINAL NOTE

As a final word of caution, the deception practitioner must remember that the past is a guide not a blueprint. As Roger Hesketh notes in his report on Operation FORTITUDE: "It is always unsafe to apply too literally the experiences of one war to the changed circumstances of another."[365] A good example of a historic technique which may no longer be appropriate is the use of troops to convey disinformation as prisoners. Magruder used troops portraying deserters to convey disinformation to McClellan; this tactic would be rightfully unacceptable today for U.S. planners—though interrogators must still watch for this deception in use by our adversaries.[366] Likewise, the use of a corpse as the central prop in Operation MINCEMEAT might have trouble making it through legal review today, or more importantly, the target's forensic capabilities. And the deliberate use of the press to convey disinformation as was the case with Operation WEDLOCK would surely cause significant blowback today. [367] This is not to say that these techniques cannot be adapted for use in the current operational environment; rather, that historic examples of deception must be adapted for usage in the current operating environment, with careful consideration given to the changes since the time the deception was executed.

EXECUTIVE SUMMARY

The Information Assurance Architecture (IAA) Panel was tasked to review the implementation of the 1996 Defense Science Board Task Force on Information Warfare Defense recommendations, to identify specific issues associated with information assurance goals of Joint Vision 2020 (JV2020), and to evaluate the adequacy of progress made in achieving these goals. The panel addressed the status of the Department of Defense's (DoD) efforts to establish an IAA framework and standards, and to develop promising IAA techniques. The panel invited representatives from the Services, various agencies, and information technology industries to brief on IA related technologies, trends and market demands. In general, the panel found that significant progress has been made in implementing the 1996 DSB recommendations, but critical issues need to be resolved in the context of JV2020.

The ability to achieve information superiority is the pacing item in realizing the goals of JV2020. The Global Information Grid (GIG) is the underlying infrastructure that will support information superiority. The panel believes the key to success is in implementing a standards-based, metric-driven, end-to-end integrated global information grid. The GIG will incorporate near-term information technologies to globally interconnect information capabilities, associated processes and personnel. Further, the GIG must exploit technologies, standards and architectural frameworks based on commercial information technologies (IT). The panel believes that the implementation of the GIG, in the context of JV2020, is one of those significant events that occur once every decade or two, and that how it is managed and architected will have a major impact on DoD for the next decade or more.

The panel argues that the GIG should be viewed as a weapon system since it leads to information/decision superiority and therefore will be attacked by our adversaries. However, unlike traditional weapons systems, the DoD does not own the critical elements of the GIG; it will be built from rapidly evolving commercial-off-the-shelf (COTS) components. In addition, the GIG can be more readily attacked due to low cost of entry for attackers and the fact that attack attribution is difficult.

The GIG today comprises the Non Secure Internet Protocol Router Network (NIPRNET), Secure Internet Protocol Router Network (SIPRNET), Joint Worldwide Intelligence Communications System (JWICS) and Service Tactical Command, Control, Communications, and Intelligence (C3I) systems. The panel found that each service is pursuing its own architectural implementation of the GIG and observes that, absent an office of primary responsibility, the GIG will not achieve Joint Weapons Systems status. The panel identified a set of DoD strategies for providing information assurance for the GIG: (1) pursue a disciplined implementation through consistent architectural framework; metrics; and commercial standards; (2) segment the communities, i.e., separate DoD from the general public and segment by classification and enclaves; (3) counter denial-of-service by segmentation, redundancy, diversity, and a restricted set of Internet access points; and (4) establish fine grained access control of computing and communication resources.

Page 872 of 3957

In addition to developing a strategy, the panel made several assumptions. The first is that the DoD will establish the Internet protocol (IP) as the convergence layer for the GIG. The second is that the Defense Information Infrastructure will migrate from Asynchronous Transfer Mode (ATM) to Internet Protocol (IP) services. The third is that the DoD will fully execute its Public Key Infrastructure/Public Key Enabler (PKI/PKE) strategy.

The panel recommended an Information Assurance (IA) reference model protocol stack that is almost consistent with the reference models used by International Organization of Standardization (ISO) and by the Transmission Control Protocol/Internet Protocol (TCP/IP) community, and is based entirely on commercial protocols. The panel also recommended a standard defense-in-depth approach that spans common user networks, command enclaves, and workstations or servers. It is recommended that all common user networks (SIPRNET, JWICS, and NIPRNET) adopt this approach, which has the feature of providing significant barriers to insider attacks.

The panel observed that the GIG includes commercial as well as DoD wireless connectivity and that the best protection for all wireless systems is at the physical layer. DoD has developed and deployed techniques for such protection; however, commercial wireless systems do not offer equivalent capabilities. Furthermore, both military tactical internets and commercial wireless systems depend on higher-level network processing (routers, user location databases, etc.) that are largely unprotected. Protection needs to be extended to these facilities to ensure robust mobile wireless operations. It will be essential to establish a consistent engineering approach for wireless use in the GIG.

The panel observed that metrics for information assurance are an important and inadequately addressed need. Researchers, designers, vendors and operators of information systems need a broad spectrum of metrics to achieve their respective objectives. The panel observes that it will be necessary to develop different sets of metrics for technical-, systems-, and mission-level evaluation. For instance, mission-level metrics would involve time to complete a mission, targeting and situation awareness accuracy. System-level metrics might include system downtime and response time to neutralize attacks. Technical-level metrics might include probability of attack detection vs. false alarms. The panel also observes that an architectural environment/testbed will be required for development of metrics and measurement of system performance in DoD-relevant operational scenarios and related information traffic flows. To achieve these objectives the testbed must facilitate collaboration and participation of research and development, evaluation and operational communities (services and agencies).

Based on the above, the panel made four principal recommendations: 1) the Secretary of Defense (SecDef) should establish a board of directors to provide oversight of the GIG (Deputy SecDef [Chair], Under Secretary of Defense for Acquisition, Technology & Logistics, VCJS, ASD/CSI, DCI); 2) the Board should establish an Executive Director and systems engineering organization to implement the GIG; 3) the executive director should be given responsibility for implementing the GIG based on a consistent systems architecture; and 4) the executive director should establish a GIG IA research and development (R&D) testbed to meet the need to continually test, evaluate, and evolve the GIG.

By implementing the recommendations and pursuing the layered architectural strategy, vulnerability to attack will be significantly reduced and attribution capabilities will be increased.

Page 873 of 3957

CHAPTER 1. INTRODUCTION

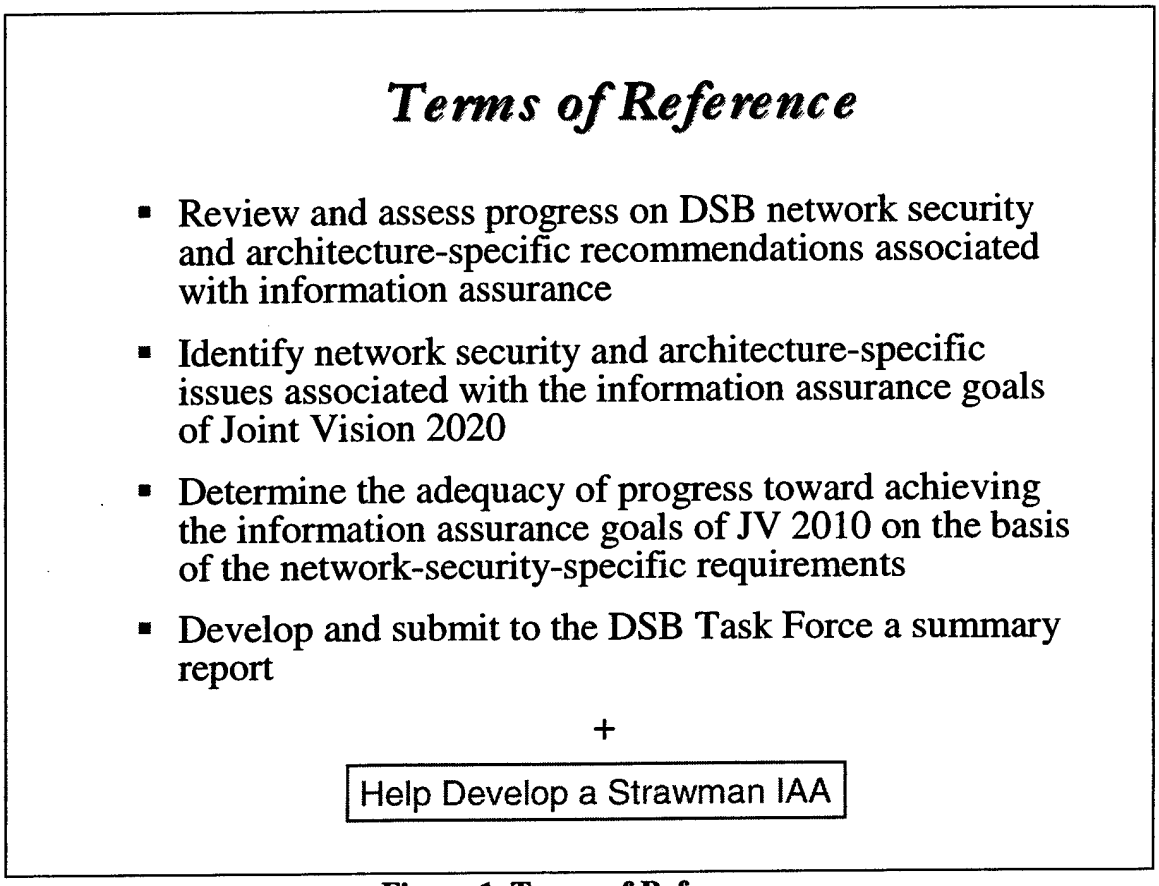

Figure 1. Terms of Reference

The Information Assurance Architecture (IAA) Panel was asked to review progress made by DoD toward implementing the recommendations made by the Defense Science Board's (DSB) 1996 Study on Information-Warfare-Defense (IW-D).[1] The panel was asked to specifically focus its analysis on those recommendations related to issues associated with DoD information infrastructure architecture initiatives.

At the first meeting of the IAA Panel, the members decided to extend their tasking to include a review of the status of DoD's efforts to establish an IAA framework. The panel felt that such a framework is a necessary foundation for deploying, over time, a DoD information infrastructure that provides a reasonable and understood degree of IA. The panel reviewed the following DoD information-system architectural components: (1) operational architecture (OA), (2) system architecture (SA), and (3) joint technical architecture (JTA). For purposes of IA, the panel added to this triumvirate the need for a reference model for IA – a model that sets a high level perspective of where and how IA services should be provided within the DoD information

[1] Reference 1996 DSB Study "Tactics and Technology for 21st Century Military Superiority"

infrastructure. The need and utility of an IA reference model was predicated upon the fact that such a tool exists and is used in the private sector. We sought to determine if a parallel was developed within DoD as part of its architectural framework for IA. The panel's Terms of Reference (TOR) are provided in Figure 1.

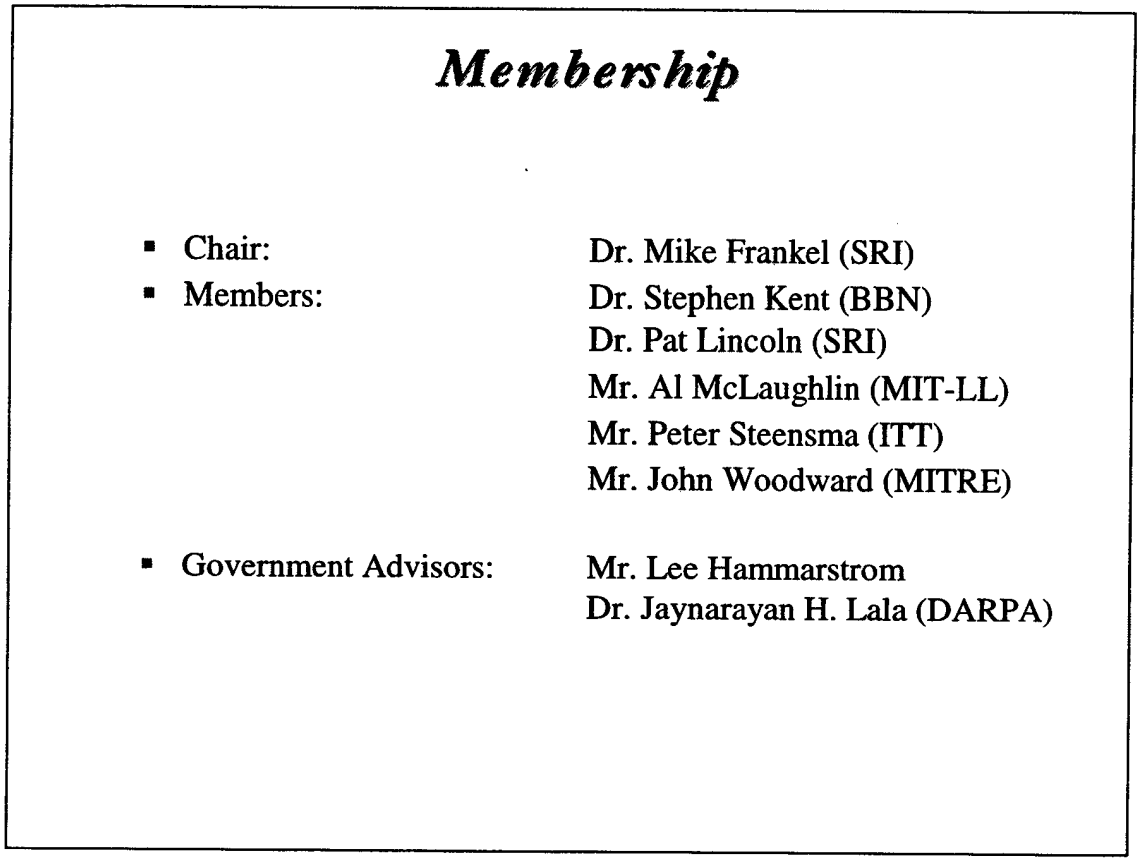

Figure 2. Panel Membership

The members of the IAA Panel who undertook the challenge of addressing the TOR are listed in Figure 2. The members include internationally recognized experts in IA. Their collective expertise included a deep understanding of IA technologies, systems and concepts for both wired and wireless information systems. This understanding included both commercial practices as well as DoD IA implementation and research/development initiatives.

The panel was supported by two government advisors who brought complementary backgrounds and knowledge regarding DoD IA initiatives. One advisor has been a key member of the DoD community architecting, developing, and deploying DoD IA technology for use by DoD Services and Agencies; the second individual brought an understanding of the present DoD IA Science and Technology (S&T) programs.

Brief biographies of the IAA Panel members are provided in Appendix B. Relevant IA backgrounds and experience are noted therein.

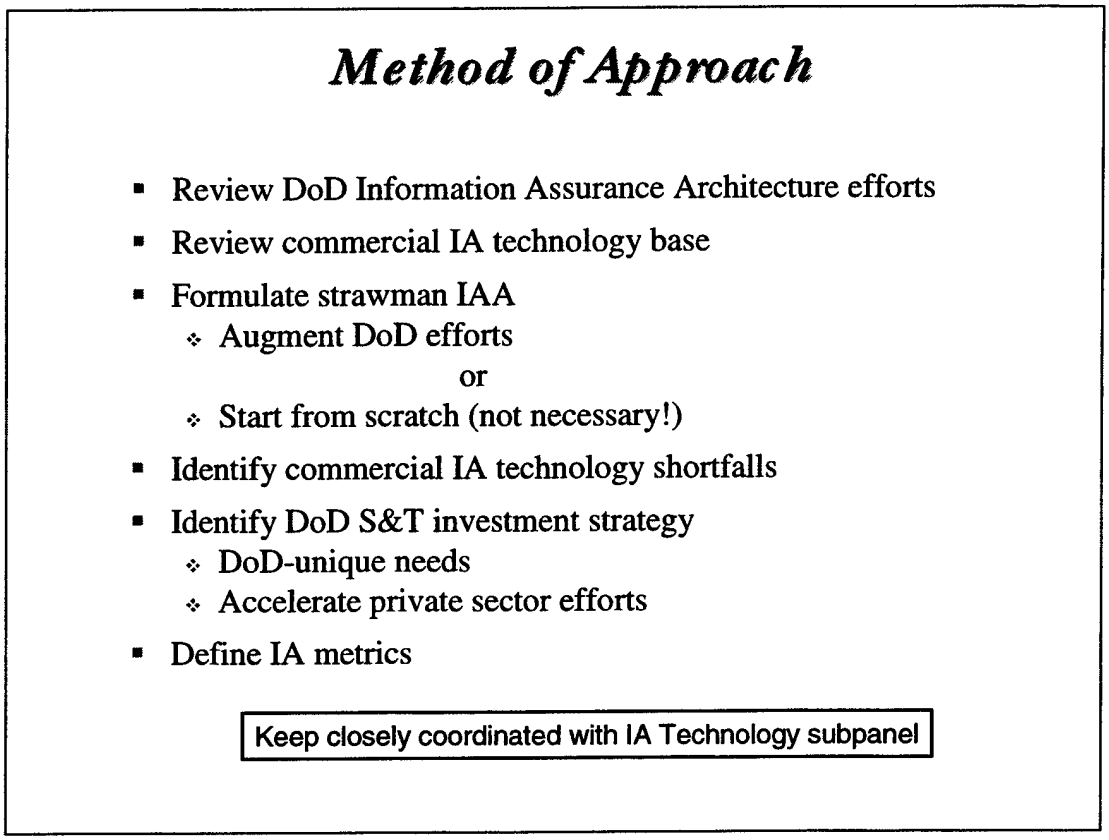

Figure 3. Method of Approach

The panel's method of approach for addressing its TOR was to invite DoD representatives from the various organizations supporting DoD IAA programs to brief the panel. Representatives from Office of the Secretary of Defense (OSD), the Services, and Agencies were selected. In addition, representatives from the private-sector information technologies (IT) industry were invited to brief the panel on IA-related technologies, trends, and market demands. Because DoD's information infrastructure, including IA elements, is highly dependent on the private-sector offerings, the panel felt that understanding the needs, goals, and IA architecture frameworks from both perspectives was critical to formulating the panel's findings and recommendations.

Based on this dual track assessment, the panel provided inputs to its companion IA Technology Panel. These inputs were intended to help identify DoD IA requirements for which the private sector would not necessarily provide solutions; thus, a DoD Science and Technology (S&T) investment would be appropriate.

Finally, the panel noted that to measure progress in achieving adequate IA for DoD's information infrastructure, metrics are necessary. At the outset, the panel realized that the definition and development of IA metrics within DoD has only started. The panel, therefore, decided to make IA metrics a key part of its deliberations, as noted in Figure 3.

Meeting Schedule/Planned Topics

2000	Briefings Received	Subject
Feb 22-23	11	Kick-off and IA Service Overviews and Threat Briefings
March 27-28	9	Panel Chairs Outbrief Progress and DoD requirements
April 19-20	15	Joint Vision 2010-2020, DARPA Initiatives, Adequacy of DoD architectures capable of meeting forecasted service and joint requirements
May 24-26	8	DSB Quarterly, DIO Panel briefings to DSB Members. Briefings from Industry and DARPA perspectives.
June 13-14	7	IA metrics, security standards, briefing on Chessmaster.
July 12-13	2	Network information assurance protection measures and Common operating environment. Present findings, develop recommendations and write draft report.
August 7-18	0	DSB Summer Study, final report.

Figure 4. Meeting Schedule

The panel was formed in February 2000 and conducted its business over a period of six months. The first several meetings were dedicated to receiving briefings and the latter to panel discussions and formulation of the findings and recommendations provided in this report.

As noted in Figure 4, a total of 52 briefings were received covering the topics and organizations noted therein. The major themes for each of the six meetings held are also noted in the figure. The specific briefings and briefers presented are provided in Appendix C.

The briefings and the backgrounds of the panel members provided the contextual and technical information that formed the basis of the findings and recommendations provided herein.

CHAPTER 2. VISION

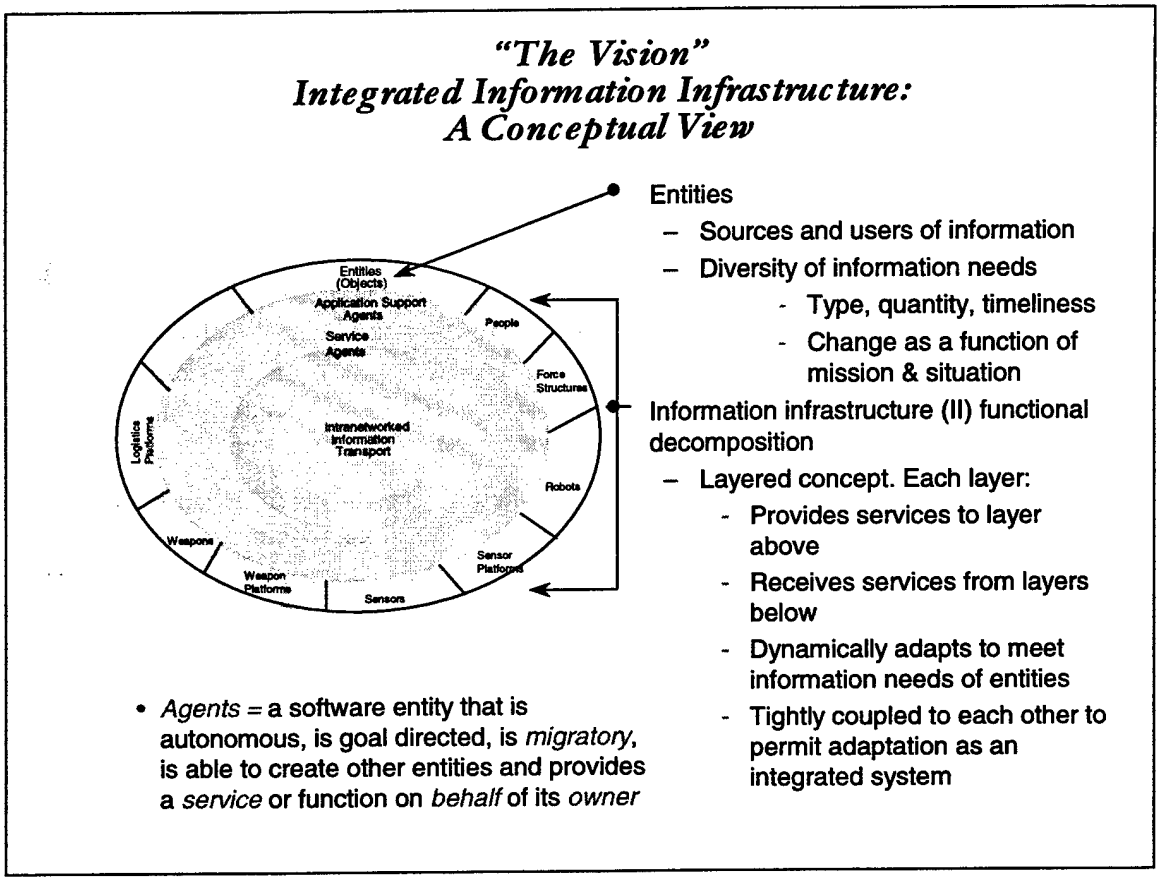

Figure 5. III Vision

In prior DSB studies, a vision, called the Integrated Information Infrastructure (III), was developed for DoD[2]. This vision, as discussed below, has become the foundation within DoD for many of its information infrastructure initiatives today. The vision sets goals and directions for DoD-wide information services that will come about through the exploitation of private sector information technology (IT), to include associated IA technologies. The III then sets both a long-term vision and a road map for the evolution of the DoD infrastructure. Figure 5 provides a conceptual view of the III.

The ability to achieve information superiority is the pacing item in realizing the goals of Joint Vision 2020. The inadequacies of current service information infrastructures prevent commanders from realizing the full benefit of the current family of intelligence, surveillance, and reconnaissance (ISR) systems – space-based, airborne, or surface – much less profiting from advances in sensors and weapons. Because of uncertainties whether crucial information will be available when needed, commanders are driven to develop unique, local-only reconnaissance,

[2] Reference 1996 DSB Study "Tactics and Technology for 21st Century Military Superiority"; 1998 DSB Summer Study "Joint Operations Superiority in the 21st Century"; 1999 DSB Summer Study "21st Century Defense Technology Strategies"

surveillance, and target acquisitions (RSTA) systems. Overall, this tendency has resulted in redundant investment in, and proliferation of, "stovepipe[3]" communication and sensor systems.

Increasingly, the armed forces are shifting to an operational concept wherein surveillance and targeting sensors are separated physically from the command node location, which in turn may be remote from the weapons launch platform. In the case of air platforms, for example, no longer will the sensors, commander (pilot), and weapons necessarily be collocated in a single aircraft. Further, third party targeting data sources and weapons magazines are proliferating. Examples of this evolving trend appear in such concepts as forward pass, cooperative engagement capabilities (CEC), the arsenal ship, and the transfer of tactical situation data derived from a variety of off-board sources directly into cockpits.

This evolution promises major improvements in the tactical flexibility and combat effectiveness of forces. The realization of this promise is not without challenges, however, because the operational concept is inhibited by the inadequacy of the traditional military communication and information-services infrastructure as well as continuing interoperability problems between military services and between systems within a given service.

To realize the potential benefit of this new concept, our future information infrastructure must be capable of reliable transmission, storage, retrieval and management of large amounts of data. Today all systems are segmented into communications links, computers, and sensors that in turn are stovepiped to support specific functions (i.e., intelligence, logistics, and fire control). Furthermore, these component entities are now constrained by a lack of (1) the bandwidth necessary for high-resolution imagery transfer; (2) the processor capacity needed for target recognition and interpretation; (3) memory sufficient to handle massive amounts of archival data; and (4) software to search the many data repositories quickly in order to provide commanders with tactical information in a timely manner. These constraints are magnified by difficulties in integrating a myriad of legacy information systems with newly developed, service-unique stovepipe and joint systems. These limitations can be overcome, and the full capability of joint forces realized, if we set as our goal the integration of all military C4ISR[4] systems into a ubiquitous, flexible, interoperable C4ISR system of systems – the Integrated Information Infrastructure.

The Integrated Information Infrastructure must meet several key requirements if it is to enable future combat operations to support a wide spectrum of missions, threats, and environments.

As stated in Joint Vision 2020, a military force must be able to receive or transmit all of the information it needs for the successful and efficient prosecution of its mission, from any point on the globe, in a flexible, adaptive, reconfigurable structure capable of rapidly adapting to changing operational and tactical environments. The information infrastructure must support this need, while allowing force structures of arbitrary composition to be rapidly formed and fielded. Furthermore, the infrastructure must adapt to unanticipated demands during crises, and to stress imposed by adversaries.

---

[3] "Stovepipe" systems are those designed with one application or uses in mind without consideration of interfaces with other systems.

[4] C4ISR: Command, control, communications, computers, and intelligence surveillance and reconnaissance.

The infrastructure must allow information to be distributed to and from any source or user of information at any time: its architecture must not be constrained to support a force-structure (enterprise) hierarchy conceived *a priori*. Most importantly, the information and services provided to an end user through the infrastructure *must be tailored to the user's needs, and be relevant to the user's mission, without requiring the user to sort through volumes of data or images*.

The information infrastructure must include multimode data transport including landline, radio, and space-based elements. All of these media must be integrated into a ubiquitous, store-and-forward data internetwork that dynamically routes information from source(s) to destination(s), transparently to the user. This data transport segment of the infrastructure must be self-managed, be adaptive to node or link failure, and provide services to its users based on quality-of-service (QoS) requests. These services include bandwidth, latency, reliability, precedence, distribution mechanisms (point to point, point to multipoint), and the like.

The infrastructure interface will link the user to a distributed processing environment that includes all types of computers situated at locations appropriate to their needs for power, environment, and space. This distributed computing environment will be integrated via the transport component of the infrastructure, thus enabling these processors to exchange data dynamically, share computation loads, and cooperatively process information on behalf of and transparent to the user.

The infrastructure should be an adaptive entity that integrates communication systems, computers, and information management resources into an intelligent system of systems. Each component of the III will exchange state information with each other, in order to enable the entire infrastructure to adapt to user requirements and any stresses imposed on the network by an adversary. This adaptability will also enable the infrastructure to change its scale as necessary to support force structure(s) of arbitrary size, or to incorporate new processing, network, and communication technologies as they are developed. Thus, this infrastructure is a scaleable computing environment.

The information infrastructure must provide tailored information services to diverse users ranging from a single person to a collection of people, sensors, and/or weapons by means of intelligent agents – software entities, under the general control of the user, that are goal-directed, migratory, and able to create other software entities, and provide services or functions on behalf of the user.

Each user will be served by one or more intelligent software agents that *proactively* provide and disseminate appropriately packaged information. These agents will perform such functions as fusing and filtering information and delivering *the right information to the right user at the right time*. They must be proactive in the sense that they are aware of the user's situation and needs, and can provide information relevant to those needs without a specific user request.

These agents will multiply the personnel resources available to combat units by gathering and transforming data into actionable information to support unit operations, just as unit members would have to do, were the software agents not provided. Warfighters will therefore be freed of routine chores in favor of actual operations.

Page 880 of 3957

To the maximum extent feasible, the infrastructure's transport layer will take advantage of commercial technology and networks, by utilizing open-systems standards and protocols, and will minimize the use of service- or function-unique hardware and software. For applications where military-unique capabilities (such as antijam, low probability of intercept, spread-spectrum waveforms and the like) are required, military products will be developed or adapted to interface with the overall architecture.

We must set as a goal the realization of the III vision in an evolutionary manner. As we succeed, we will enable, over time, the following military capabilities:

- Geographic separation and functional integration of command, targeting, weapons delivery, and support functions
- Support for split-base operations, force projection, information reach back, combat, and force protection for units large and small
- Common situational understanding, common operating picture, and informed and rapid decision making for joint forces
- Enhanced operational flexibility for commanders at all levels
- Reduced logistics footprints in immediate combat areas
- Full exploitation of sensor, weapon, platform and processing capabilities
- Real-time or near real-time responsiveness to commanders' requests for information, fire support, and urgent logistics support

The first phase for realizing the III is the implementation of the Global Information Grid (GIG). The GIG will incorporate near-term information technologies to provide the warfighting capabilities noted above. The GIG will, over time, evolve into the longer-term vision for the III. As we proceed to implement and secure the GIG, we must keep the evolution toward the III in mind.

Page 881 of 3957

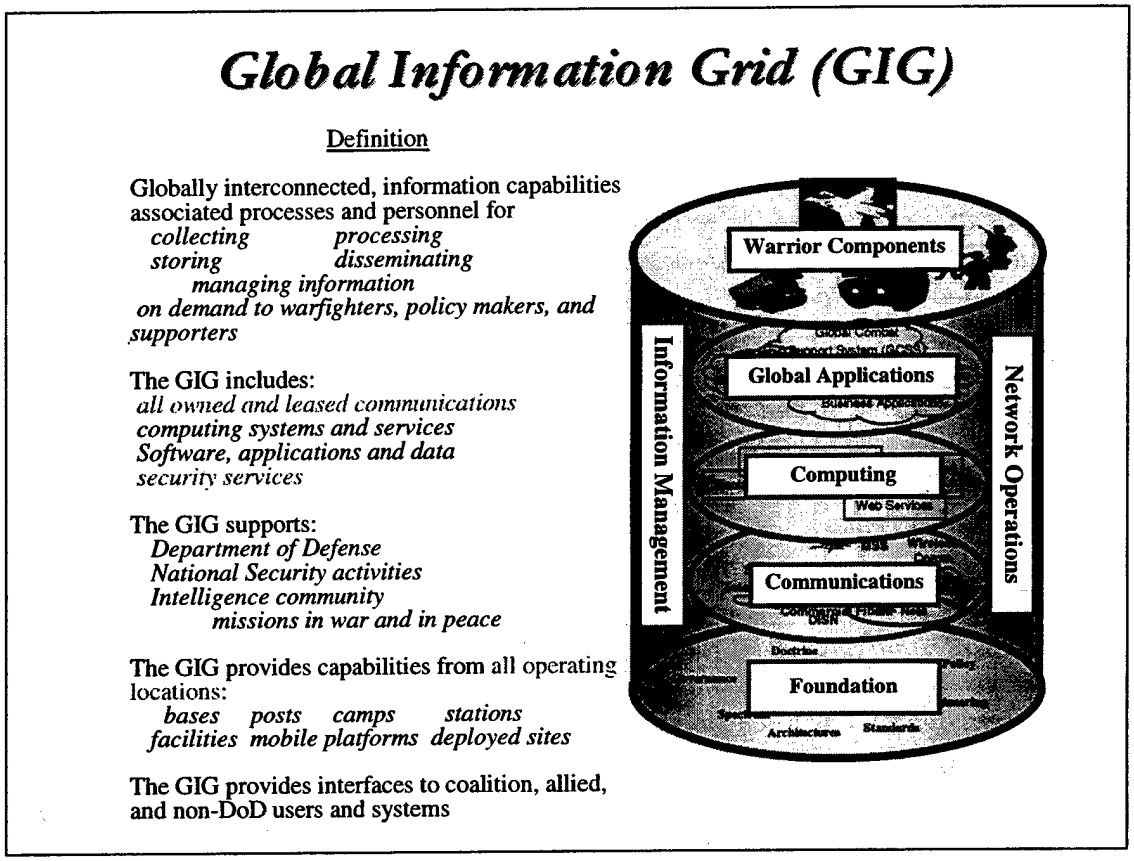

Figure 6. Global Information Grid

The III vision was formulated in 1996. It, along with similar visions such as Network Centric Warfare (NCW) and the Advanced Battlefield Information System (ABIS), has helped DoD formulate and articulate a vision for a near-term version of the III. This near-term vision is shown in Figure 6. The GIG is intended to be the means by which information superiority (IS), as envisioned in the Joint Vision 2020, is achieved. The following quotes define the GIG.

> *The GIG is the vision of the Assistant Secretary of Defense for Command, Control, Communications, Computers, and Intelligence (ASD/C3I) for achieving IS. The GIG is focused on the warfighters' needs for IS plus the critical concerns of frequency spectrum and improving the management of the information infrastructure investment along with the coevolution of Doctrine, Organization, Training and Education, Materiel, Leadership, Personnel, and Facilities (DOTMLPF).* [5]

The September 22, 1999, Office of the Assistant Secretary of Defense Director, Command, Control Communications and Intelligence Systems (ASD/C3I) memorandum, Subj: Global Information Grid, defines the Global Information Grid (GIG) as:

---

[5] Reference: *Enabling the Joint Vision*, The Joint Staff, C4 Systems Directorate, Information Superiority Division (J6Q), Pentagon, Washington, D.C., March 2000

The globally interconnected, end-to-end set information capabilities, associated processes and personnel for collecting, processing, sorting, disseminating and managing information on demand to warfighters, policy makers, and support personnel. The GIG includes all owned and leased communications and computing systems and services, software (including applications), data, security services and other associated services necessary to achieve Information Superiority. It also includes National Security Systems as defined in section 5142 of the Clinger-Cohen Act of 1996. The GIG supports all Department of Defense, National Security, and related Intelligence Community missions and functions (strategic, operational, tactical and business), in war and in peace. The GIG provides capabilities from all operations locations (bases, posts, camps, stations, facilities, mobile platforms and deployed sites). GIG provides interfaces to coalition, allied, and non-DoD users and systems.

The GIG's interoperability builds upon the existing Defense Information Infrastructure (DII) Common Operating Environment (DII-COE). The building blocks of Joint Technical Architecture, Joint Operational Architecture, Joint Systems Architecture, a shared data environment, the migration of legacy systems, and adherence to commercial standards provide the necessary structure for the GIG.

The key to achieving information superiority lies in implementing *a standards based, metric-oriented*, end-to-end integrated Global Information Grid. The concept of IS may be situational but the GIG, which will implement IS, is quantifiable. Important initiatives to implement the GIG are described in the following sections.

The emphasis on the standards-based and metrics-oriented aspect of the GIG description is believed by the panel to be key to its being successfully deployed, used and evolved to continuously meet DoD needs.

Page 883 of 3957

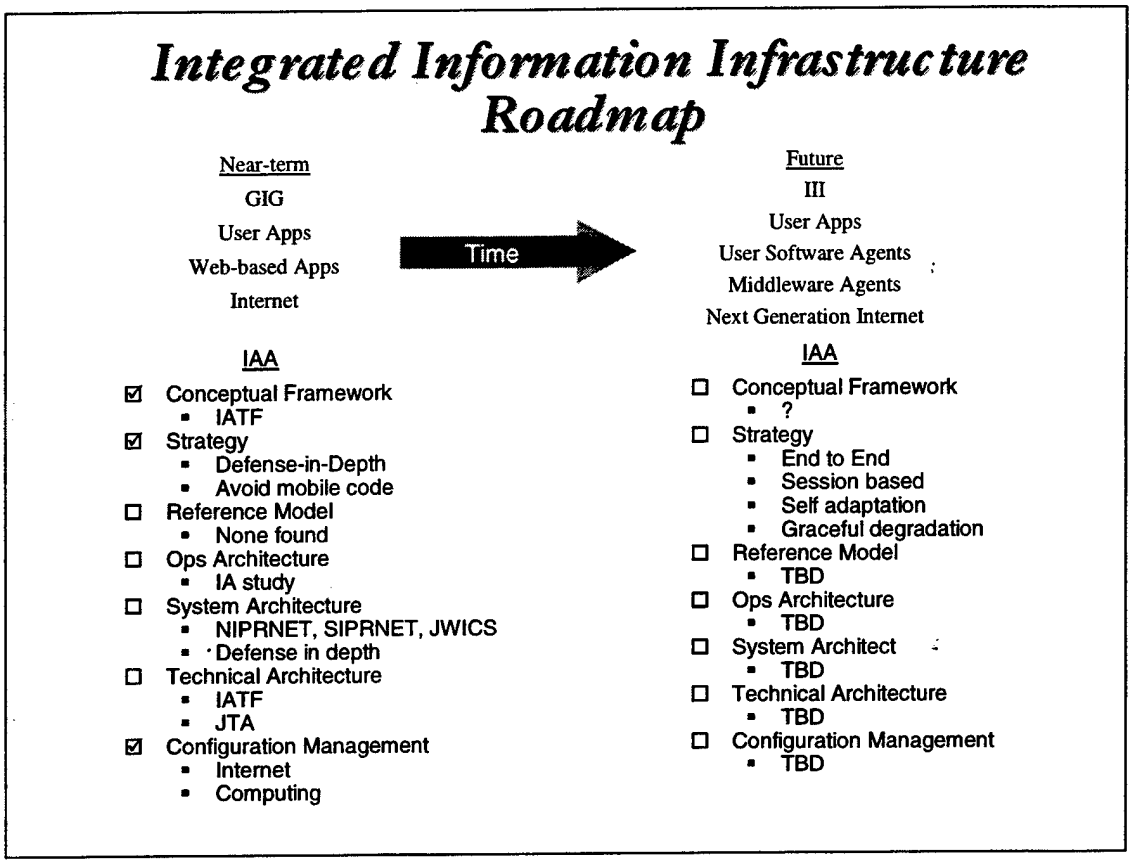

Figure 7. III Roadmap

The evolution of today's GIG into the III envisioned by the DSB requires that the GIG exploit technologies, standards and architectural frameworks based on information technologies (IT). It is within the private sector that significant investment in and rapid evolution of IT is occurring. DoD must position its evolving GIG to take advantage of this technological evolution.

Figure 7 shows the evolution of the GIG. As noted, its foundation architectural framework must be sufficiently flexible to allow transition from more conventional relational/procedural-based information services to services supported by intelligent mobile code (software agents). Keeping this evolution in focus today will help DoD augment the GIG when necessary as well as help to guide DoD's science and technology (S&T) investments over the next several years.

Page 884 of 3957

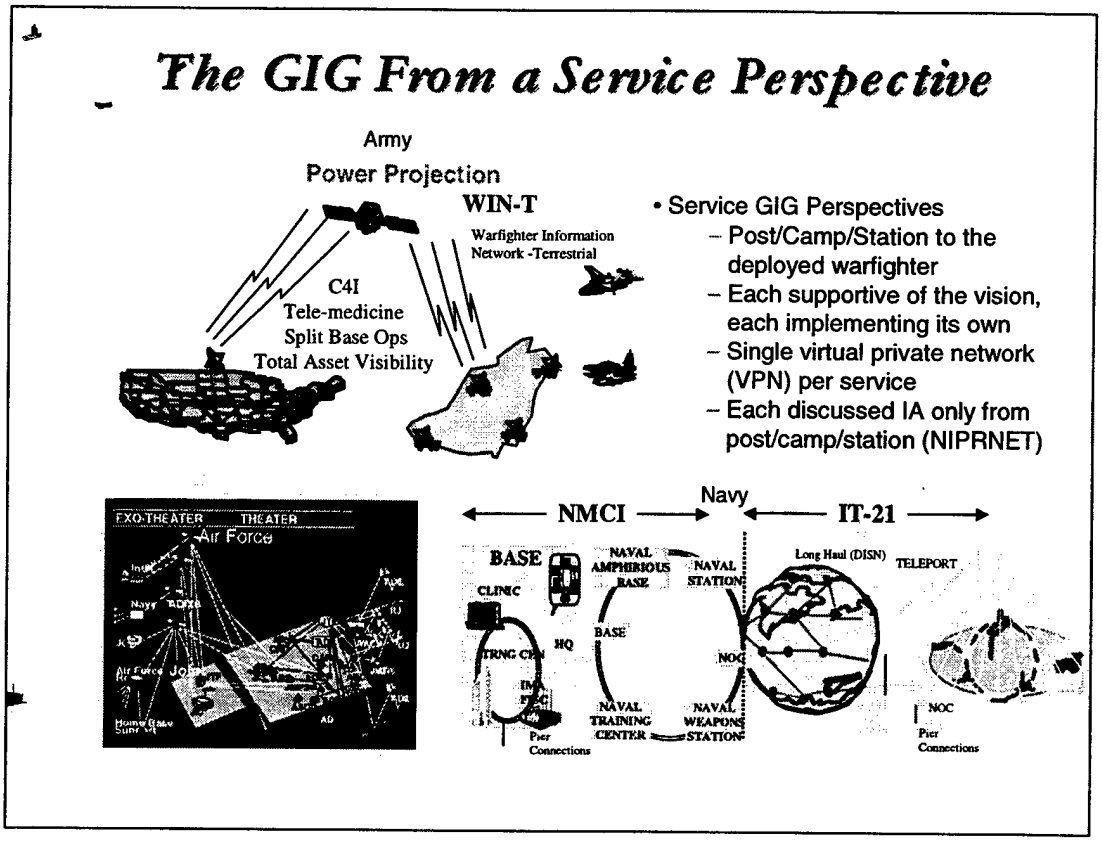

Figure 8. The GIG from a Service Perspective

In addition to hearing the OSD perspective, plans, and strategy for the GIG, the panel heard the service views on GIG. In each case, as shown in Figure 8, the Services presented an overview of the GIG that was consistent with the notion of an integrated infrastructure connecting post, camp, or station to deployed forces. The infrastructure, from each service's perspective, would support warfighter applications, combat service functions, and business functions for each of its user communities wherever they are situated.

The panel noted, though, that each service presented and talked to *its* implementation of a global information grid – none presented a concept of a single, joint, DoD-wide GIG which would be leveraged and used for its information needs. The panel did not hear how the services' need for various levels of security (unclassified through top secret) would be supported in their respective implementations. In fact, the panel noted that the primary focus of the Services' presentations was supporting post/camp/station unclassified information services. The panel also heard that each service anticipated having wireless access media integrated into its respective segment of the GIG. This wireless media is necessary to support our highly mobile, forward-deployed forces. In addition, the panel noted that wireless point-to-point extensions exist in the "wire-based" (fiber or copper) segments of the GIG that support the interconnection of the post/camp/station locations. These wireless media need to be considered when one addresses IAA for the GIG. This issue, not discussed in DoD briefings, is addressed more fully in subsequent sections of this report.

Page 885 of 3957

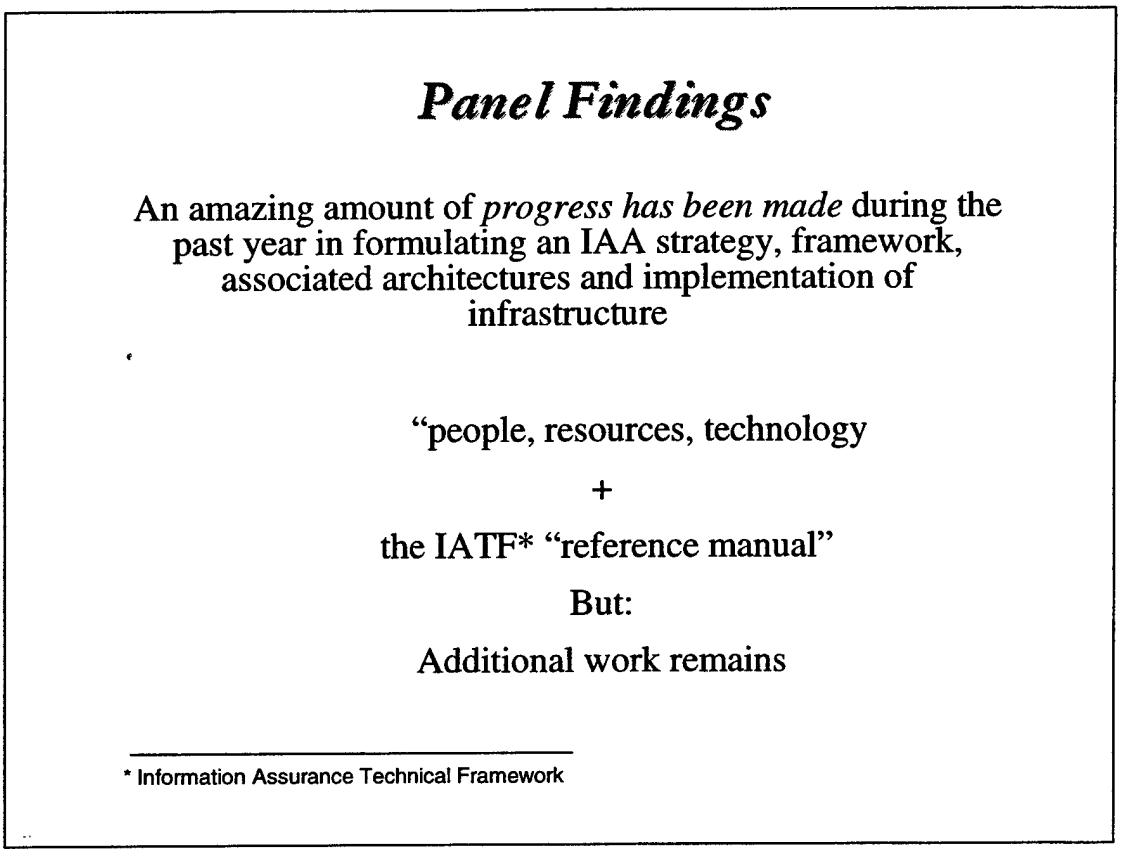

Figure 9. Panel Findings

From the DoD and service-related briefings, the panel noted that significant progress has been made in formulating an IAA strategy, framework, and associated architecture and in implementing infrastructure. The IAA Panel noted that significant people, funds and technology have been allocated and deployed toward providing a more robust DoD information infrastructure. This section of our report presents the panel's findings related to this progress.

Page 887 of 3957

CHAPTER 3. IAA FRAMEWORK

3.1 IAA REFERENCE MODEL

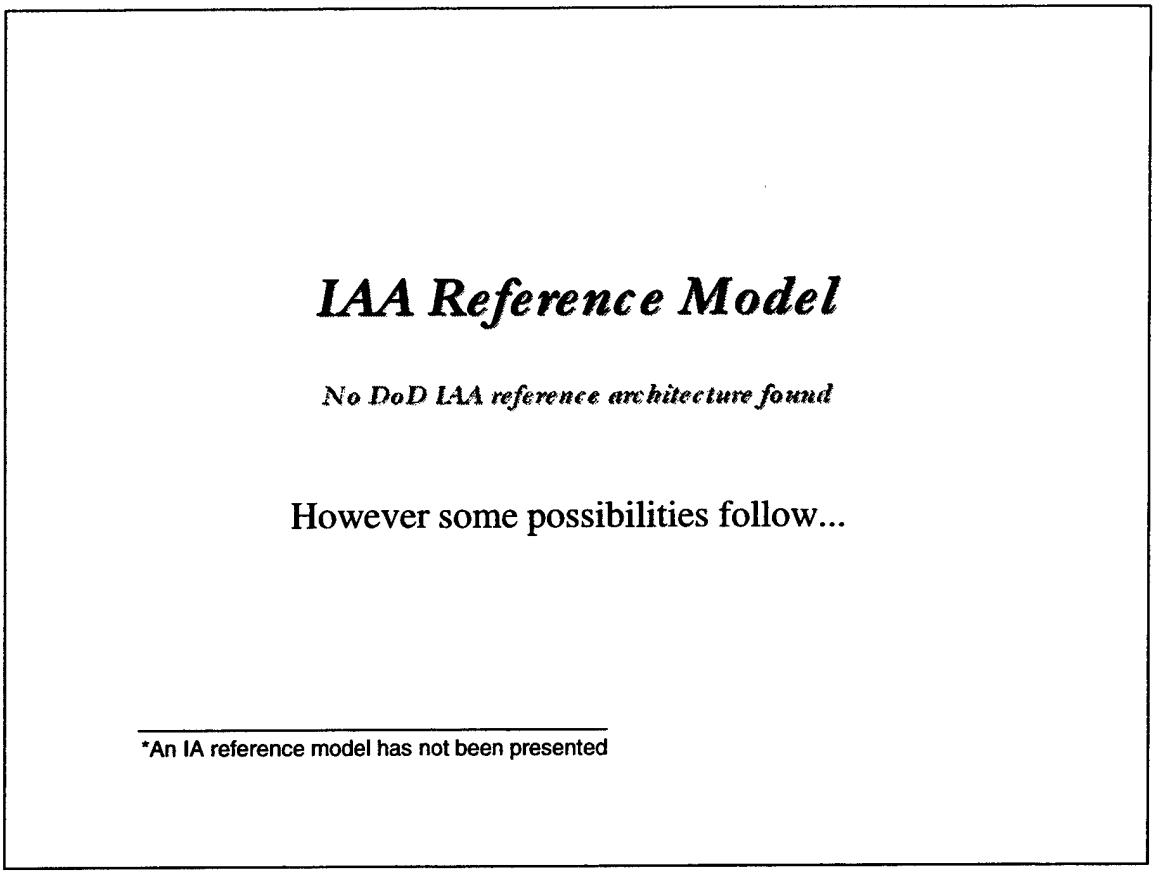

Figure 10. IAA Reference Model

As shown in Figure 10, no single IAA reference model (RM) has been selected or developed by DoD. Such a reference model would help the DoD IA community understand where appropriate IA standards and services are provided within the GIG. Given that a RM has not been selected, the panel noted that various options do exist.

Page 888 of 3957

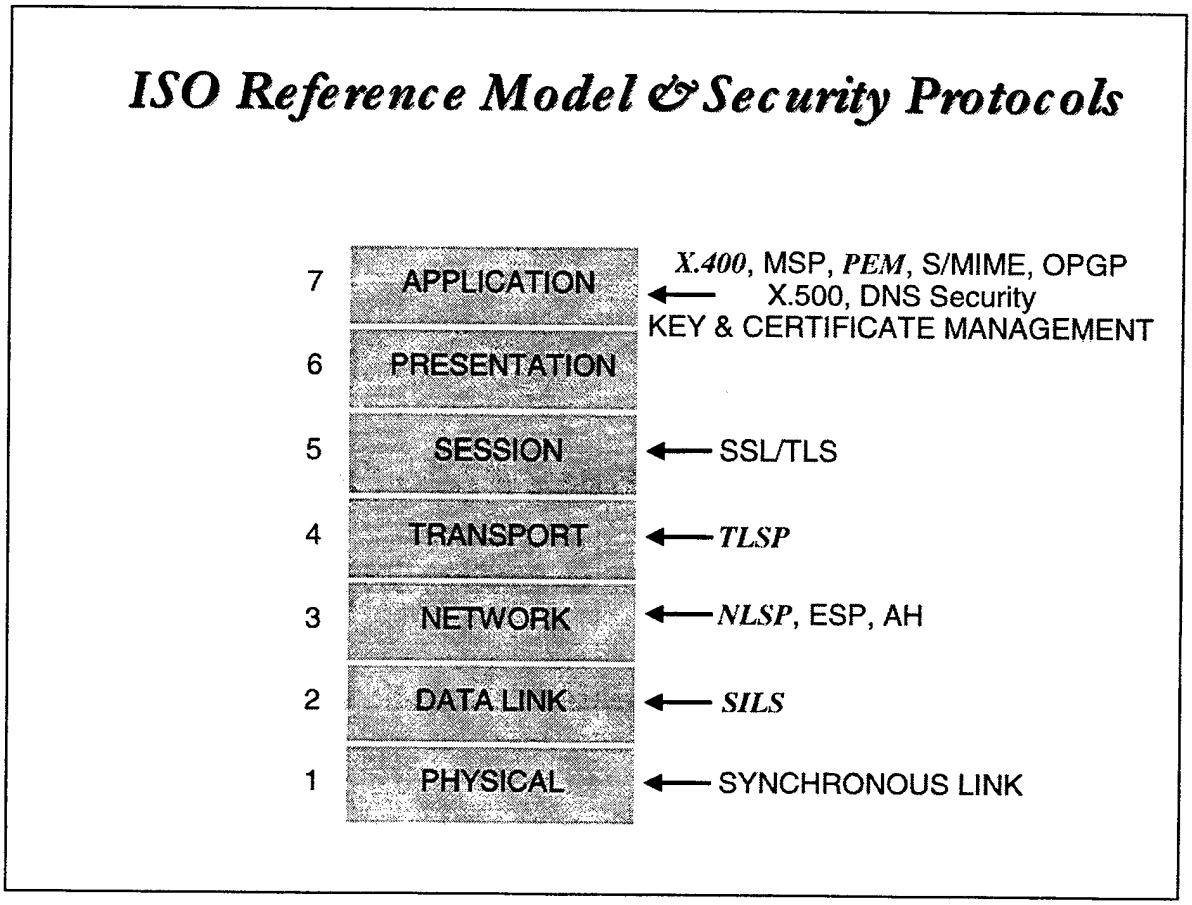

Figure 11. ISO Reference Model and Security Protocols

Figure 11 presents one option. This figure illustrates the International Organization of Standardization (ISO) reference model (ISO 7498) annotated with a mix of International Telecommunications Union (ITU-T) (see ISO and Consultive Committee on International Telegraph and Telephone [CCITT]) and Internet Engineering Task Force (IETF) security protocol standards. (The term "synchronous link encryption" is non-standard and refers to physical layer cryptographic devices employed on a per-link basis. The term "key and certificate management protocols" is also non-standard.) The standards highlighted in *italics* are obsolete, either superceded by newer standards or never adopted by vendors and integrated into products.

The protocols noted in Figure 11 include:

- Standard for Interoperable LAN Security (SILS), Institute of Electrical and Electronics Engineers (IEEE) 802.10
- Network Layer Security Protocol (NLSP), an ISO protocol
- Encapsulating Security Payload (ESP) and Authentication Header (AH), Internet Engineering Task Force (IETF) protocols defined in RFCs 2402 and 2406
- Transport Layer Security Protocol (TLSP), an ISO protocol

- Secure Sockets Layer (SSL)/ Transport Layer Security (TLS); the former is a commercial security protocol, the latter is the IETF version
- X.400, Message Security Protocol (MSP), Privacy Enhanced Mail (PEM) Secure MIME (S/MIME) and Open PGP (OPGP), all are secure e-mail protocols. X.400 is a CCITT standard, MSP is a DoD standard, and PEM, S/MIME and OPGP are IETF standards
- X.500 and DNS Security are directory security standards from the CCITT and IETF, respectively

ISO Reference Model:

Mapping Services to Protocol Layers

Selective Field Integrity	•	•	•	•	•	•	Y
Non-repudiation, Origin	•	•	•	•	•	•	Y
Non-repudiation, Receipt	•	•	•	•	•	•	Y

Figure 12. ISO Reference Model

Figure 12 illustrates the mapping of security services (as defined in ISO 7498-2) to the seven layers of the ISO reference model shown in Figure 11. It is extracted from a more comprehensive larger table in ISO 7498-2. The table is intended as a guide for protocol developers, suggesting which security services may be appropriate to offer at which layers. Even without examining each cell in detail, several issues are apparent. The question marks at layer 2 represent a disagreement between ISO and IEEE, which was eventually resolved in favor of the IEEE (re SILS). Layers 3 & 4 offer similar security features. No security services are recommended for the

session layer (5), and little is appropriate for layer 6. Any security service can be offered at layer 7.

Note that the same service may be offered at multiple layers without being redundant, because different layers provide different communication services. So, for example, excellent traffic flow confidentiality can be offered at layer 1, but end-to-end confidentiality requires use of layer 3, 4 or 7.

In the IA reference model recommended by the panel, we propose adoption of standard security protocols at layers 3, 5, and 7. We also emphasize the use of layer 1 (physical layer) security technology (i.e., link encryption or Transmission Security [TRANSEC] for wireless links) to connect DoD network elements.

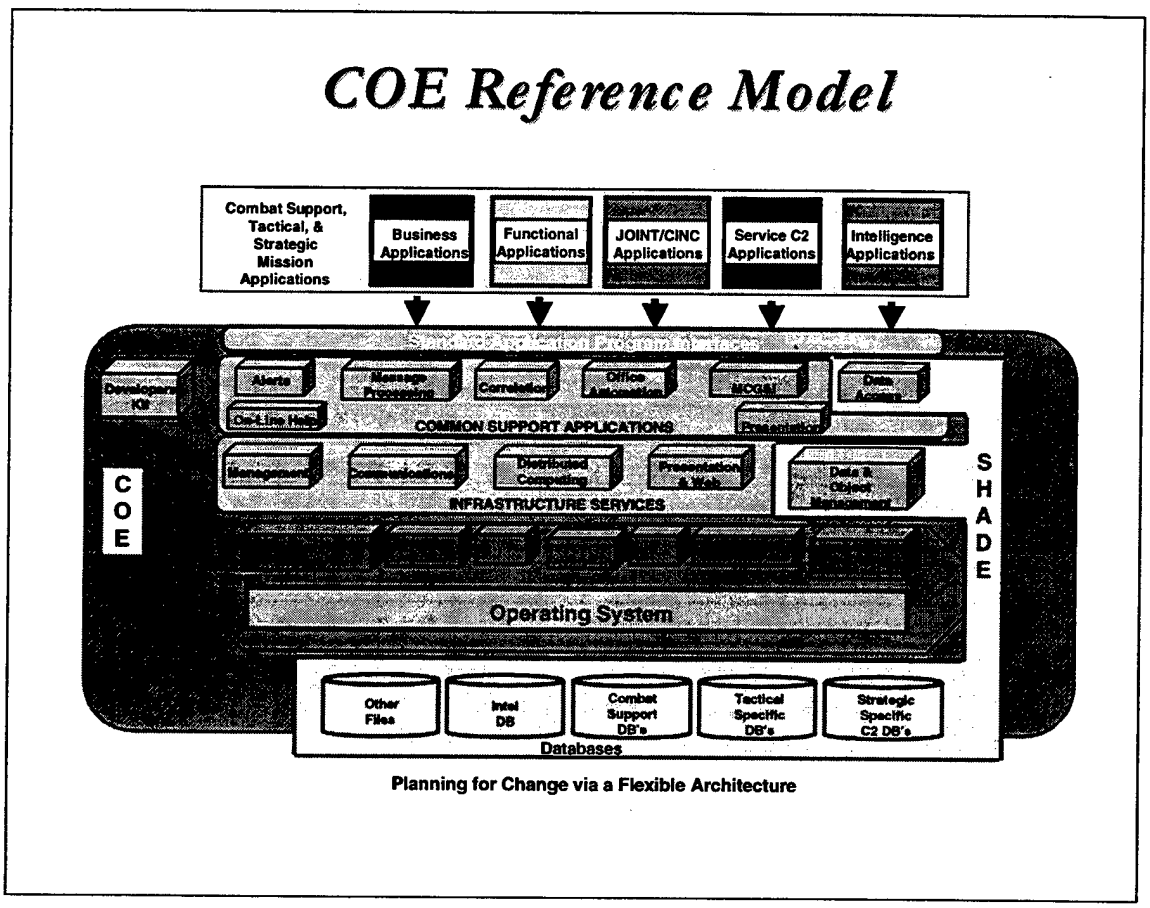

Figure 13. COE Reference Model

A second option for a GIG RM is extending the Common Operating Environment RM (COE) shown in Figure 13. This reference model illustrates the segmentation and layering of code and services in the COE. The panel noted, however, that the COE does not yet address IA (security) services within either its RM or within the run time environments or segmented code libraries it provides to DoD customers. Through discussions with DoD COE representatives, the panel learned that IA extensions to the COE RM, to identify IA services, are presently underway, but there are no near-term plans to add IA (security) code to the COE run time environments. The

panel also noted that the COE is a product-centric framework as opposed to a standards-centric framework that is one of the underlying tenets of the GIG (see discussion in Figure 6).

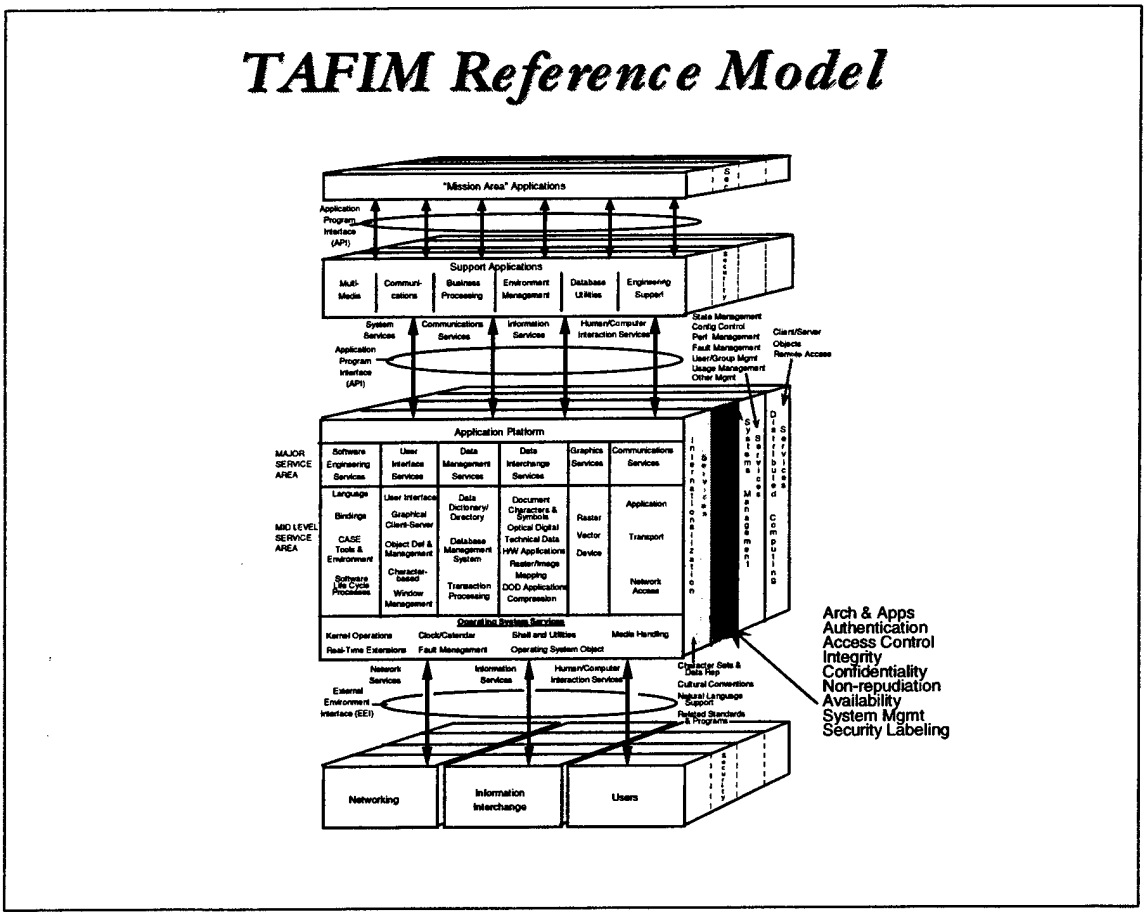

Figure 14. TAFIM Reference Model

A third possible IA reference model is shown in Figure 14. This model comes from an earlier DoD initiative to establish a vision and framework for information systems and services within the Department. This earlier effort, called the Technical Architecture for Information Management (TAFIM), attempted to compile industry and DoD standards, practices and architectures associated with enterprise-scale, distributed, information systems. In this reference model, security services are identified as a backplane of the application platform. The security services provided to the "mission-area" applications include: authentication, access control, integrity, non-repudiation, availability, system management, and security labeling.

The TAFIM RM did not provide sufficient information to allow system implementers to select a specific set of protocols to provide IA services for their users. Because of its lack of specificity the TAFIM has been replaced with more current and focused technical guidance documents (i.e., the Joint Technical Architecture – [JTA]) and run time environments (i.e., the COE).

Page 892 of 3957

Of the three possible IA RMs presented, the panel suggests that DoD select the Open Systems Interconnect (OSI) framework. In the section of this report entitled "what can be done," (see Section 4) the rationale for this suggestion is presented.

3.2 SYSTEM ARCHITECTURE

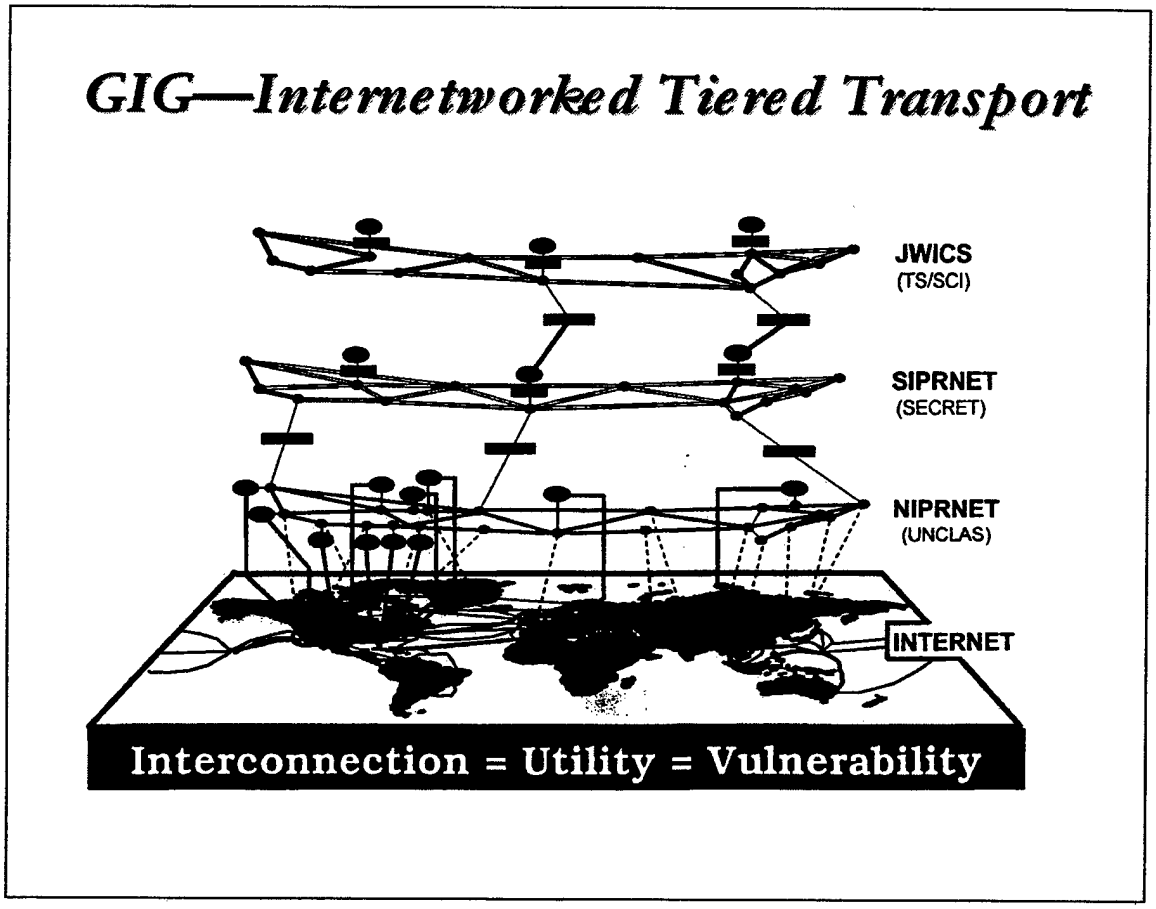

Figure 15. GIG—Internetworked Tiered Transport

As shown in Figure 15, the system architecture for the telecommunications component of the GIG, as it exists today, comprises three virtual, worldwide data networks. These networks include the non-secure Internet Protocol (IP) network (NIPRNET), the secret IP network (SIPRNET), and the Joint World-Wide Intelligence Communication System (JWICS). The NIPRNET, which supports unclassified (but possibly sensitive) DoD data communications, has been part of the private sector World Wide Web (WWW). It is accessible, in principle, by all WWW users and is connected to the packet-switched routing infrastructure (the public Internet) that underlies the WWW. Interconnection points between DoD NIPRNET systems (host, routers, and access points) and the public Internet have been many hundred and mostly unmanaged by DoD.

Recently, DoD has decided to limit these access points to 8 to 11 monitored gateways between a virtual NIPRNET and the public Internet. Additional connection points could be allowed but are planned, at present, to be few in number and carefully controlled by DoD.

The SIPRNET is a secret-high virtual private DoD network. This system uses encrypted links between the routers that connect user sites, to secure transmission of secret data. User sites, and their corresponding competing resources, are all run at secret high. The panel notes that the SIPRNET traffic can (and probably does) transit the same physical transmission links (fiber, copper, and wireless systems) as does NIPRNET traffic – the former being encrypted, the latter being transferred primarily in the clear.

JWICS is also a virtual private network supporting the exchange of Top Secret (TS), Sensitive Compartmented Information (SCI) between user sites. JWICS, similar to SIPRNET, appropriately encrypts information for transmission over the communication links that connect the routers at each user site and transfers this data across the same commercial (and government-owned) transmission facilities used by the NIPRNET. Thus, JWICS, SIPRNET, and NIPRNET are cryptographically segmented virtual private networks (VPNs) that likely share common physical communication media. In the current system, these VPNs are implemented at the physical layer, which offers good security in many respects. Somewhat different features arise if one also creates VPNs at the IP layer, as we discuss later.

The panel was also informed that traffic can flow between JWICS and SIPRNET and between SIPRNET and the NIPRNET via trusted guards. These guards automatically filter the type and quantity of data that flows between these virtual networks. Their use is a risk/benefits tradeoff that has placed user and enterprise value on allowing limited traffic flow of appropriately sanitized information between virtual networks of different classification levels while accepting the risk of having unfiltered information pass the network boundaries or possibly opening covert channels of information flow from the classified to the unclassified communities (possibly by virtue of an insider threat).

Another key aspect of the system architecture suggested by Figure 15 is that all DoD general information resources are on the NIPRNET. Thus, private sector users needing access to this general, public information are required to gain access to the DoD computer servers storing this information. Although DoD has had issues with hackers and malicious entities trying to deface or gain access to their Web sites, the present plan is still to filter access to these sites – yet everyone must still be granted access to this general information at many DoD sites maintaining this information. The DoD is aggressively deploying a defense-in-depth strategy, as discussed in the next figure, but it must still provide and support access to all NIPRNET DoD sites for the general public and those elements of the private sector with which DoD conducts e-commerce. This planned approach makes it harder to design and deploy an effective defense-in-depth approach.

The panel also noted that the GIG is really, today, the aggregation of the JWICS, SIPRNET and NIPRNET virtual private networks. These networks, together, constitute the starting point for the GIG. Consequently, one should think of the SIPRNET as the VPN that provides (secret level) secure data/information transfer from post/camp/station to the "foxhole." Thus, all service secret-level combat mission functions and their supporting computers and communications should be viewed as being integrated into the SIPRNET. Similarly, the NIPRNET VPN should be viewed as the network supporting unclassified but sensitive (UBS) combat information services such as in-the-field logistics and medical and troop deployment/movement. If this perspective is taken, a means of more fully protecting the NIPRNET is required. A suggested architecture will be provided in the section of this report entitled "What Might Be."

Page 894 of 3957

Finally, the panel notes that both the SIPRNET and JWICS provide virtually no protection against the insider threat. This issue is also addressed Chapter 4 entitled "What Might Be Done" later in this report.

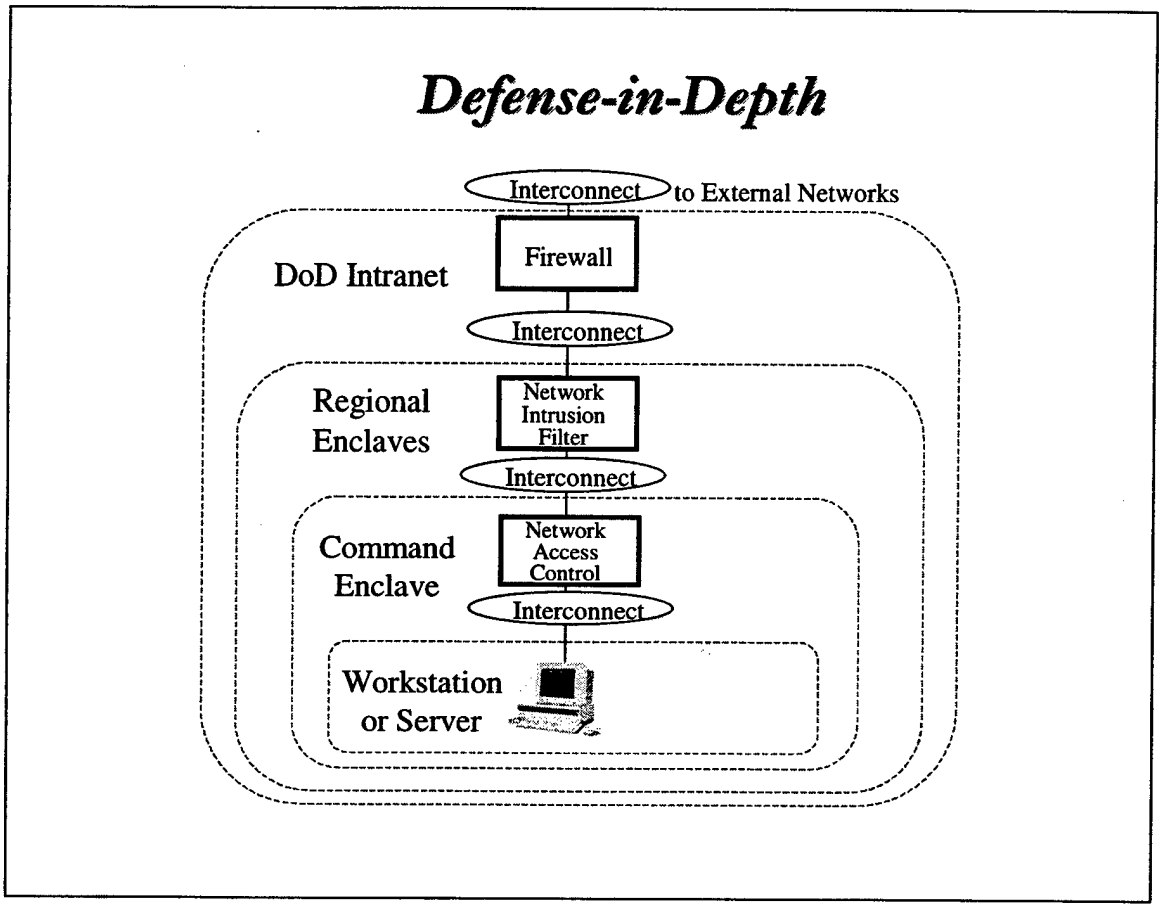

Figure 16. Defense-in-Depth

Figure 16 shows the "defense-in-depth" (DiD) strategy DoD is employing to try to protect its publicly accessed sites on the NIPRNET. The basic concept of defense-in-depth is to provide multiple layers of security mechanisms between computing elements (workstations and servers) in a particular enclave and computing elements in other enclaves, the DoD Intranet, or external networks. There are four focus areas of defense-in-depth: defend the computing environment; defend the enclave boundary; defend the network; and establish supporting infrastructures. Defending the computing environment includes properly configuring operating systems and application software, along with using host-based security services such as anti-virus software, intrusion detection, and public key cryptography. Defending the enclave boundary includes identifying all enclave boundaries, employing firewalls at these boundaries, and detecting intrusion at the enclave-level. Defending the network includes using link encryption for classified networks, firewalls, and intrusion detection. Supporting infrastructures include PKI (public key infrastructure) services and services that support network management, intrusion detection, and intrusion response.

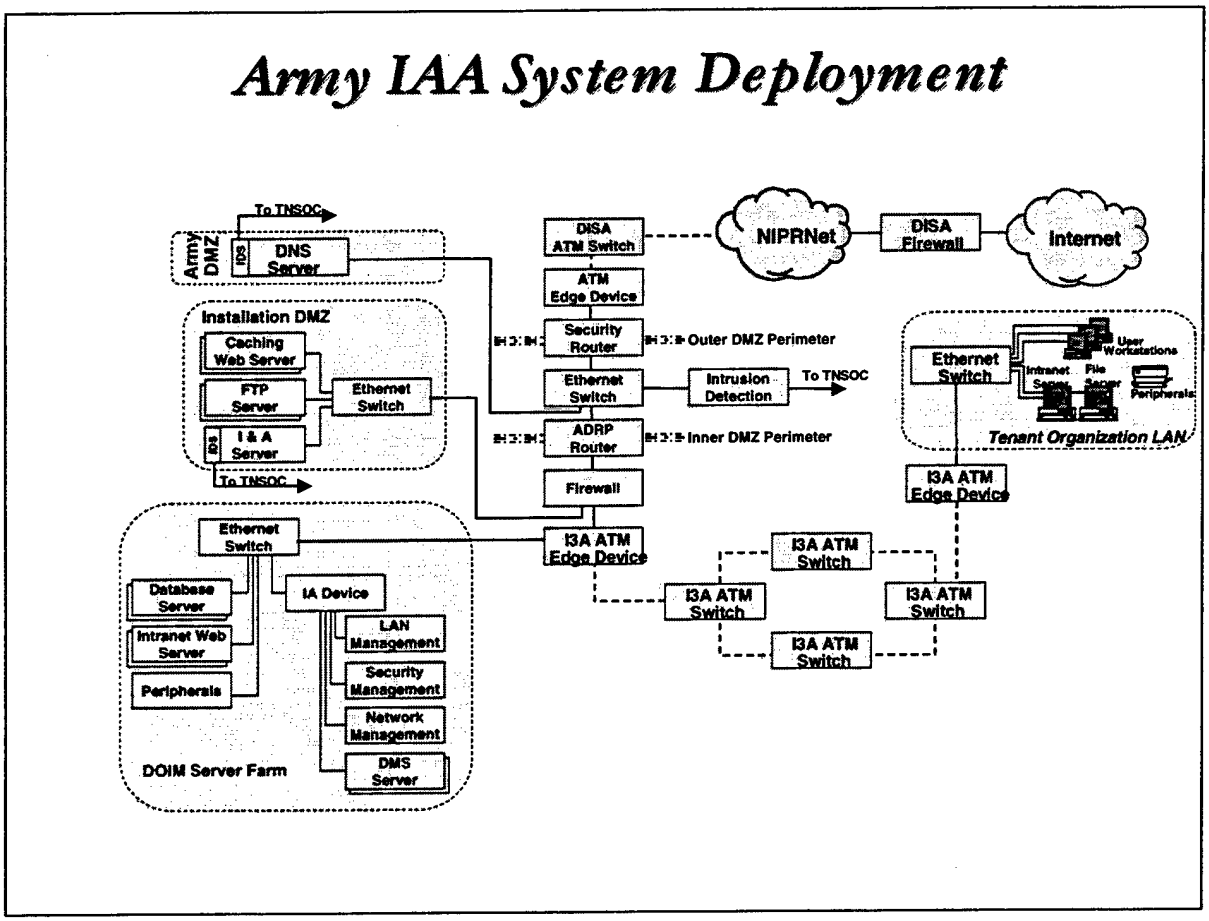

Figure 17. Army IAA System Deployment

The Army is applying a defense-in-depth (DiD) strategy to their NIPRNET post/camp/station enclaves as shown in Figure 17. In this particular system architecture, the Army is accepting that Defense Information Systems Agency (DISA) is providing asynchronous transfer mode (ATM) services to the enclave boundary. A router then provides a translation from the native ATM backbone to an IP-based network interface in the demilitarized zone (DMZ) and to an Ethernet interface within the enclave itself.

In the Army's implementation of DiD, the Army's public information servers are within the installations DMZ. All access from the WWW (public use) comes from the Internet through the NIPRNET, to the installation perimeter, then through the ATM switch, perimeter IP router and an Ethernet switch (at which point intrusion detection is conducted) to the installation servers. Thus *all* public users are funneled to the installation's DMZ for general information services.

In this implementation, there is then an additional IP router, a firewall and an ATM switch to convert from IP back to native ATM. These are then the backbone for the installation server farm and tenant organization's local area networks (LANs). This multiple conversion from ATM to IP to Ethernet to IP to ATM can cause latency and throughput problems (due to multiple protocol translations). This system architecture does provide the opportunity to use higher bandwidth (relative to existing IP network encryptors) ATM network encryptors where necessary. There

does appear to be uncertainty, however, as to why this multiple protocol translation is necessary or desirable.

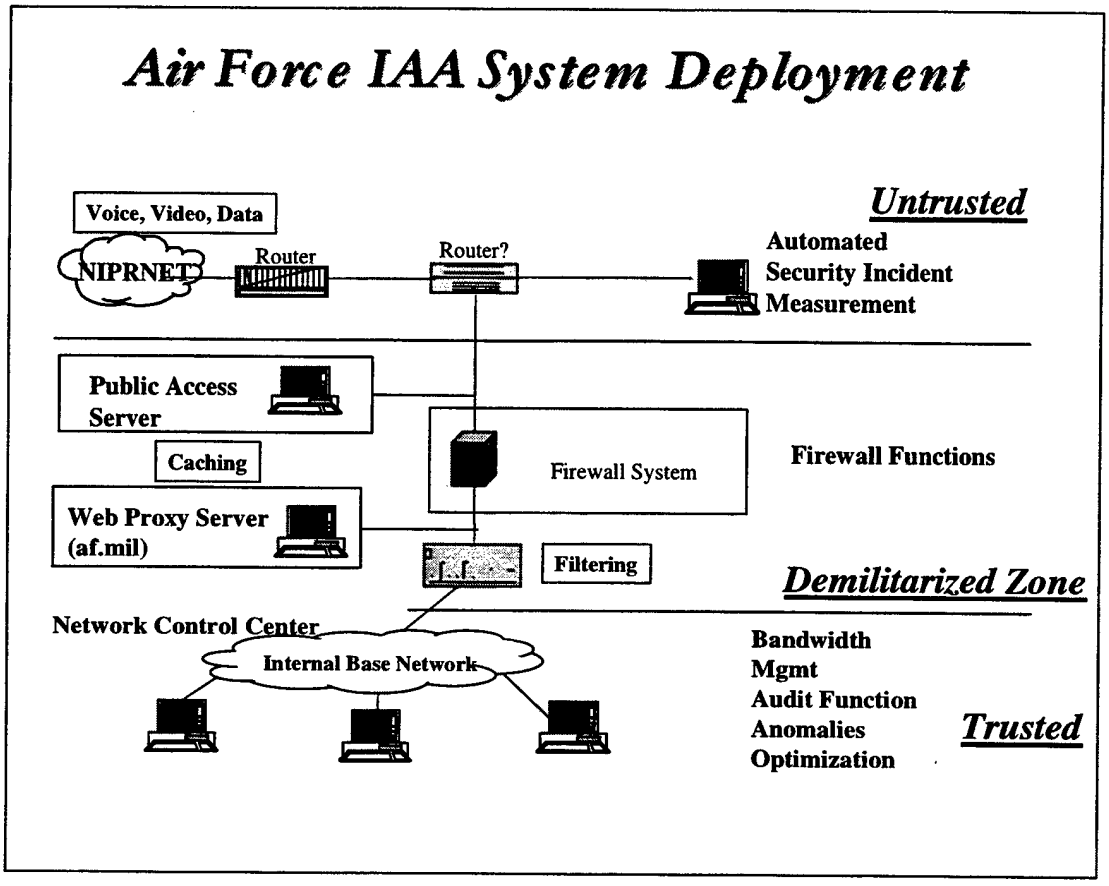

Figure 18. Air Force IAA System Deployment

The Air Force has taken an alternative approach to implementing DiD as compared to the Army. As shown in Figure 18, the Air Force is deploying different protocol translation architecture as well as different locations for performing its enclave-level intrusion detection. Furthermore, the Air Force has combined both firewall and router filtering to provide access control to their enclave infrastructure.

The Air Force implementation is, however, similar to the Army's in that they both invite the general public into their enclave DMZ's for general information services. Thus, the general public is required to transit the NIPRNET for these services; everyone on the WWW is an "insider" on the NIPRNET, with access control being levied only at the installation boundary. Malicious behavior detection for both the Army and the Air Force is conducted at the common access point to the DMZ information services and at the Army/Air Force installation (managed) services. In both cases, the general public can reach this access point as well as the access points associated with the actual installation boundaries.

The Navy's IAA is to be determined (TBD). The Navy has chosen to outsource its GIG/Intranet, including IA services. The Navy does have concepts for how to protect its enclaves, but it has decided to procure IA as an incentivized service in the acquisition. The panel was not able, therefore, to comment on the IA system architecture that the Navy will have. What is evident, however, is that each service is pursuing its own solution to the problem of providing IA for its specific GIG/Intranet component of the DoD NIPRNET VPN. Each service's solution is different and attendant interoperability issues will arise given that all components must be integrated into the NIPRNET. Intrusion Detection System (IDS) information must be readily shared as must information to dynamically set filtering in firewalls and routers given indicators and warnings of information operations against the DoD GIG. Such coordination is especially difficult in the context of diverse defense-in-depth implementation strategies.

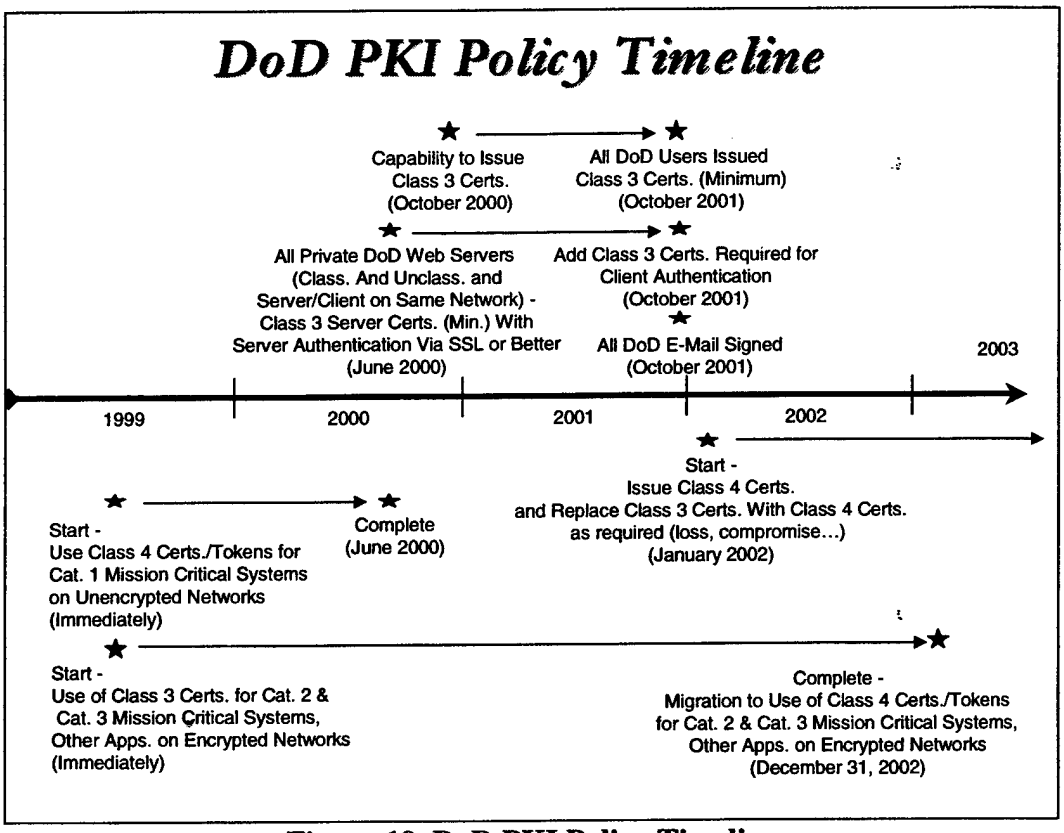

Figure 19. DoD PKI Policy Timeline

An important element of the DoD IAA system architecture is the deployment and use of commercial-based public key infrastructure (PKI). Figure 19 depicts the current DoD PKI policy timeline. This policy applies to all DoD components and provides timelines for the issuance of class 3 and class 4 PKI certificates.

Class 3 certificates are designed to protect administrative, mission support, and some mission-critical information when being transferred within a single security classification level. Class 3 certificates can be issued with a private key contained in a software token. Class 4 certificates protect sensitive but unclassified mission-critical information passing over

unencrypted networks, and the corresponding private keys are intended to be contained in hardware tokens.

The policy establishes timelines for issuing class 3 and 4 certificates to users. It also establishes the timeline for using certificates for web server access control and for email. The timeline shown above has dates that are not aligned with the Common Access Card (CAC) program. The CAC program will provide, via the Defense Enrollment Eligibility Reporting System/Real-time Automated Personnel Identification System (DEERS/RAPIDS), the ability to issue smart cards to DoD personnel that can contain at least class 3 certificates. It is anticipated that class 4 certificates may be able to be issued via the CAC, though this policy was not yet in place at the time of this study. Because the current PKI timeline is not aligned with the CAC timeline, a new PKI policy has been drafted. Though not yet finalized, this policy is expected to move the June 2000 dates to December 2000.

3.3 OPERATIONAL ARCHITECTURE

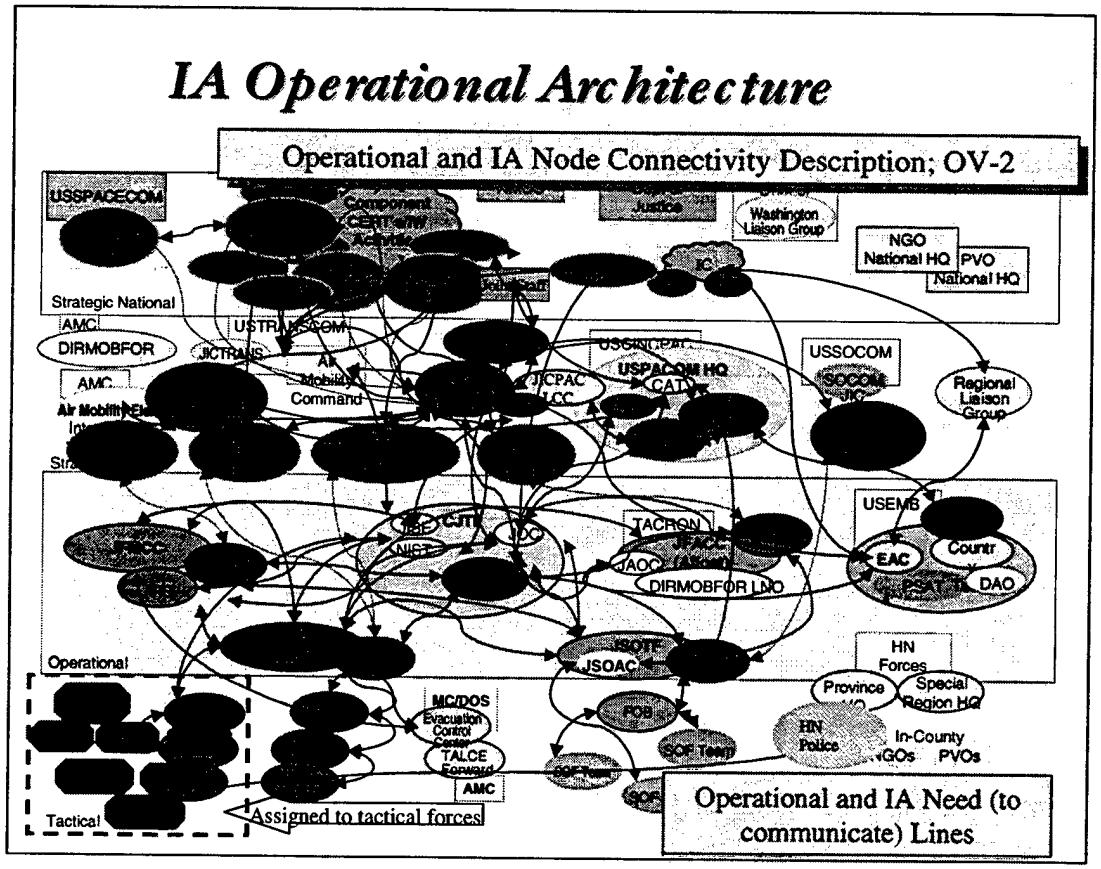

Figure 20. IA Operational Architecture

In addition to the progress made in establishing an IAA system architecture, DoD has begun the process of establishing an IAA operational architecture. Figure 20 depicts one product that has resulted from this effort to date. In this figure, operational facilities (OPFACs) that would be involved in IO processes are identified. The IAA OA has also identified the IA-related

Page 899 of 3957

information exchange requirements (IERs) between these OPFACS that is necessary to coordinate and conduct IA activities. The figure represents a limited non-combatant evacuation operation (NEO), height-of-operation, scenario in the Pacific.

As part of the operational architecture effort, information exchange metrics, activity models, and logical data models are being developed. The panel noted that this IA operational architecture effort is important and will make a critical contribution to understanding IO mission processes, responsibilities, and required information flow for specific concept of operations. Furthermore, this operational architecture will be important in helping to define how IO can/should be process-reengineered to allow for more efficient and timely response to IO missions and threats in the future.

Although establishing an IA operational architecture is a difficult and time-consuming task, the panel feels this effort will provide important insights into the mission, organization and tactics, techniques and procedures (TTPs) required to effectively execute IO. For example, the panel noted that the number of OPFACs associated with the limited scenario represented in Figure 20 implies a substantial IO coordination and information exchange overhead in support of the mission. From such "as-is" operational architecture efforts, "to-be" architectures can be investigated that would simplify the prosecution of IO missions to achieve information superiority as envisioned in JV2020. It is noted, though, that a single IA operational architecture is not sufficient. A representative set of IAA operational architectures for various types of missions and areas of responsibility should be developed in order to more fully understand the entities, processes, and supporting IERs for IA.

Page 900 of 3957

3.4 TECHNICAL ARCHITECTURE

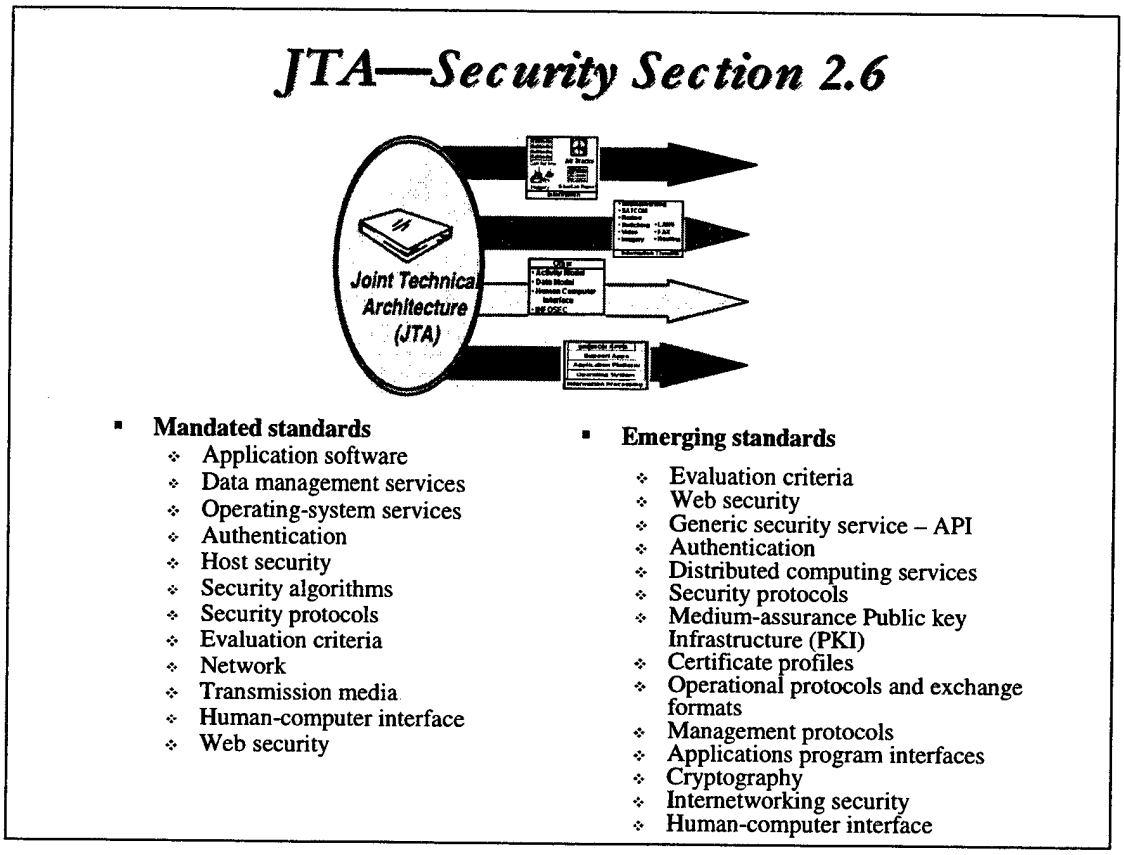

Figure 21. JTA—Security Section 2.6

The remaining component of the IA architectural framework is an associated technical architecture. This latter component is the third element of the DoD C4ISR architectural framework methodology. The set of IA architectural components, IA operational architecture (IA-OA), the IA system architecture (IA-SA), and the IA technical architecture (IA-TA), will provide the perspective to support securing and protecting the Global Information Grid.

The panel received two briefings on IA-TAs. The first was a briefing on Section 2.6 (Security) of the DoD Joint Technical Architecture (JTA). The JTA identifies the services, interfaces, standards, and their interlocations and provides the technical guidelines for implementation of information systems and services. The standards selected for the JTA are selected primarily from the private sector IT industry although some military specific (MILSPEC) standards are included where no commercial counterpart exists. Figure 21 provides a summary of the JTA security chapter.

The panel noted that the standards called out in the JTA for mandated standards are consistent with those noted in the ISO security reference model presented previously. The concept, processes, and content of the JTA, and specifically Section 2.6, are strongly endorsed by the IAA Panel.

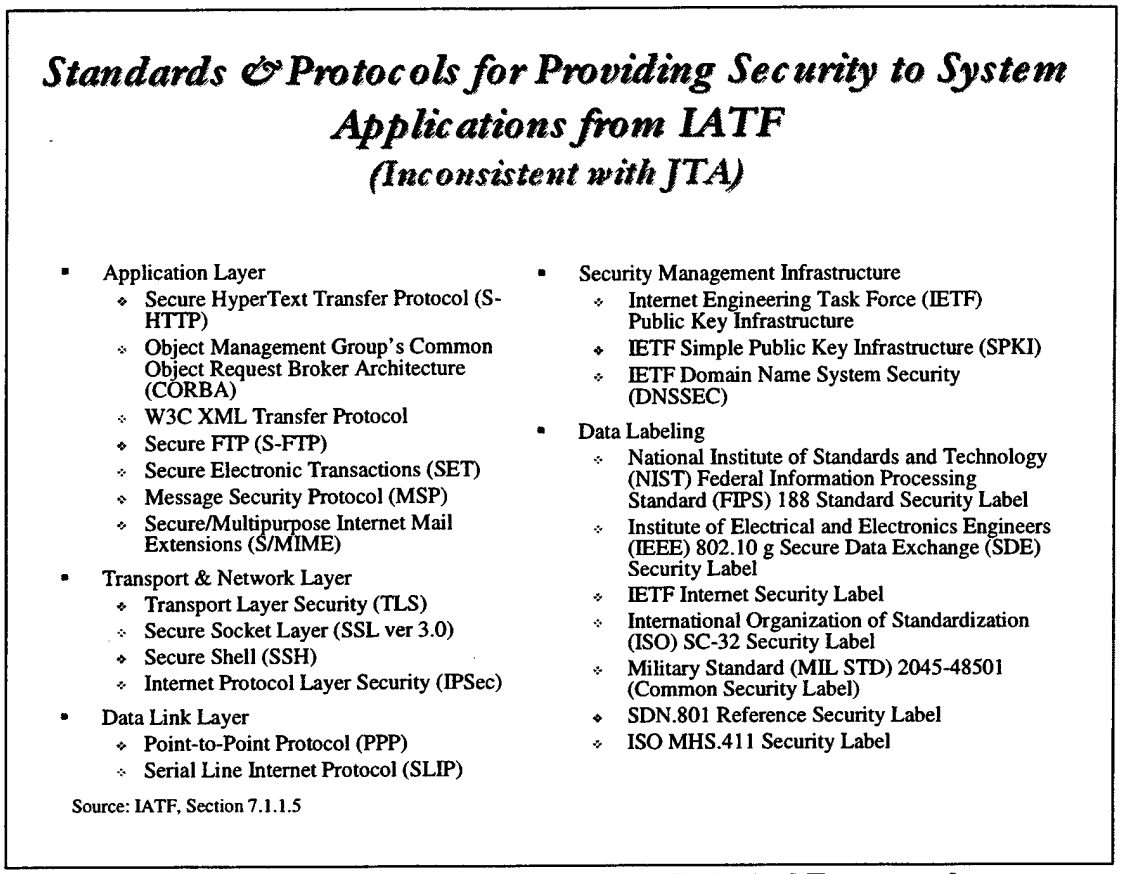

Figure 22. Information Assurance Technical Framework

The second technical architecture briefing to the panel concerned the Information Assurance Technical Framework (IATF), an excerpt of which is provided in Figure 22. The panel found this document to be a tutorial and collection of useful generic information on IA. The panel noted, however, that the section of the IATF associated with standards and protocols for providing security to system applications is incorrect and inconsistent with the JTA. The IATF, unlike the JTA, is not a standards setting or selection document. Rather, the IATF Forum has been organized to encourage participation by vendors of (largely COTS) IA products and services. The major focus of the IATF is the development of protection profiles (under common criteria) that will be used to evaluate products, i.e., under the national Information Assurance Partnership (NIAP) program operated by NIST and National Security Agency (NSA). There is no unified architectural underpinning for the IATF. This is to be expected, i.e., security evaluation criteria such as the Common Criteria (CC) (and product profiles based on the CC) tend to be architecture independent. As a result, the collection of standards cited by the IATF, as briefed to the panel, lacks architectural continuity and it is not an appropriate alternative to the work of the JTA.

Many of the security standards that are collected in the IATF are experimental or did not gain acceptance in the Internet. For example, secure hypertext transfer protocol (S-HTTP) is not implemented in any commercial browsers or servers; it lost the protocol battle to SSL/TLS. SPKI is not a standard, but rather is the experimental output of a failed IETF working group, not

Page 902 of 3957

supported in commercial products. The Public Key Infrastructure Working Group (PKIX WG) of the IETF produces standards based on X.509, which are implemented in a wide variety of products. Moreover, the other IETF security protocol working groups make use of the PKIX standards, not SPKI. The IATF referenced a wide range of security labeling standards that are a mix of redundant and/or superceded documents.

The IATF thus suffers from the same problems associated with the TAFIM; it is a collection of history and general information – not a document that can be used to implement interoperable, secured information systems for DoD.

The panel notes, with concern, that DoD policy requires that the JTA be used as the "building code" for the DoD information infrastructure. On the other hand, the recent document from the Deputy Secretary of Defense, subject "Department of Defense Chief Information Officer Guidance and Policy Memorandum no. 68510," Department of Defense Global Information Grid Information Assurance (ASD/C3I) suggests that the IATF and published Common Criteria Protection Profiles be consulted "for guidance... and IA solutions that should be considered to counter attacks."

The panel's concern is the apparent confusion these two policy statements could cause within the IA community. The IATF standards are incorrect and inconsistent with the JTA and private sector practice. The panel believes the JTA is the better reference on IA standards and protocols, and it should be referenced as such in all GIG IA policy documents.

Page 903 of 3957

3.5 METRICS

Joint Staff J6, IA Metrics

- Performance-based
- Integrated into operational readiness reporting
- CINCs report as part of JMRR process
- Example

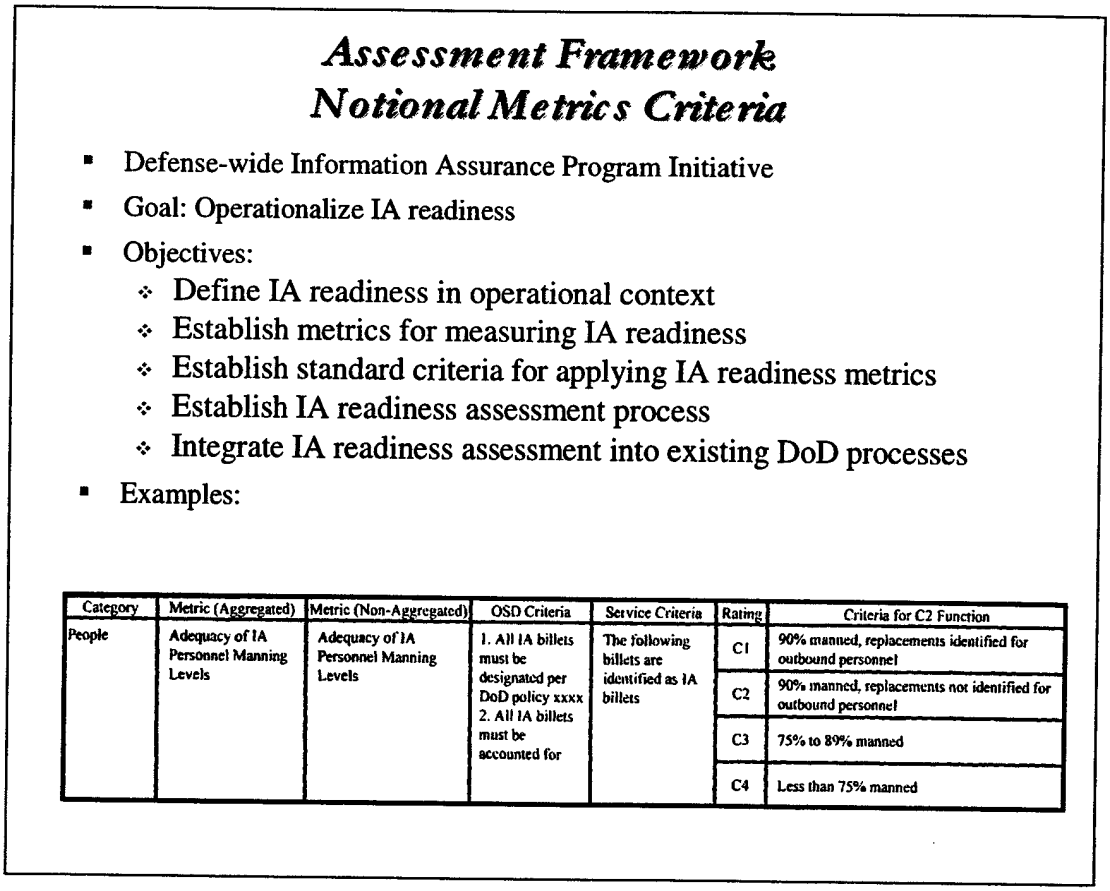
INFORMATION ASSURANCE METRICS (List 1)					
1.0	**PLANS AND OPERATIONS**				
Joint Readiness C-Level	**PLANS AND OPERATIONS ASSESSMENT**				
C-1	..... **minor** deficiencies ..... with **negligible** impact on capability to perform required missions.				
C-2	..... **some** deficiencies .... with **limited** impact on capability to perform required missions.				
C-3	..... **significant** deficiencies ... **prevent** it from performing some portions of required missions.				
C-4	.... **major** deficiencies .... that **preclude** satisfactory mission accomplishment.				
1.1	**Plans** — Planning involves both those specialized IA plans and IA portions of operations plans. IA Planning should identify necessary resources in detail.				
1.1.1	IA portion of concept of operations and operations plans; standard operating procedures (SOP), continuity of operations plan developed and effectively implemented.	C1	C2	C3	C4
1.2	**Operations** – ongoing execution of daily IA support procedures....				
1.21	Garrison Operations –IA strategy should support military operations				
1.21.1	IA integrated sufficiently in current/ongoing operations	C1	C2	C3	C4
1.2.2	**Deployed JTF operations**				

Figure 23. J6 IA Metrics

As noted in the GIG reference material (see Figure 6), metrics play an important role in architecting and deploying this infrastructure. The panel, therefore, chose to address this topic as a stand-alone topic outside of the DoD C4ISR architectural framework. Only two specific initiatives addressing IA metrics with DoD were presented to the panel. They are described next.

Figure 23 provides an overview of IA operational readiness metrics developed by the Joint Staff. These metrics are used by the CINCs to assess and report on IA readiness as part of their overall readiness assessment. The panel noted that these metrics are a good starting point to raise the awareness and importance of IA as a critical warfighting requirement. Although these metrics are difficult to measure, are not yet comprehensive in nature, and do not address the CINC's warfighting capabilities as supported or hindered by the IA capabilities, they do raise IA awareness within a CINC's organization, and they do begin to raise the importance of IA to the warfighter. The panel recognizes that this set of metrics will evolve and improve over time.

Page 904 of 3957



Category	Metric (Aggregated)	Metric (Non-Aggregated)	OSD Criteria	Service Criteria	Rating	Criteria for C2 Function
People	Adequacy of IA Personnel Manning Levels	Adequacy of IA Personnel Manning Levels	1. All IA billets must be designated per DoD policy xxxx 2. All IA billets must be accounted for	The following billets are identified as IA billets	C1	90% manned, replacements identified for outbound personnel
					C2	90% manned, replacements not identified for outbound personnel
					C3	75% to 89% manned
					C4	Less than 75% manned

Figure 24. Assessment Framework

The second initiative on establishing IA metrics is being conducted under the auspices of the Defense-wide Information Awareness Program (DIAP). A team has been established and is tasked to develop an IA readiness assessment framework and associated metrics. The team has begun the process of defining quantifiable IA metrics and associated ratings, as indicated by the example in Figure 24. The panel noted that the metrics presented by the speaker overlapped to some degree with those presented by the J6 briefer. The panel understood that the J6 metrics are intended to be integrated with the DIAP metrics in a process that will provide a DoD-wide IA readiness assessment.

Based on the two briefings, however, the panel felt that greater coordination is necessary between the two efforts. The message conveyed by the speakers tended to leave the impression that these efforts were not tightly coordinated, could lead to duplication of effort, and, of greatest concern, could lead to confusion within the user organizations that are being assessed.

The panel felt that a single DoD IA effort should exist that addresses the spectrum of IA metrics that are necessary. This spectrum is much greater than the sets of metrics presented by the J6 and DIAP. For example, IA technology and system-architecture related IA metrics should also be developed and used to assess progress and residual vulnerabilities in the GIG as it is deployed and improved over time. The panel could identify no specific, focused initiative on developing such technical metrics. The panel's suggestions regarding metrics are provided in the next section of this report.

3.6 WIRELESS

The panel noted that wireless-infrastructure IA issues were not raised in any of the briefings it received. Although wireless data communications over military owned/operated systems is well understood and IA is typically provided through transmission security (TRANSEC) at the physical layers and communication security (COMSEC) at the application layer, the private sector wireless infrastructure that today is embedded in the GIG was not addressed as an area of concern within DoD. The panel notes that private sector wireless media can be used as a means to gain access and control of the "wired" part of the commercial infrastructure (at network management layers). This wireless segment of the infrastructure must be carefully protected. As a result, this issue is addressed in greater depth in the next section of this report.

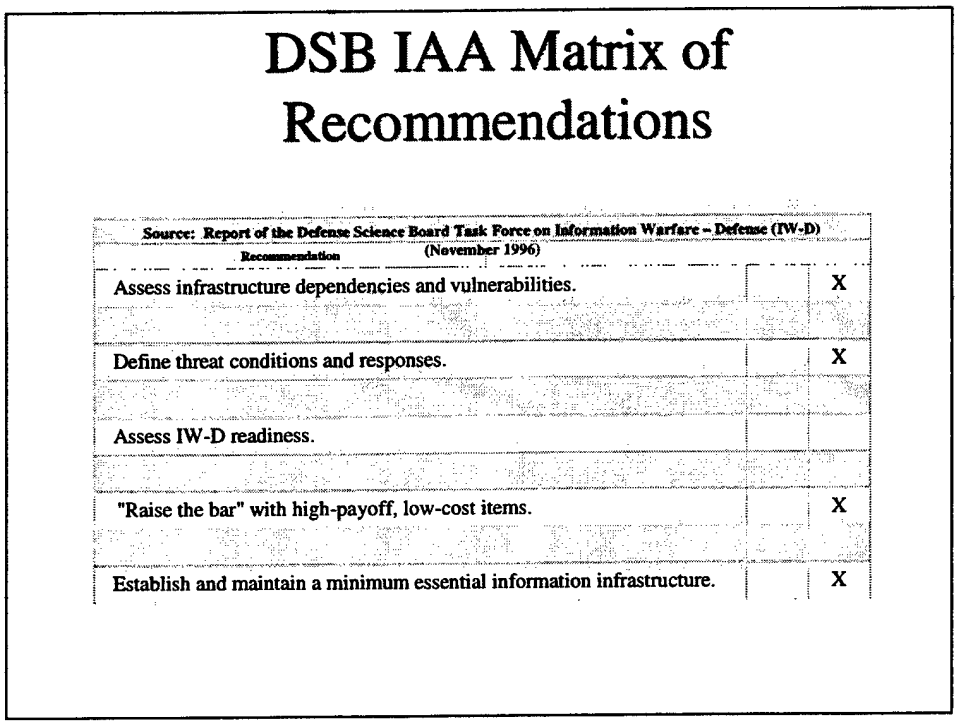


Figure 25. DSB IAA Matrix of Recommendations

3.7 SUMMARY OF FINDINGS

As part of our findings, the panel notes that the 1996 DSB Summer Study made four overarching recommendations related to IAA. These recommendations are listed in Figure 25. From the preceding discussion, the panel makes the following observations.

Recommendation 1: Assess infrastructure dependencies and vulnerabilities. The DoD today is relying primarily on the private sector to assess NIPRNET infrastructure dependencies and vulnerabilities. As vulnerabilities are identified, the DoD implements the associated fixes within the NIPRNET (software patches, virus filtering, IDS templates) using DiD as the basis for its system architecture. However, the panel notes that there is currently no methodology for "engineering" DiD. There are processes for implementing DiD updates, but there is no engineering discipline that allows for the design of a DiD solution with confidence in the security

it offers in the face of various threats. The premise underlying DiD is that an acceptable level of protection can be achieved through layering of defenses, even though each defensive technology is known to be imperfect, i.e., each one is known to have residual vulnerabilities or functional shortcomings. Also, central to the DiD premise is the assumption that each layer of defense exhibits functional deficiencies or vulnerabilities that are independent (ideally orthogonal), and thus the ability to penetrate one defensive layer dos not imply the ability to penetrate other layers (by the same means). However, to the extent that many of these defenses are built upon COTS operating systems (OS) that are known to be vulnerable, but for which not all residual vulnerabilities are known, this premise is questionable. Moreover, not all the flaws in each defense mechanism are likely to be known because they are COTS products with low to medium assurance. Thus it is not possible to estimate the extent to which such layered defenses increase the work factor for an attacker, above and beyond the OS problem cited above. (Nonetheless, there is reason to believe that the work factor is increased, at least for low-grade threats.) None of these observations implies that DoD should not pursue DiD. Rather, they suggest that additional effort is needed to develop a suitable methodology that will support DiD engineering and deployment. They also suggest that prospective users of a DiD strategy should be apprised of the uncertainty associated with both the strategy and its implementation.

Recommendation 2: Define threat conditions and responses. The DoD information condition (INFOCON) policy and procedures are well established, promulgated and understood. The panel does not believe, however, that DoD has experience in understanding (how consistent and timely the responses will be executed throughout DoD) upon INFOCON status changes. Furthermore, the panel believes that experience is lacking in assessing how effective the INFOCON procedures will be in thwarting an attack. Gaining this experience, through continuous exercises and the assessment of INFOCON responses to varying red-tem attacks, is an important process to establish.

Recommendation 3: "Raise the Bar" with high-payoff, low-cost IA Initiatives. The panel notes that a great deal of progress has occurred here as well. DoD has established an IAA framework, it has selected a systems architecture, and it is deploying DiD solutions; it has increased user/community awareness of the IA problem. The panel does note, however, that work remains to be done. Simple but strict IA configuration management practices at all DoD information sites is still a critical issue; closing all NIPRNET connections to the public Internet (other than through the 8-11 DoD gateways) remains an unresolved issue; and the insider threat on the SIPRNET and JWICS remains an open issue although suitable IA technologies and processes to mitigate this risk are available.

Recommendation 4: Establish and maintain a minimum essential infrastructure. The panel did not receive any indication that this recommendation was being pursued by DoD. In fact, DoD has focused on deploying a GIG with integrated IA services. The panel does support the goal of deploying and securing the GIG, but notes the following: the GIG is being deployed based on a security strategy referred to as "risk management," not one aimed at achieving an impenetratable minimum essential in infrastructure. It has been suggested that, in the past, security experts focused on achieving "perfect" security, which can be viewed as a "risk avoidance" strategy. In fact security experts have long acknowledged that perfect security is unattainable. Risk management argues for explicitly making a decision to accept a certain level of risk as a condition of deploying a system. This is a fine principle, but it is based in part on the

premise that one can evaluate (and quantify) the residual risks associated with a system composed of components that are known to be imperfect. This is a questionable assumption. First, although one might be aware of some set of residual vulnerabilities in the system components, it also is likely that these components contain other, unknown vulnerabilities of undetermined severity. Second, there is no algebra that allows the computing of the risk associated with deploying a system composed of components with known vulnerabilities, much less a system in which the components have unknown vulnerabilities. Thus it seems certain that risks of unknown magnitude are being accepted when the phrase "risk management" is part of the security design and accreditation process. This issue can, at this time, only be addressed through empirical means whereby a representative segment of the deployed GIG is subjected to a comprehensive and continuous IA vulnerability assessment process. A "testbed" concept will be proposed in the next section as a means to address this need.

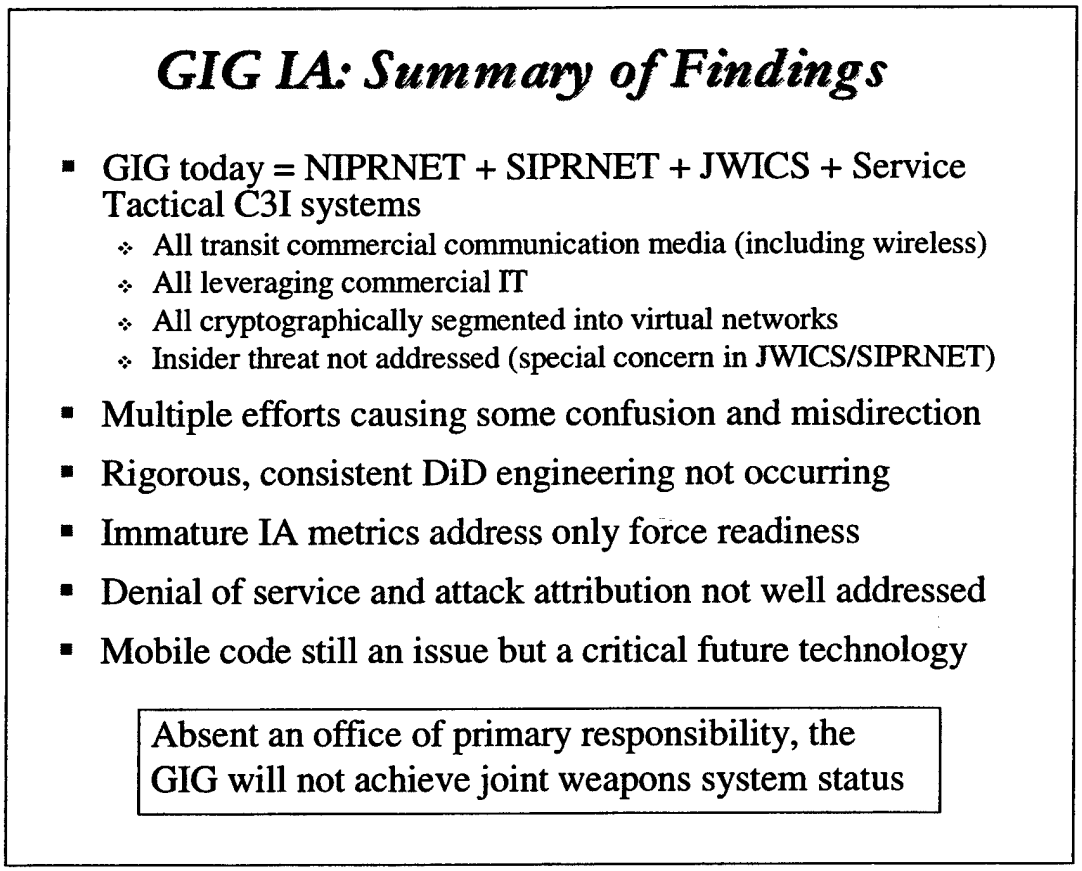

Figure 26. GIG IA Summary of Findings

In closing this section of our report on panel findings, Figure 26 provides a summary of our observations. The Global Information Grid does comprise multiple virtual worldwide data networks, the NIPRNET, SIPRNET, JWICS and service tactical C3I systems. These networks use shared commercial communications media and commercial information technologies. In addition, all are cryptographically segmented into virtual networks. However, the panel noted that there is virtually no protection against the insider threat, especially for the classified networks. All services are adopting a Defense-in-Depth (DiD) strategy, with different

implementations. For example, the Air Force is employing a different strategy from the Army: a different protocol translation architecture; a different location for performing enclave level intrusion; and different measures for enclave access control. The panel notes that while there is a general framework for implementing DiD, there is no engineering discipline that allows for design of a DiD solution that provides confidence in security against a variety of attacks.

The current emphasis on information assurance metrics is focused on readiness and is not addressing the metrics needed to assess and measure mission, system or technical level performance. In addition, denial-of-service measures and attack attribution metrics are not well addressed.

Finally, the panel believes that today's DoD organizational structure is inadequate to deliver a GIG. Although both the DoD Chief Information Officer (CIO) Executive Panel and the Military Communications and Electronics Board (MCEB) are working on defining and providing guidance for the GIG, the panel feels that a new organizational structure, with a centralized primary point of responsibility, will be required to develop a GIG worthy of weapons system status.

Specifically, the current charter of the DoD CIO Executive Board is contained in the DepSecDef Memo Subj: DoD Chief Information Officer Executive Board, 31 March 2000. This charter states that the Council is the principal forum to advise the DoD CIO on the full range of matters pertaining to the Clinger-Cohen Act (CCA) of 1996 and the Global Information Grid. Additionally, the board also coordinates implementation of activities under the CCA, and exchanges pertinent information and discusses issues regarding the GIG, including DoD information management (IM) and information technology (IT). The primary mission of the board is to "advance the DoD's goals in the areas of IM, information interoperability and information security between and among Defense Components." The Board also coordinates with the IC CIO Executive Council on matters of mutual interest pertaining to the GIG. Its management oversight includes recommending, reviewing, and advising the DoD CIO on overall DoD IM policy, processes, procedures and standards, as well as overseeing all aspects of the GIG to support the DoD's and IC's mission and business applications. This includes the collaborative development of IT architectures and related compliance reviews; management of the information infrastructure resources as a portfolio of investments; collaborative development of planning guidance for the operation and use of the GIG; and identification of opportunities for cross-functional and/or cross-component cooperation in IM and in using IT. The board's architecture management responsibilities include ensuring the collaborative development of architectures as specified in the CCA, and ensuring that processes are in place to enforce their standardized use, management and control, as well as aligning IT portfolios with the GIG. Although the board has budgetary review authority for IT investments, and can make recommendations, it has no direct budgetary authority. It also has no authority, either review or management oversight, over the warrior components of the GIG. The membership of the DoD CIO Executive Board includes:

- Chair: DoD CIO (ASD (C3I))
- Members: CIOs of the Military Departments
  - CIO, Joint Staff

  - USD (AT&L)
  - USD (P) (Policy)
  - USD (C) (Comptroller)
  - USD (P&R) (Personnel and Readiness)
  - ASD (C3I) (usually the Deputy CIO)
  - Director PA&E (Program Analysis and Evaluation)
  - J6, Joint Staff
  - OPNAV N6
- Director, Communications and Information, USAF, AF/SC
  - IC CIO
  - CIO, JFCOM (Joint Forces Command)
- Security Advisor: Director, National Security Agency (DIRNSA)
- Technical Advisor: Director, DISA
- Legal Advisor: DoD General Counsel

The charter of the MCEB is contained within DoD Directive 5100.35 dated 10 Mar 1998. The MCEB considers those military communications-electronic matters, including those associated with national security systems (NSS) referred to it by the SecDef, CJCS, the DoD CIO, secretaries of the military departments, and heads of DoD components. The mission of the MCEB is to obtain coordination among the DoD components, between the Department of Defense and other governmental departments and agencies, and between the DoD and representatives of foreign nations on matters under the MCEB jurisdiction. The MCEB provides guidance and direction to the DoD components and advice and assistance as requested. The membership, as listed below, is primarily composed of those in charge of the communications activities in the listed components, which have little, if any, authority over IT issues in other portions of their component. The MCEB has no budgetary review or execution authority over any component, nor is there any mechanism within the MCEB structure for enforcement of non-compliance with decisions. The relationship between the MCEB and CIO Executive Board is still being discussed, but in effect, the MCEB is a subordinate activity under the direction of the CIO Executive Board and its recommendations are referred to that Board for final decision. Membership of the MCEB includes:

- Chair: Joint Staff, J6
- Members: Vice, J6
  - DISC4, U.S. Army
  - OPNAV, N6
  - HQ USAF, SC
  - HQMC, C4
  - USCG, Assistant Commandant for Systems
  - Director, DISA

Page 910 of 3957

- Director, NSA
- Director, DIA

Thus, neither the DoD CIO Executive Board nor the MCEB has the membership or authority over budgets and execution activities that the panel believes are necessary to ensure the GIG is built and managed as intended by the IAA Panel. Without that level of authority over all elements of the GIG, the architecture is subject to interpretation by each component based on its needs, rather than the needs of the entire DoD enterprise. There is also little incentive to address crosscutting issues in a coherent fashion when the funding for these programs is provided via Title 10 channels without some mechanism to encourage cooperation. Because of the Title 10 and DoD versus intelligence community issues, the only level of management senior enough to cross this bridge is at the DepSecDef level. Additionally, neither of these two boards has a direct oversight responsibility over any specific office or organization that carries out its direction.

Page 911 of 3957

CHAPTER 4. "WHAT MIGHT BE DONE" PANEL SUGGESTIONS

4.1 THE GIG IS A WEAPON SYSTEM

The GIG is a Weapon System

- It leads to information/decision superiority, therefore it will be attacked by our adversaries
- Built unlike a traditional weapons system
  - Critical elements not owned by the DoD
  - A platform shared by all DoD users
  - Built primarily from COTS components
  - Components evolve very rapidly
- Attacked more readily
  - Low "cost of entry" for attackers
  - Easy to deny service globally
  - Attacks escalate rapidly (compressed Observe, Orient, Decide, Act [OODA] loop)
  - Attack attribution is difficult
  - Forensics processes & technology are immature

Figure 27. The GIG is a Weapon System

Information superiority is the pacing item in realizing the goals of JV2020, and the Global Information Grid is the underlying information superiority infrastructure. The panel argues, in Figure 27, that because of its importance, the GIG should be viewed as a weapons system, one that will present a lucrative target for our adversaries. However, unlike traditional weapons systems, the critical elements of the GIG are not owned or controlled by the DoD. Furthermore, the GIG is shared by all DoD users and is built primarily from COTS components, which are rapidly evolving.

A significant weakness of the GIG is that it can be more readily attacked than traditional systems, which are far less ubiquitous and have limited interfaces and stricter controls. This is due to several factors, but first and foremost is the low capital cost of entry for attackers. A few people with personal computers and Internet access have demonstrated the capability to deny

Page 912 of 3957

service and penetrate DoD systems. Attacks have a non-linear characteristic in that they can escalate rapidly, as evidenced by the recent distributed denial-of-service attacks. Unfortunately, attacker attribution is difficult if not impossible today. The attacker enters third party machines and uses those facilities to launch attacks. Current processes and forensics for identifying and tracing attackers are primitive and do not provide adequate support for attribution.

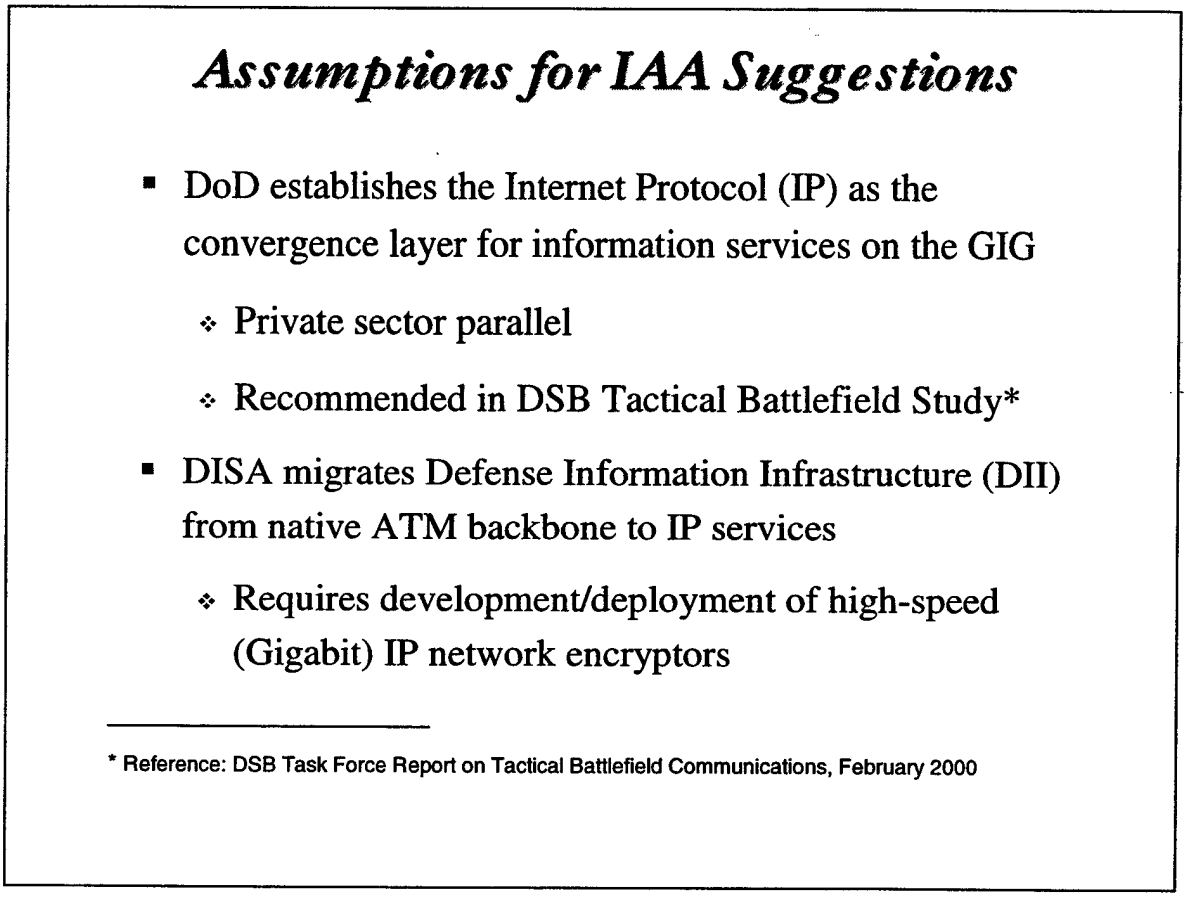

Figure 28. Assumptions for IAA Suggestions

Figure 28 provides the assumptions that are the foundation of the panel's IAA suggestions. These assumptions are based on the following. In the private sector, a trend is underway to develop a single infrastructure providing integrated voice, video and data services. This trend to a common, shared infrastructure for all multimedia services is termed "convergence." The convergence is facilitated by and expected to occur through a common, ubiquitous protocol – IP. This protocol is an open standard supported worldwide by the data telecommunications industry; it is rapidly becoming the convergence layer for all information services on the Internet.

The common IP layer separates the task of telecommunications (transport) from the tasks of service types, information types, and application development. Network engineers concentrate on moving IP packets from one place to another, independent of their content. Application and service developers concentrate on applications and count on the IP layer to provide requested telecommunications services.

The present version of the IP, designated Internet Protocol Version 4 (IPv4), does not yet support QoS-based dynamic resource allocation, a capability needed to support real-time, stream-oriented information flow (i.e., real-time voice and video). In the near term, this limitation is being addressed through higher-layer protocols such as the Real-Time Protocol (RTP), and the Resource Reservation Protocol (RSVP) and via tag switching. In addition, extensions to IPv4, to include a minimum level of QoS, are being investigated by the Internet Engineering Task Force (IETF). The IETF is also working on the next generation of IP, called IPv6, which will include QoS (called differentiated services) and a much larger IP address space, permitting the integration into the Internet of embedded processors (sensors) and many more addressed devices as users.

Today IP is used over many dissimilar networks including: ATM, Ethernet, wireless 802.11, Cellular Digital Packet Data (CDPD) and the like. IP was designed to be the mechanism for transparently moving bits across such networks. Thus, IP is the mechanism that permits the integration of these many types of networks into a network-of-networks – that is, the Internet.

The panel noted that a prior DSB study made a strong recommendation that DoD establish IP as its convergence layer for the GIG.[6] In our discussions with DISA, the briefer observed that he was strongly in favor of migrating the Defense Information Infrastructure (DII) to an IP service infrastructure, resulting in IP being the standard interface to the DISA-supplied point of presence (POP) at all DoD sites supported on the DII. This migration would place DII in the mainstream of the private-sector migration toward a converged infrastructure. Thus, DoD, through DISA services, could fully take advantage of private sector IT.

It was noted that to support this migration, DISA would need high-speed, Type 1, IP network encryption technology. Today DISA uses ATM encryptors developed by DoD, given that DISA provides ATM service to POPs. The panel noted that DoD is supporting the development of equivalent IP devices.

Thus, the panel assumes, in what follows, that DoD will migrate to IP as its convergence layer for the GIG. By doing so the DoD benefits significantly not only in leveraging commercial IT transport technology and services, but also from the perspective of leveraging emerging private-sector IA and IAA technologies, protocols and services.

Page 914 of 3957

4.2 ARCHITECTURE SUGGESTIONS

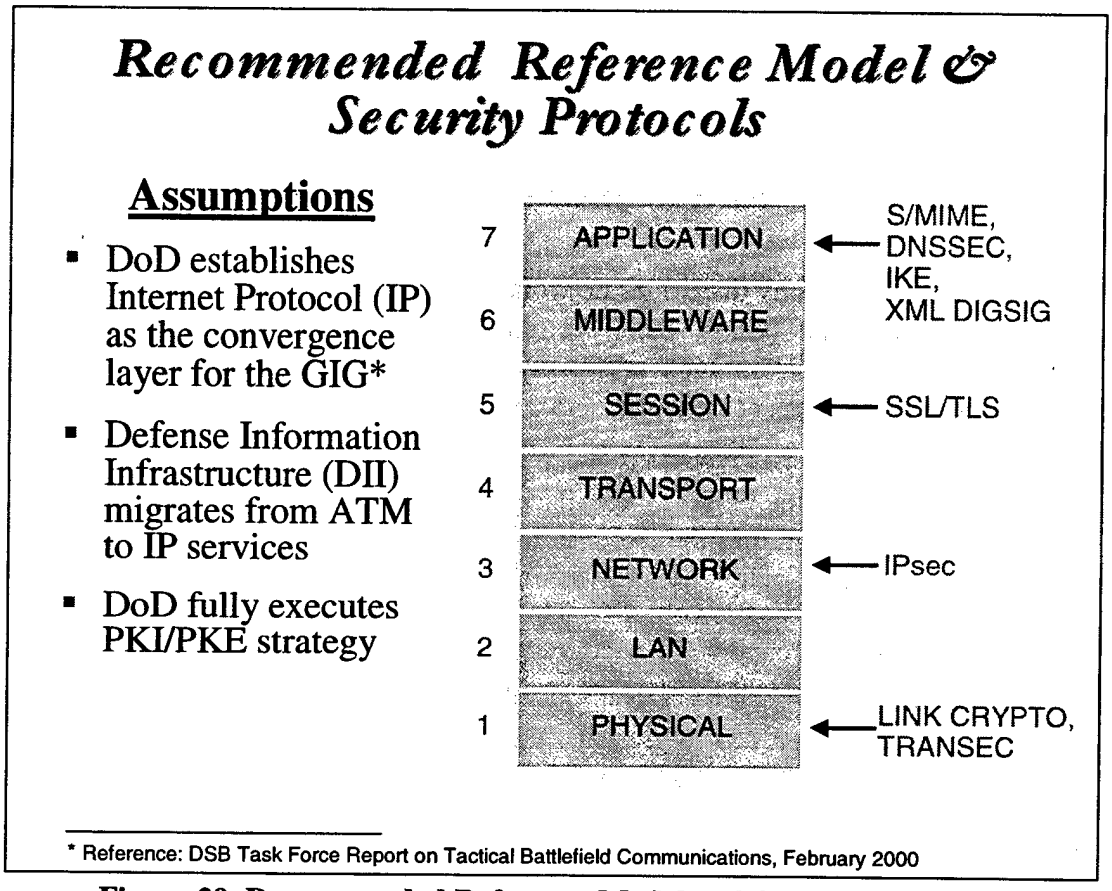

Figure 29. Recommended Reference Model and Security Protocols

The panel's suggested IA reference model is shown in Figure 29. This protocol stack assumes the use of internet protocols in a wide range of environments, including both tactical and strategic. It parallels the ISO reference model (ISO 7498), with the substitution of a "middleware" layer in lieu of the presentation layer, and is consistent with the TCP/IP protocol suite. (This substitution seems appropriate because modern systems do not make use of separate presentation layer functions; these functions are assumed by applications.)

Physical layer protection is afforded via link crystographic systems (i.e., KG 84, KG 189,etc.) on a hop-by-hop basis, where warranted by threat concerns. No data link security; i.e., LAN security protocols such as IEEE 802.10, is recommended. This technology has not been adopted by product vendors and is generally not warranted in switched LANs, when higher layer security protocols are employed. IPsec is recommended for end-to-end, enclave-to-enclave, or end-to-enclave protection. No transport (i.e., TCP) layer security protocol is recommended because there are no widely used standards yet available, and because the services provided at the IP and session layers obviate the need for transport layer security.

Page 915 of 3957

Although the Internet protocol stack does not include a session layer per se, the introduction of SSL, SSH, and analogous security protocols has created one. SSL is widely deployed and DoD policy calls for its use for secure web access. We recommend its use with client (not just server) certificates, for high quality user authentication and access control, with transition to TLS (the IETF standard) as it becomes more widely available.

The panel has inserted a "middleware" layer to accommodate systems such as Common Object Request Broker Architecture (CORBA), distributed computing environment (DCE), or Enterprise Java Beans (EJB). However, such systems are not universally required and there is no clear appropriate choice among these competing middleware technologies at this time. Finally, several critical protocols exist at the application layer, and more may emerge. For secure e-mail, S/MIME (v3 with enhanced security services) is the preferred protocol, and it is widely available in COTS products. Secure DNS is an essential infrastructure security component requiring DISA as well as base-level support. Internet Key Exchange (IKE) is the key management protocol used by IPsec. As the extensible markup language (XML) becomes more common, the digital signature standards developed for it will become critical elements of more sophisticated web security designs, supplementing, but not supplanting, SSL/TLS.

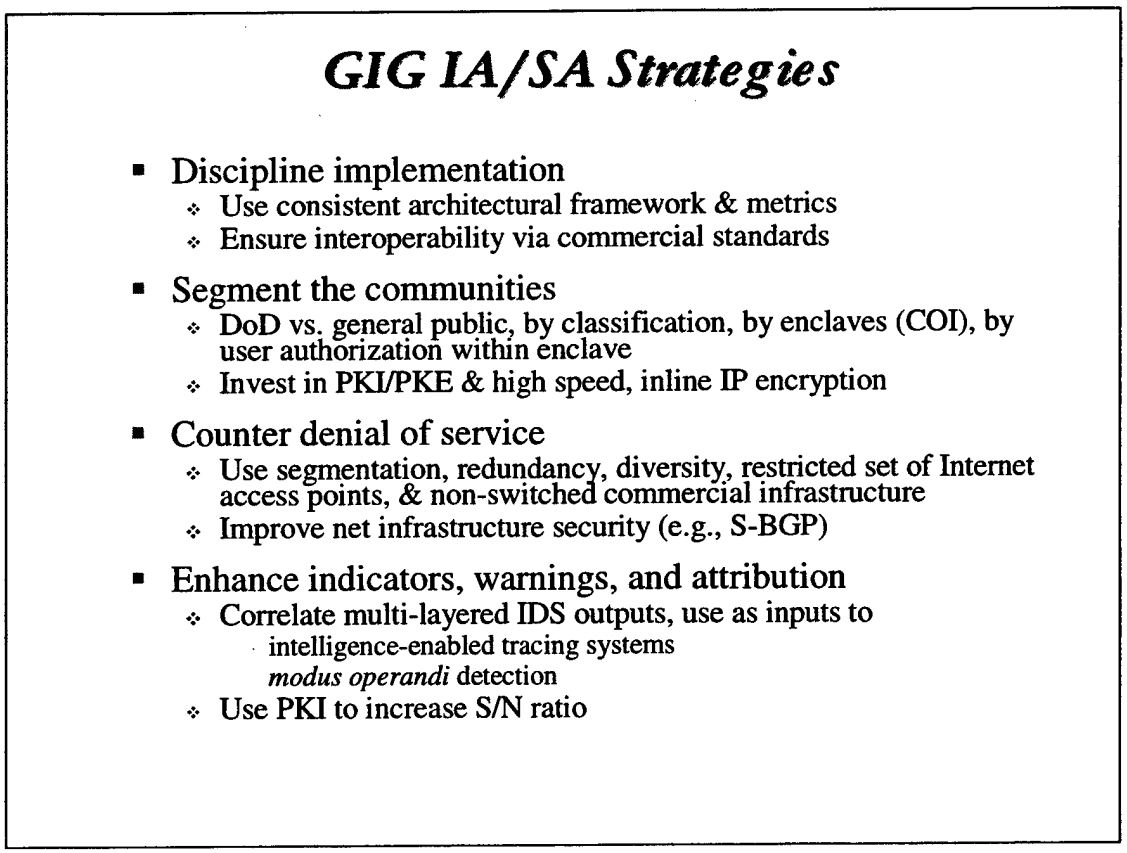

Figure 30. GIG IA Strategies

Figures 30 and 31 outline the GIG IA system architecture strategies recommended by the panel, representing the underlying themes that are embodied in the later recommendations. The first strategy is to use a consistent architectural framework and metrics across the entire DoD

GIG. This strategy lies in contrast to the current divergence of approaches between the services. It is important to foster interoperability via commercial standards, so that commercial and government off-the-shelf technology can be employed throughout the system. The defense-in-depth approach leads to the strategy of segmentation. Segmentation is recommended between the DoD and the general public Internet, between levels of classification, by enclaves (COI), and by individual user within an enclave. In order to support segmentation, investment will be needed in high-speed in-line IP encryption devices, and in large scale PKI and PKE.

Segmentation, redundancy, diversity, a restricted set of Internet access points, non-switched commercial infrastructure, and improved overall net infrastructure security, such as S-BGP (Secure Boundary Gateway Protocol), used in concert can partially mitigate the denial-of-service threat.

Another important element of the strategy is to enhance indicators and warnings and attack attribution. By correlating multi-layered IDS outputs, one can detect patterns of behavior that may indicate a modus operandi. This can be useful in tracing the sources of unwanted behavior. The correlated outputs of host- and network-based IDS at various levels can also be used to direct attention to potential threats. Resources such as human system administrators and various intelligence assets can be directed in this way. The use of a PKI and PK-enabled applications can greatly reduce the noise level of amateur attacks coming into the GIG, and thus increase the signal to noise ratio of the existing indicators and warnings in the GIG.

Fine-grained access control (FGAC) is the principle that allows access to computing and communication resources to be shared, in a safe manner, among a large number of users and user communities. Technology is available to enforce FGAC with an acceptable level of computational overhead, but tools must be available to enable local administrators and users to efficiently manage FGAC for WANs, LANs, and individual hosts and servers.

Accountability is supportive of FGAC and acts as a deterrent to inside attacks. Fine-grained identification and authentication, i.e., via use of level-4 PKI, provides the inputs needed to make FGAC decisions. Intrusion detection mechanisms help detect attacks that have eluded access controls, or activities that represent inappropriate use of resources by authorized personnel.

Page 917 of 3957

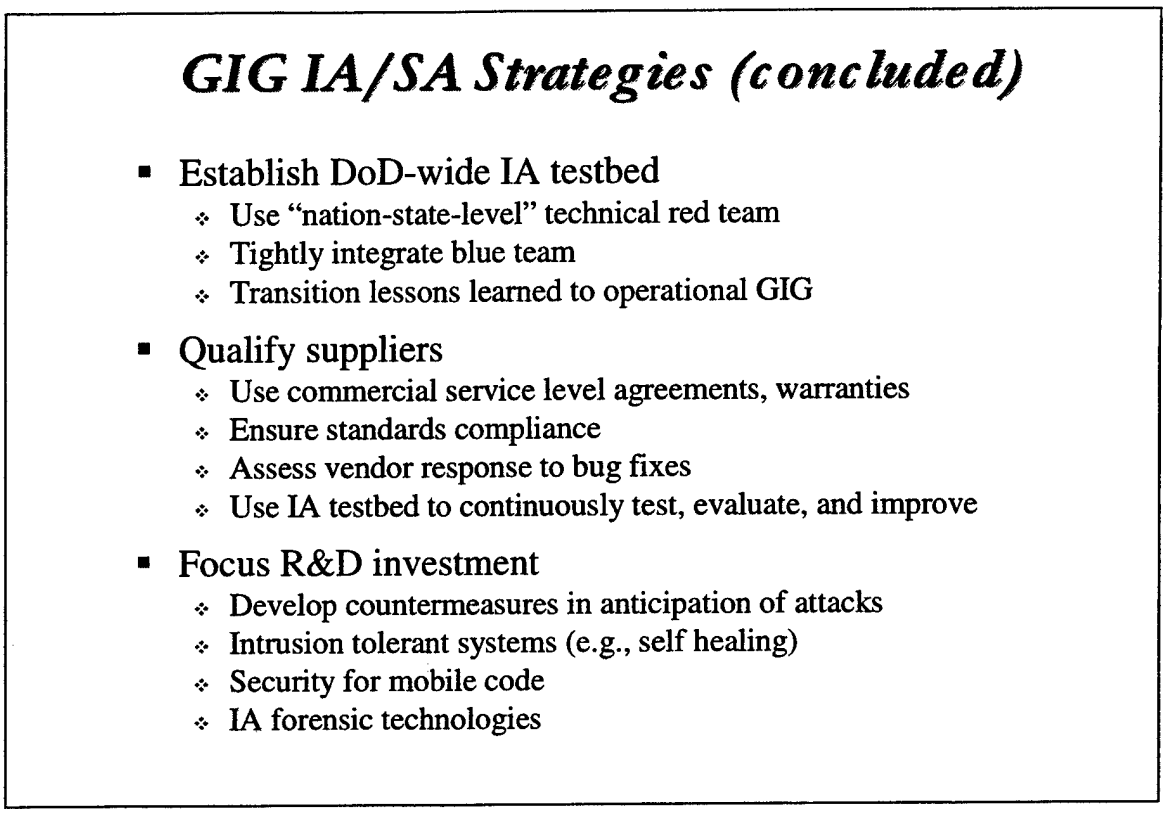

Figure 31. GIG IA Strategies Concluded

The fifth strategy is to establish a DoD-wide GIG IA testbed. This testbed would draw blue team members and current configuration information from GIG operations, and employ a nation-state-level technical red team. The lessons learned through these exercises should be used to upgrade the IA properties of the testbed, and if successful in defense, should be transitioned to the operational GIG. Building an IA testbed avoids the costs and other issues inherent in red-teaming the live operational GIG.

A sixth strategy is to more stringently qualify suppliers of GIG IA technologies than is current practice in government procurement. It is imperative that the DoD becomes a smart buyer of commercial information and information assurance technology and services. Commercial information services can often be bought with service level agreements (SLAs) and/or warranties. SLAs can cover a variety of service aspects. For example, an SLA for a communications service might cover: 1) communication speed, 2) link availability, and 3) notifying the customer within certain timelines of problems. In the future, we expect that SLAs may also address security issues.

It is also important to assess suppliers' conformance with applicable standards. There are numerous organizations that measure and certify compliance with a wide range of standards, such as Underwriter's Laboratory. In the information security area, conformance with the Common Criteria, evaluated under the auspices of the National Information Assurance Partnership (NIAP) is particularly important. The NIAP is a collaboration between the National Institute of Standards and Technology (NIST) and the National Security Agency (NSA). The NIAP encourages the development of commercial products with security features as specified in

the Common Criteria, and certifies commercial laboratories to evaluate products against the criteria under NIST's National Voluntary Laboratory Accreditation Program (NVLAP). In implementing the GIG, strong preference should be given to products evaluated under the NIAP.

Another way to qualify suppliers is to gauge their commitment to fixing security-related flaws found in their systems. There are numerous organizations that compile information about vulnerabilities in commercial systems, among them the CERT at Carnegie-Mellon University (www.cert.org), the SANS Institute (www.sans.org), Security Focus (SecurityFocus.com), and NTBugtraq (www.ntbugtraq.com). In implementing the GIG, strong preference should be given to suppliers who have a track record of quickly fixing reported flaws. Furthermore, preference should be given to products that are compatible with the Common Vulnerabilities and Exposures (CVE) list. CVE is a list of information security vulnerabilities and exposures that aims to provide common names for publicly known problems. The goal of CVE is to make it easier to share data across separate vulnerability databases and security tools with a "common enumeration."

Furthermore, while the vulnerabilities of commercial technology need to be understood, the impact on the overall GIG architecture of adding the technology needs to be weighed before employment. We recommend that the GIG IA testbed be used to address this issue. As mentioned above, there is a great deal of publicly available information about technology and product vulnerabilities. The testbed should use this information as a starting point for developing a knowledge base of technology and product benefits and vulnerabilities.

The DoD should develop a deep understanding of how commercial services are provided, so that they can be properly specified when purchased. For example, buying communication lines from multiple suppliers in order to gain redundancy and diversity may not yield the desired results, if each supplier's fiber goes through the same physical switch or runs over the same physical bridge. Instead, when buying a second communication line, DoD should specify that the line share no physical components or transit mechanisms with the first communication line.

The final strategy recommended is to adequately resource a focused GIG IA R&D program. Current DoD IA R&D does not adequately address the IA needs of the GIG. Countermeasures must be developed in anticipation of attacks. The GIG IA testbed the panel recommends can be used to experiment with potential fixes before any form of specific attacks are found live on the GIG. The development of self-healing systems that are intrusion-tolerant and fault-tolerant is an important step in deploying a reliable GIG infrastructure. Self-healing, recovery, and reconstitution of GIG components could provide continuity of operation throughout and after significant attacks. Clear commercial trends point toward mobile code as an increasingly important software distribution and maintenance mechanism. Current practices in some networks of stripping mobile code out of incoming e-mail and disabling Java and JavaScript are stopgap maneuvers. Significant focused research is called for to contain and verify mobile code, to discover new methods of utilizing mobile code to defend against attacks (i.e., throttling incoming traffic at the routers during a denial-of-service attack), and to automatically install 'good' viruses that upgrade system survivability. R&D focused on forensics, tagging, and traceback could provide GIG administrators with the tools necessary to trace attacks back to their source. Non-repudiable identification of malicious attackers and wayward insiders can provide a level of deterrence not currently in evidence.

Page 919 of 3957

4.3 DEFENSE-IN-DEPTH

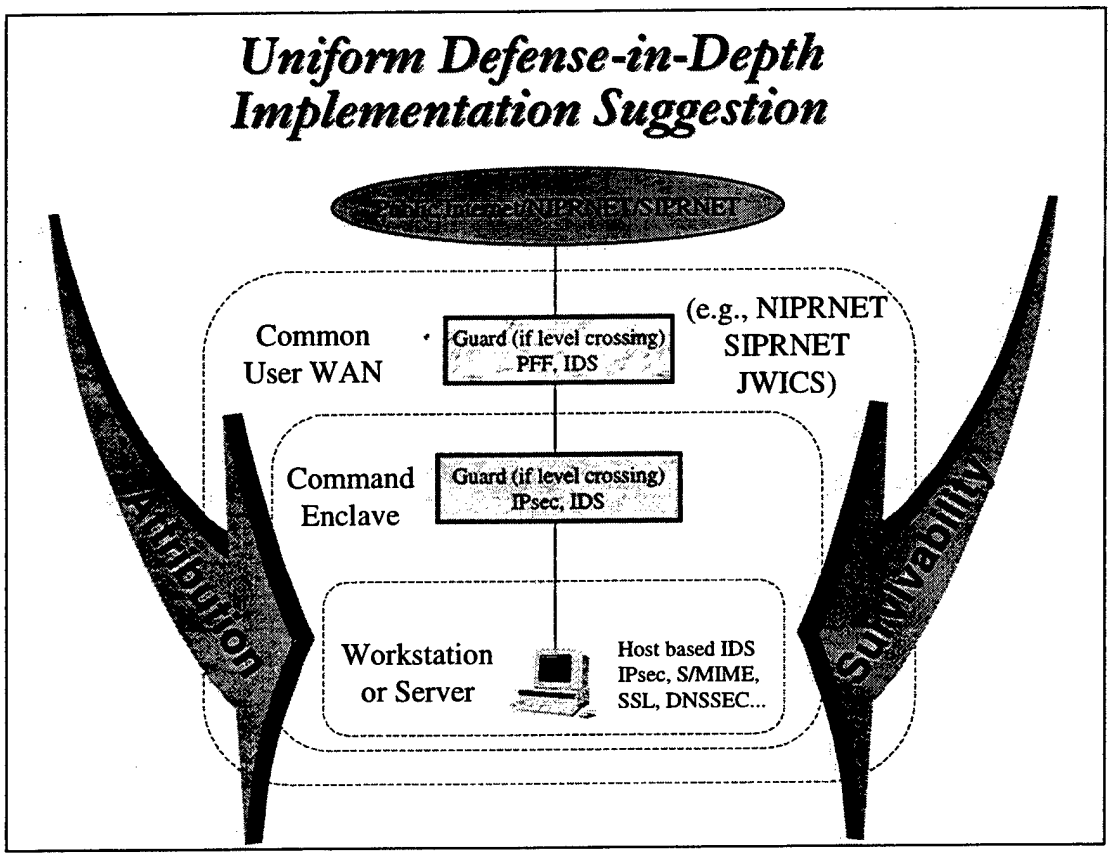

Figure 32. Uniform Defense-in-Depth Implementation

Figure 32 provides an example of layered defense, or defense-in-depth, from a traffic flow perspective. *All* DoD common user networks, SIPRNET and JWICS as well as NIPRNET, should reflect this architecture. This is a departure from current practice in which the classified networks do not provide significant barriers to attacks launched from sites in the same community, i.e., other subscribers to the same common user network.

The outer perimeter represents an interface between a single-level, common user WAN, i.e., NIPRNET, SIPRNET, or JWICS, and a less sensitive WAN, i.e., the public Internet. (If a sensitivity level is crossed, i.e., from SIPRNET to NIPRNET, then a guard is employed.) This perimeter is protected by the use of a (stateful) packet filtering firewall (PFF) and an IDS. Non-IPsec or SSL protected traffic, i.e., e-mail, DNS, and web traffic, is screened via the PFF, and restricted to destinations inside the WAN that are well-defined web servers, e-mail servers, etc. The IDS here is used to screen traffic (at very high data rates) to detect patterns of attacks against multiple sites on the WAN, through correlation of analytic data from each of these IDS systems. Virus scanning might even be applied to (non-encrypted) e-mail attachments at this point, via the use of implicit mail relays.

Page 920 of 3957

At the enclave boundary, IPsec is the primary defense mechanism, preventing unauthenticated connectivity to external sources. A PFF is used for traffic that would not be afforded IPsec protection, i.e., e-mail and DNS services. (As illustrated in later discussion, web data designed to be available for public access will be maintained outside of the enclave boundary.) The enclave IDS has access to some plaintext data (except when IPsec or SSL is used all the way to a workstation or server) and thus can perform more analysis than the WAN IDS. Virus scanning can be applied to (non-encrypted) e-mail attachments at this point, if it is not applied at the WAN boundary.

Each workstation or server is equipped with an IDS, which is monitored by the enclave security administrator. IPsec, SSL, and S/MIME are available for end-to-end cryptographic security, including authentication, integrity, confidentiality, and access control. A secure DNS resolver interacts with secure DNS servers.

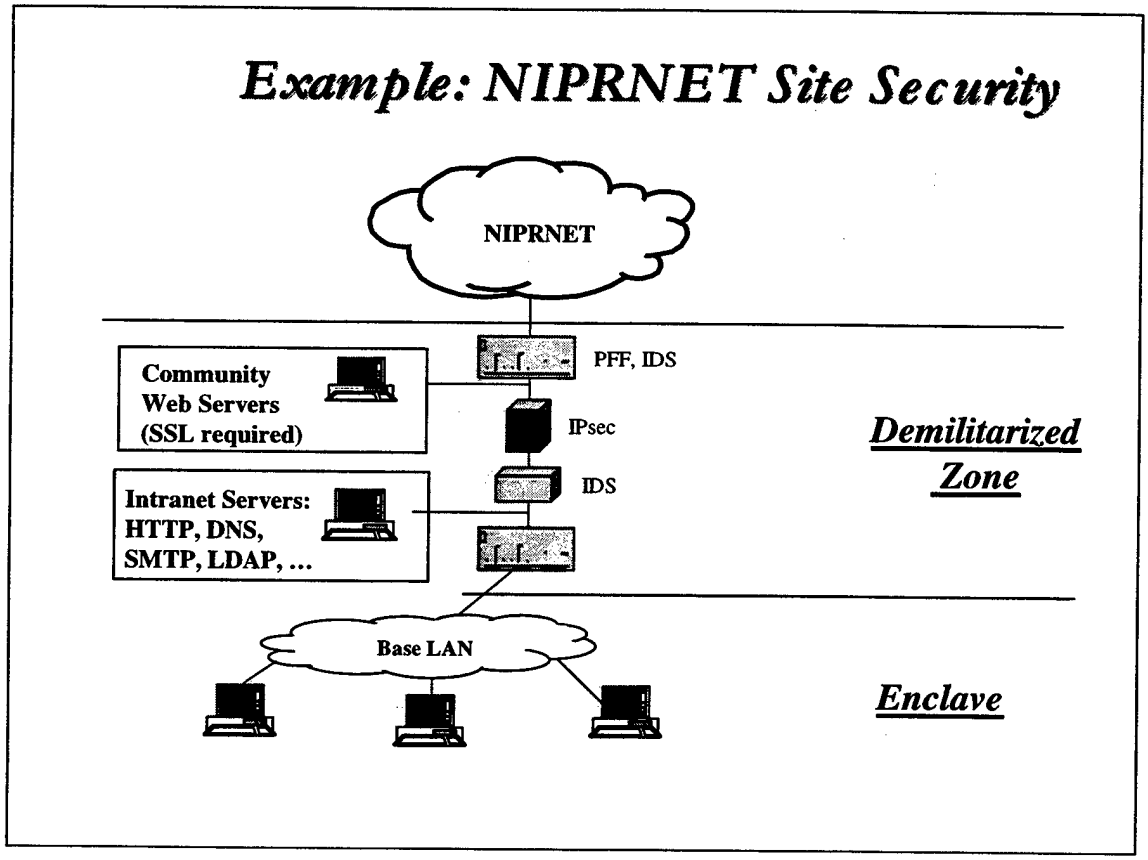

Figure 33. Example: NIPRNET Site Security

Figure 33 illustrates the IA components that would be employed at the interface to a typical NIPRNET site to implement the panel's suggested defense-in-depth architecture. The Packet Filter Firewall (PFF) at the attachment point to the NIPRNET filters out traffic that should never access the web server. The IPsec device in the DMZ is the primary access control mechanism. It implements a basic PFF, as required by the IPsec specifications (RFC 2401). This device, or one immediately behind it, incorporates an IDS that focuses on non-encrypted traffic that traverses

Page 921 of 3957

the IPsec device. Examples of such traffic include transport mode IPsec or SSL traffic destined for machines on the base LAN. (Note, S/MIME protected mail cannot be scanned for viruses at the SMTP server, but any e-mail with viral attachments can be tracked to its sender when S/MIME has been used. This provides reliable attribution of such e-mail, which acts as a deterrent and provides excellent forensics. The host-based IDS will examine incoming e-mail attachments for malicious code upon receipt and decryption.)

The DMZ IDS monitors traffic that bypasses the IPsec device (i.e., DNS traffic or SMTP traffic from the Internet) as well as decrypted traffic from other NIPRNET sites and from contractor sites. (A LAN-based approach may also be employed if technology permits.)

The servers behind the IPsec device are accessed via a mix of plaintext and crypto-protected traffic streams. For example, DNSSEC and e-mail protection is at the application layer, whereas LDAP traffic may be unauthenticated or may be SSL/TLS protected. The latter will be required for access to sensitive directory entries and for all infrastructure management functions.

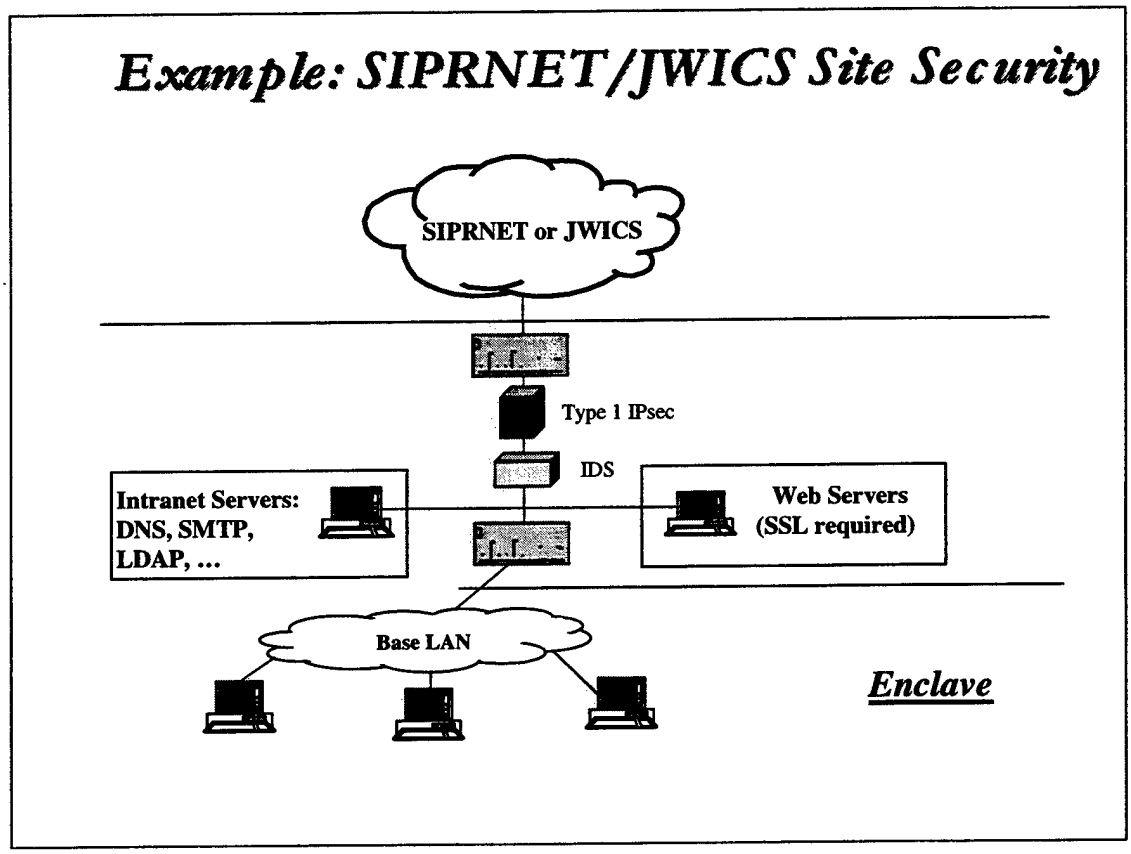

Figure 34. Example: SIPRNET/JWICS Site Security

Figure 34 is similar to the NIPRNET example. Note that there are no DMZ community servers, because all traffic is IPsec protected. This approach is feasible because there is no direct communication with sites not on the same, common user WAN. All sites on SIPRNET or JWICS will be equipped with Type 1 IPsec devices and thus all traffic entering or leaving a site is protected and subject to access controls.

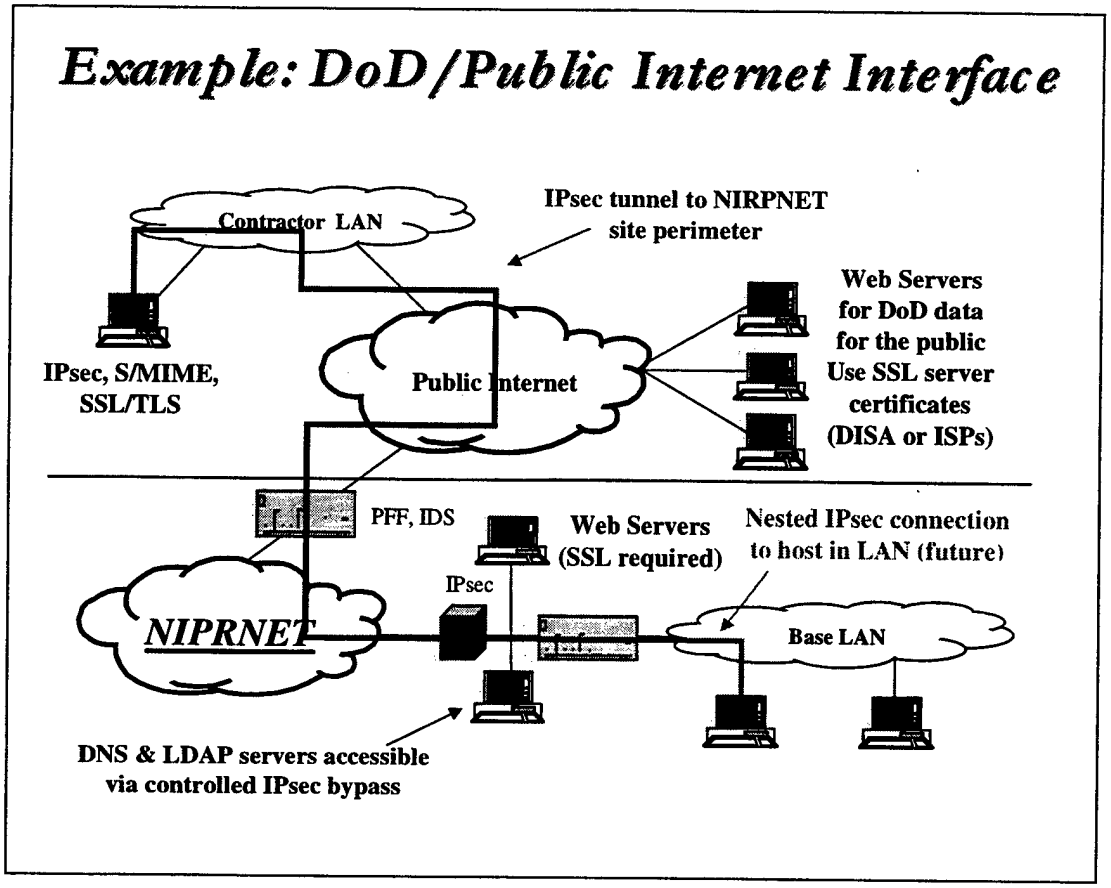

Figure 35. DoD/Public Internet Interface

Figure 35 illustrates the suggested interface between NIPRNET sites and the public Internet. In this approach, all DoD data that is releasable to the general public should be housed on web servers that *are outside of* NIPRNET. This segregation keeps traffic associated with this data off of NIPRNET, avoiding potential congestion on NIPRNET due to "legitimate" access. It also minimizes opportunities for denial-of-service attacks against NIPRNET that masquerade as legitimate access to public Web pages. The web servers holding this data could be operated by DISA on behalf of all DoD activities, or could be outsourced to commercial providers, i.e., ISPs.

Contractors, universities performing DoD sponsored R&D, and other users authorized to access resources on NIPRNET must use secure protocols and employ individual certificates. For example, access to a web server at a NIPRNET site will requires SSL/TLS, with client certificates. E-mail will be protected using S/MIME. The assumption is that each organization will establish a PKI and issue certificates to its employees in order to support these security protocols.

These requirements seem quite feasible. SSL/TLS is integrated into freely available browsers. IPsec is built into Windows 2000 and should soon be available in Sun OS and Linux. (After-market IPsec implementations are available for Windows 95 and 98.) Access to web servers behind the enclave IPsec device makes use of SSL, which is bypassed by the IPsec device (when the destination is one of a set of selected web sever at the site). Most IPsec traffic to a site will terminate at the IPsec device, which enables local IDS examination of the traffic. However, a site

may authorize nested IPsec traffic for true end-to-end security where appropriate. S/MIME e-mail (with triple wrapping) from approved sources is protected all the way to the recipient, while other e-mail is subject to scrutiny at the SMTP server, i.e., attachments will be scanned for viruses and some types of attachments may be prohibited.

Many organizations have, or have plans to establish their own PKIs. Small scale CAs are either free, i.e., Windows 2000, or inexpensive, i.e., the Netscape Certificate Server (which costs about $1,000). The major costs of instituting an organizational (local) PKI are administrative, not capital. Thus it does not seem unreasonable to mandate that organizations doing business with the DoD establish a PKI for secure communication purposes. (The DFAR might explicitly authorize some of the costs of PKI establishment and maintenance as chargeable to DoD contracts.)

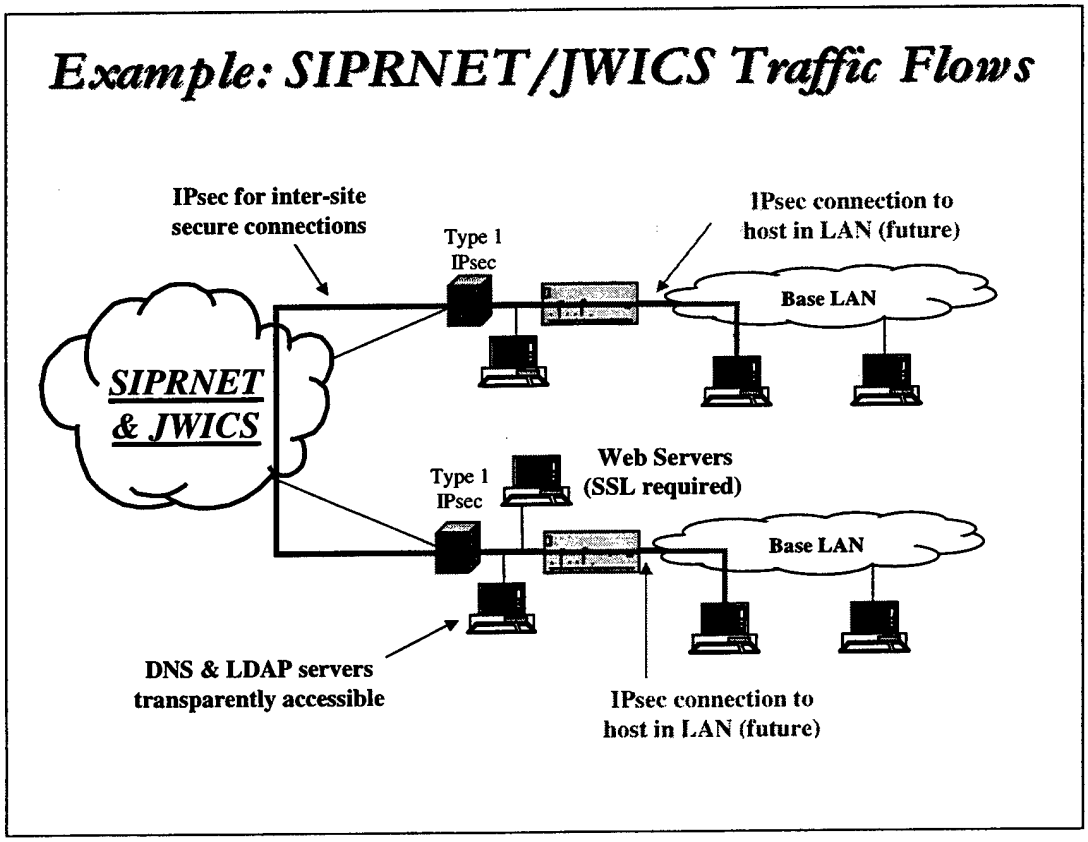

Figure 36. SIRPNET/JWICS Traffic Flows

Figure 36 illustrates connections between users or between a user and server at two SIPRNET or JWICS sites. The Type 1 IPsec devices at the perimeter of each enclave provide confidentiality, authentication, integrity, and access control for all traffic, transparently. Because all inter-enclave traffic is protected by these devices there is not need to bypass traffic. (Special provisions may be required for dual-homed enclaves that need to exchange BGP traffic with routers in the SIPRNET or JWICS backbone.) Thus all servers, including e-mail, DNS, and web servers are "behind" these devices. Each site is responsible for managing the access control lists in the Type 1 IPsec device(s) at its enclave boundary.

When a user in one enclave needs to send or receive data to or from a computer in another enclave, if further protection is required (in support of FGAC), IPsec, SSL/TLS, or S/MIME is employed. For example, all web server access is SSL/TLS protected. S/MIME is used to protect all e-mail. IPsec is employed when accessing other systems where SSL/TLS is not appropriate, i.e., where UDP (vs. TCP) is employed for transport.

Guards, which provide controlled upgrade/downgrade connectivity to networks at different sensitivity levels, are located in enclaves, and thus communication with them follows this same paradigm.

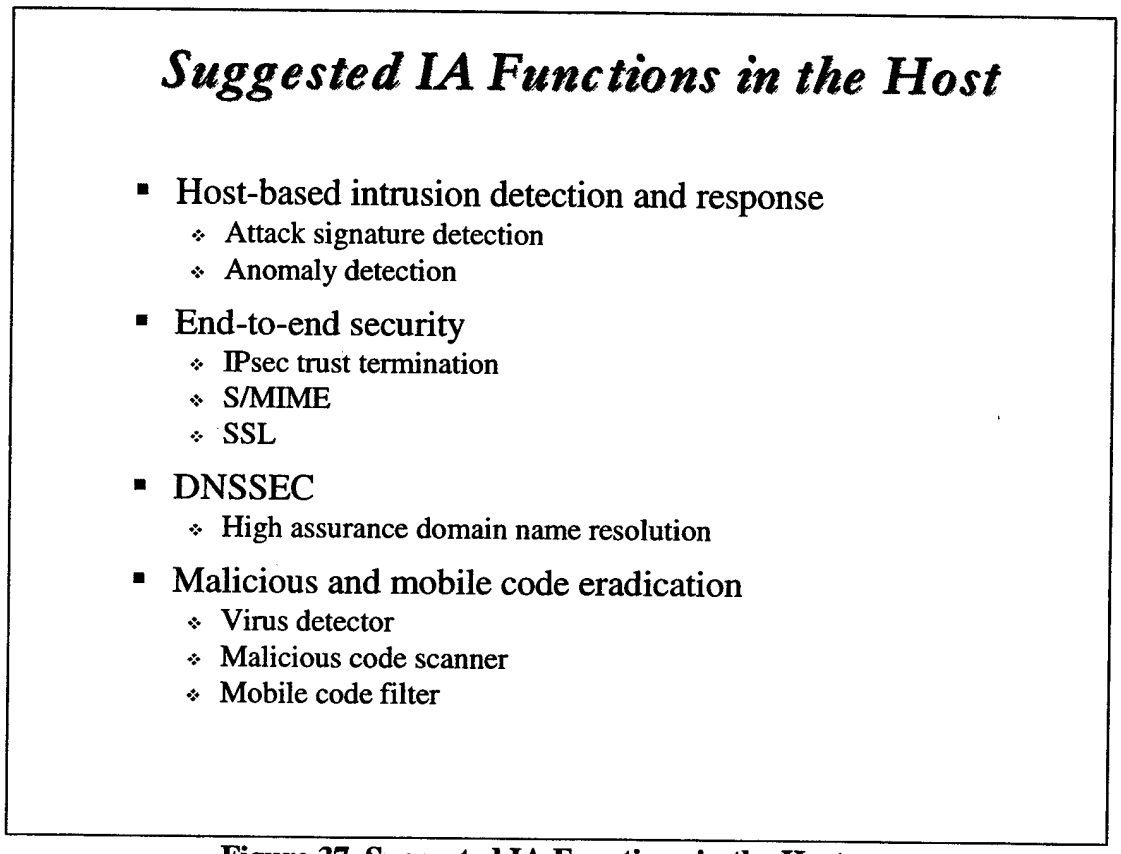

Figure 37. Suggested IA Functions in the Host

In addition to boundary protection provided by the DiD architecture, there are a variety of functions that should be employed to defend the hosts in the GIG. The panel suggests that these be used in all DoD common-user networks, including NIPRNET, SIPRNET, and JWICS.

IPsec, SSL, and S/MIME should be used for end-to-end cryptographic services such as confidentiality, authentication, nonrepudiation, integrity, and access control. A secure DNS resolver should be deployed with secure DNS servers to provide high assurance that a domain name is resolved correctly. A virus scanner, malicious code detector, and mobile code filter should be used to strip any attachments or content violating mobile code policies established within an enclave.

In keeping with the defense-in-depth strategy, host-based intrusion detection and anomaly detection tools should also be deployed. When IPsec is used all the way to the host, the host has the only opportunity to apply serious IDS scrutiny to incoming packets. Since the hosts will experience relatively small data rates, the IDS can be tuned to high levels of sensitivity. The host-based IDS should communicate alert information to other enclave IDS services which can correlate data from network IDS and other host-based IDS deployed in the enclave to obtain a more accurate enclave-wide view of intrusive and other network activity. Signature-based IDS should be kept up-to-date and output monitored by the enclave security administrator.

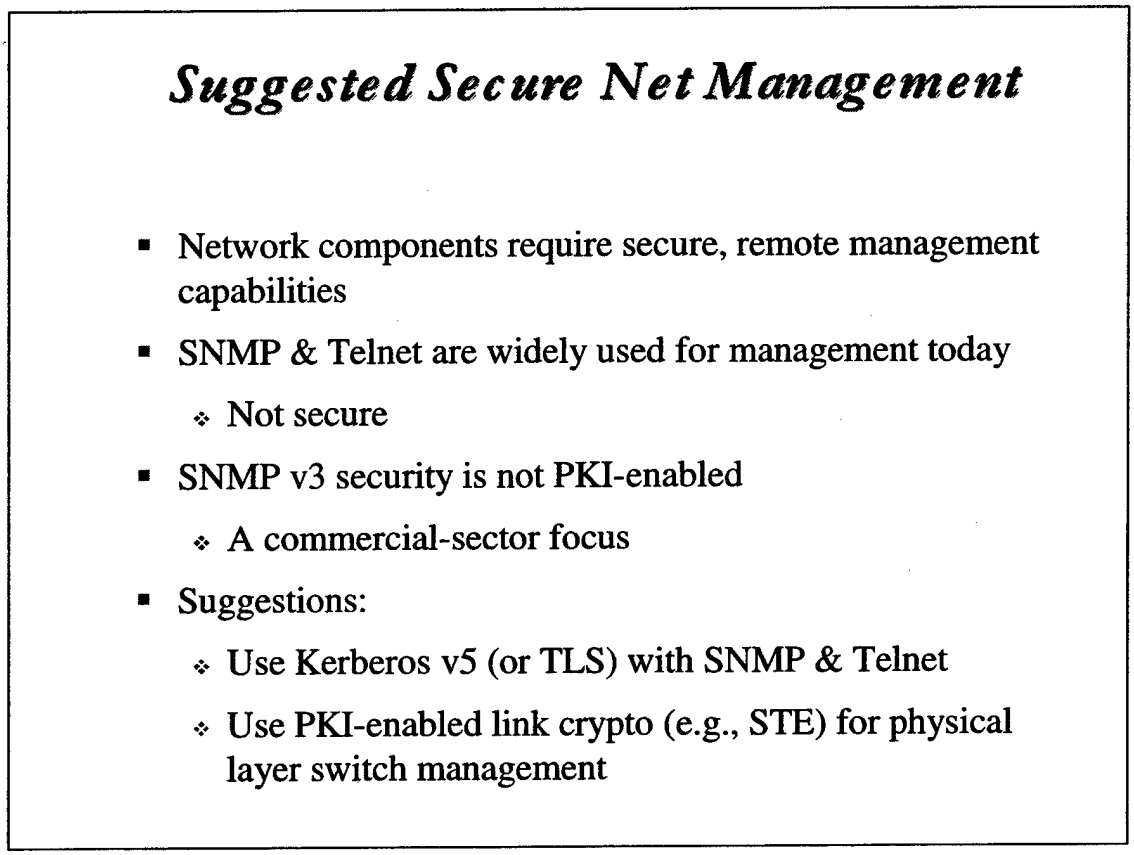

Figure 38. Suggested Secure Net Management

Today, most layer 3 and above network components are managed remotely using a mix of SNMP and Telnet, although some offer web interfaces as well. Simple Network Management Protocol (SNMP) v1 offered no security, and so was used only for getting information from managed devices (for reading MIBs, but not for modifying them). Telnet, even if used with plaintext, reused passwords, was often employed. SNMP v2 had static, symmetric key cryptographic security added, but was not commercially successful. SNMP v3 has improved security services, but still uses manually distributed, symmetric keys. This is not consistent with our proposed use of PKI for user authentication and authorization everywhere else in the GIG. The use of Kerberos for SNMP v3 security has recently been proposed. Version 5 of Kerberos supports X.509 certificates and thus may provide a means of PKI-enabling SNMP v3.

Telnet, secured by Kerberos, is available and used today in some products for secure SETs, and web interfaces for management can make direct use of SSL/TLS. Telnet can also be secured using SSL/TLS.

For the most part, the GIG will not own or directly manage circuits, but when it does, the circuit switches, SONET switches, and the like often require or offer out-of-band management interfaces, i.e., via the PSTN. These interfaces should be secured via link crypto devices that make use of PKI technology, to provide authenticated, integrity-protected, and confidentiality-secure channels. Some such devices are commercially available, and one can use STU-IIIs (or, preferably, the next generation technology, STEs) in this fashion as well.

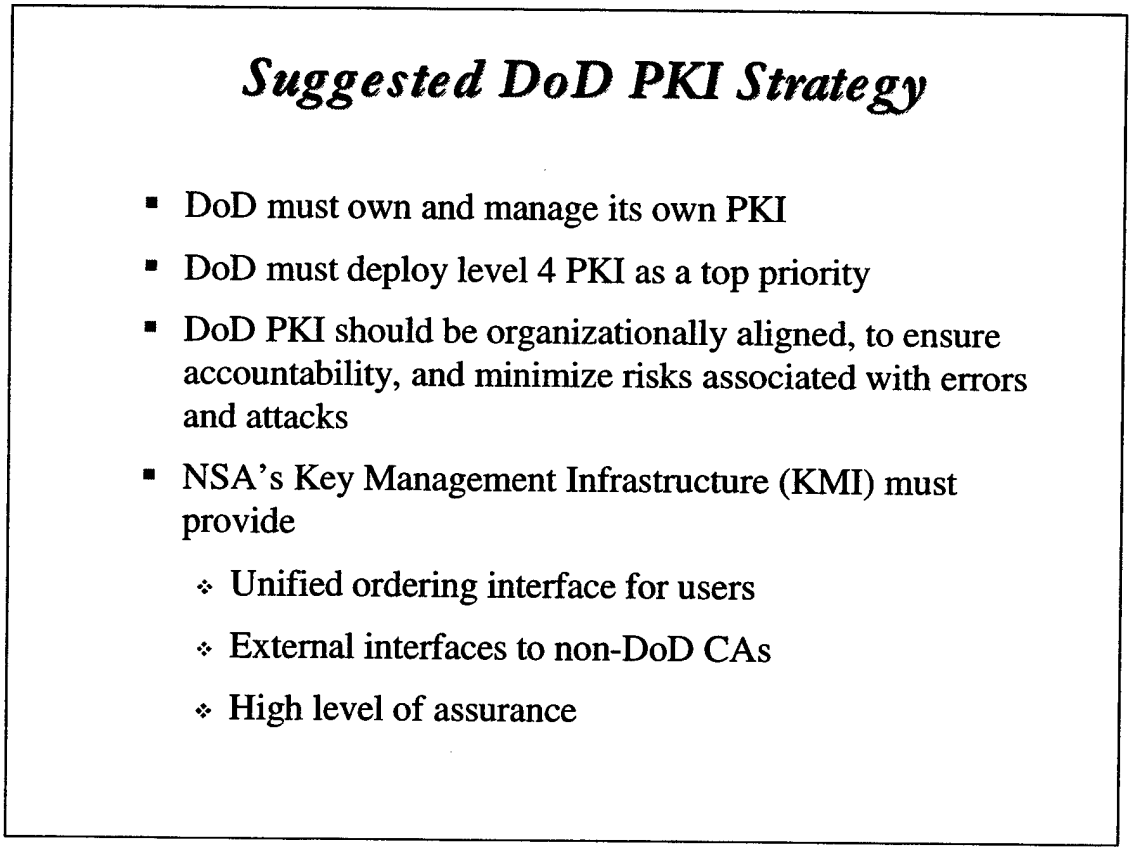

Figure 39. Suggested DoD PKI Strategy

As suggested in Figure 39, DoD should focus on deployment of level 4 PKI. If this requires delaying Common Access Card (CAC) deployment that delay should be tolerated. A PKI is a central element of system security and subversion of a PKI can undermine most layers of a defense-in-depth scheme. Thus it is critical that DoD take responsibility for its own PKIs. The DoD should *not* make use of commercial CAs, although the DoD PKIs must interoperate with commercial PKIs, i.e., to support authentication of DoD contractors.

The DoD PKI should be aligned with organizational boundaries and should use alternate (subject/issuer) name extensions to incorporate DNS names and RFC822 names in order to facilitate native support of security protocols such as S/MIME, IPsec, and SSL/TLS. The NSA

key management infrastructure (KMI) could provide a suitable infrastructure for these requirements. It is critical that certificates be issued along organizational boundaries, to constrain the damage that might result from local security compromises. For example, it must not be possible for an Army CA to issue a certificate that purports to be for an Air Force employee. Current plans for the KMI do not necessarily adhere to this principle and should be modified accordingly. Also troubling is the so-called "bridge CA" concept, developed for inter-organizational cross certification in the federal PKI. Several important PKI security features do not operate properly when a bridge CA is part of a certification path. A bridge CA should be used *only* to facilitate acquisition of public key certificates of other organizations, so that local security administrators can issue cross certificates directly to the other organizations with which they need to interoperate.

DNSSEC is a PKI-like system that provides secure name/address translation support for most Internet protocols. The DNS is global in scope and thus the DoD should encourage widespread adoption of DNSSEC. Within the DoD, high assurance (cryptographic) technology should be employed to protect DoD domains, i.e., the DoD should implement DNSSEC for the .mil and .sml domain and sub-domains.

Directories are essential for widespread deployment of e-mail security (S/MIME), because a sender must retrieve the certificate for a recipient prior to encrypting a message. IPsec and TLS do not rely on directories, except for certificate revocation status information. LDAP is the current, commercial directory interface standard; it is a rapidly evolving standard, of growing complexity. Security for directory access, i.e., via TLS, is improving, but implementations will probably remain significantly vulnerable for some time. The DoD must ensure that the directory systems it deploys make use of the best available load sharing, replication, and security.

Page 928 of 3957

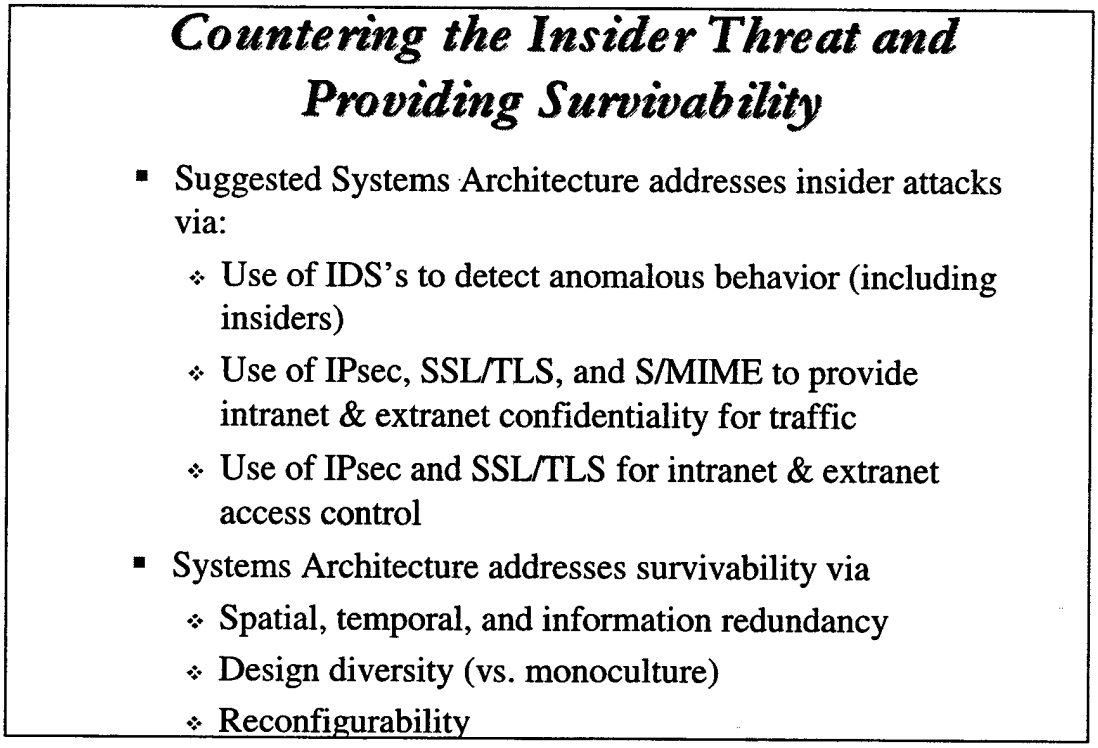

Figure 40. Countering the Insider Threat and Providing Survivability

The panel's suggested system architecture and DiD address the insider threat previously discussed. Intrusion detection systems deployed in enclaves, on user workstations servers and other devices, monitor activity to detect inappropriate (i.e., suspicious) behavior by authorized personnel, as well as attacks by outsiders, which should provide a deterrent to some class of insiders, as well as aid counter-intelligence efforts.

The security protocols cited above (IPsec, SSL/TLS, and S/MIME, level-4 PKI) support fine-grained access control to information in storage on servers and in transit. This fine-grained access control helps prevent a subverted insider from eavesdropping on communications inside enclaves and helps prevent insiders from gaining access to servers or to other enclaves without explicit authorization. Because all of these protocols make use of PKI technology for authentication, the resulting audit trails also help to detect and deter insider misuse.

Survivability is addressed through the use of redundant servers, access lines, and local interfaces (i.e., multi-homing), and via dynamic routing in common user WANs.

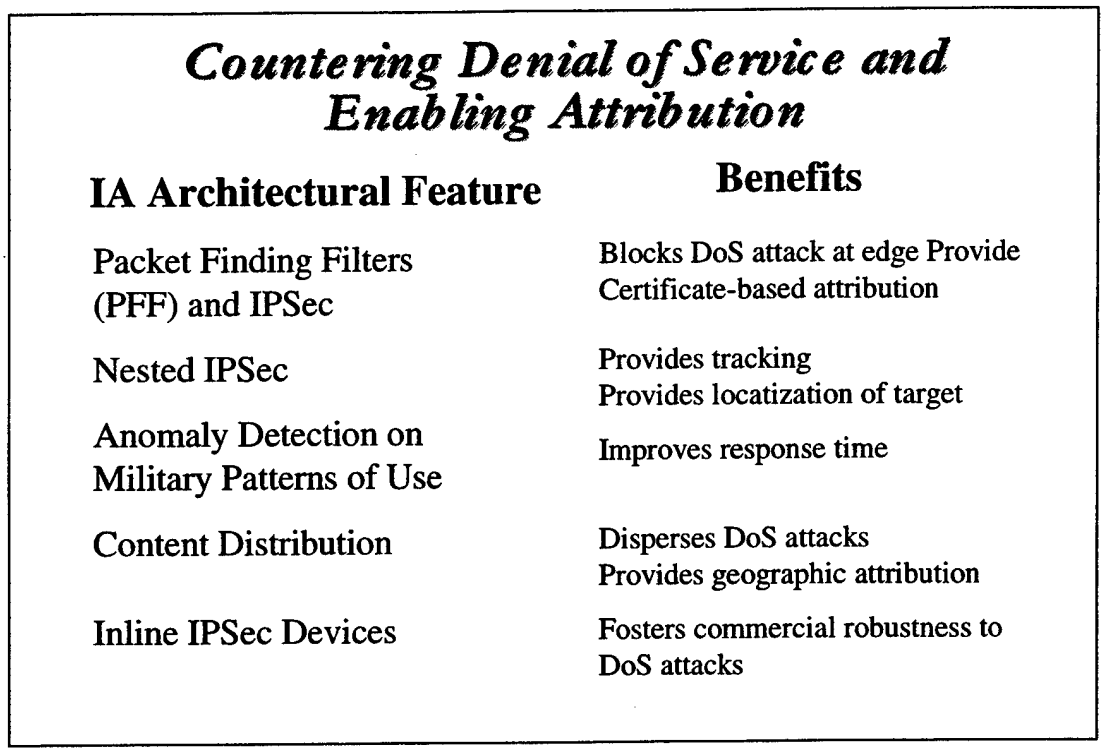

Figure 41. Countering Denial of Service and Enabling Attribution

In Figure 41, the panel suggests architectural elements that counter denial-of-service and provide partial ability to attribute attacks back toward their origins. The stateful packet-filtering firewalls installed at the boundaries should be configured to reject Internet Control Message Protocol (ICMP) echo and reply messages, and to throttle SYN messages to limit the number of half-open connections. Smurf attacks depend on ICMP echo reply (as well as other questionable mechanisms) that can easily be stopped at firewalls. Synchronization (SYN) floods depend on overflowing the fixed-length queues of TCP, so by throttling the number of SYNs allowed into a network, perhaps contingent on the completion of connections, one can limit the DoS potential at the firewalls.

There is a potential performance penalty associated with such throttling, but this can be managed. In the Feb 2000 distributed denial-of-service attacks, approximately 80% of the attacks were Smurf, and 15% were SYN floods. Thus approximately 95% of Feb-2000-style DoS attacks would be mitigated by present and suggested firewalls at the enclave boundaries.

The panel recommends the use of IPsec, which prevents denial-of-service within the enclaves. Further, future nested-IPsec implementations can counter denial-of-service and assist attribution by target localization and path tracking. The panel recommends research and development of networked IDS visualization tools for semi-automated sysadmin response, which would improve the time to response to a DoS attack. (It took days for sysadmins to identify the first DoS attack for what it was.) The panel also recommendation to employ anomaly detection can be configured to exploit known military patterns of use, and can trigger responses perhaps including dynamic user reauthorization. Content distribution networks, such as those run commercially by Akamai and Digital Island, provide additional mechanisms to counter DoS attacks. The static content of public DoD web sites can be replicated in a similar way. For public

Page 930 of 3957

DoD web sites using SSL server certificates to prevent web site defacement the current commercial offerings are inappropriate. Some content-distribution approaches provide a partial geographic attribution. Finally, the panel recommendation to support development of high-speed inline IP cryptographic device could foster widespread commercial IPsec use, initially in large multinational corporations. Together, the panel recommendations partially address denial-of-service attacks on the GIG and provide initial attribution capabilities.

4.4 METRIC SUGGESTIONS

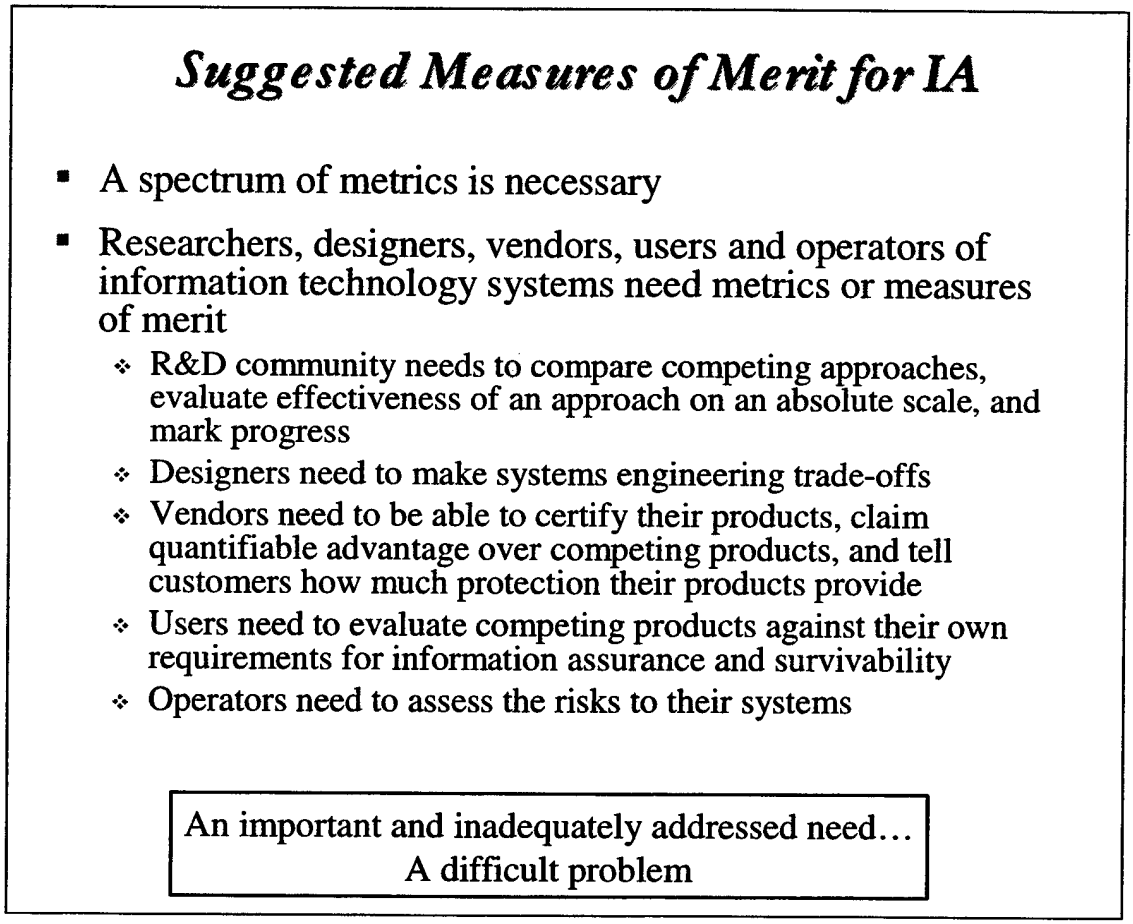

Figure 42. Suggested Measures of Merit for IA

Metrics for information assurance and surveillance architectures are an important and inadequately addressed need. Researchers, designers, vendors, and operators of information systems need a broad spectrum of metrics to achieve their respective objectives. From a systems perspective there is a need to develop metrics for technical-, system-, and mission-level evaluation. This development will require collaboration amongst technical, evaluation, and operator communities. A testbed is required to provide a means for measurement of system performance given different scenarios and related information traffic. The defense-in-depth systems architecture and metrics-measuring capability facilitate new capabilities for indications

and warning. Figures 42 and 43 provide a few examples of how the metrics may be utilized by different communities at different stages of the lifecycle of a system.

The research and development community must compare competing approaches, evaluate effectiveness of an approach on an absolute scale, and mark progress as a function of time. This paradigm of common metrics, validated training, and test data has proven to be extremely successful in areas such as speech, speaker, and language recognition.

Designers need to make systems engineering trade-offs. This is particularly true when attempting to trade complexity for performance.

Vendors need to certify products, claim quantifiable advantage over competing products, and tell customers how much protection their products provide. Metrics enable an Underwriters Laboratory (UL) approach to evaluating commercial products, i.e., common data, measurements and analysis. There has been progress on this front over the last 17 years, starting with the Trusted Computer System Evaluation Criteria (TCSEC) "Orange Book," progressing to the Information Technology Security Evaluation Criteria (ITSEC), and now the Common Criteria (CC) version 2. However, there are still questions about the viability of such security evaluation criteria, as noted in the recent National Research Council report, "Trust in Cyberspace."[7] Thus one should not expect that component evaluation will, by itself, "solve" the problems we face in engineering secure systems. Thus the approach described below, which emphasizes development of IA metrics for fielded systems, is critical.

Users need to evaluate competing products against their own requirements for information assurance and survivability. Operators need to assess the risks to their systems. Measures of merit or metrics for information assurance and survivable architectures is an important and inadequately addressed need.

---

[7] Trust in Cyberspace, Committee on Information Systems Trustworthiness, Computer Science and Telecommunications Board, Commission on Physical Sciences, Mathematics, and Applications, National Research Council, National Academy Press, Washington, DC 1999, Fred B. Schneider, Editor

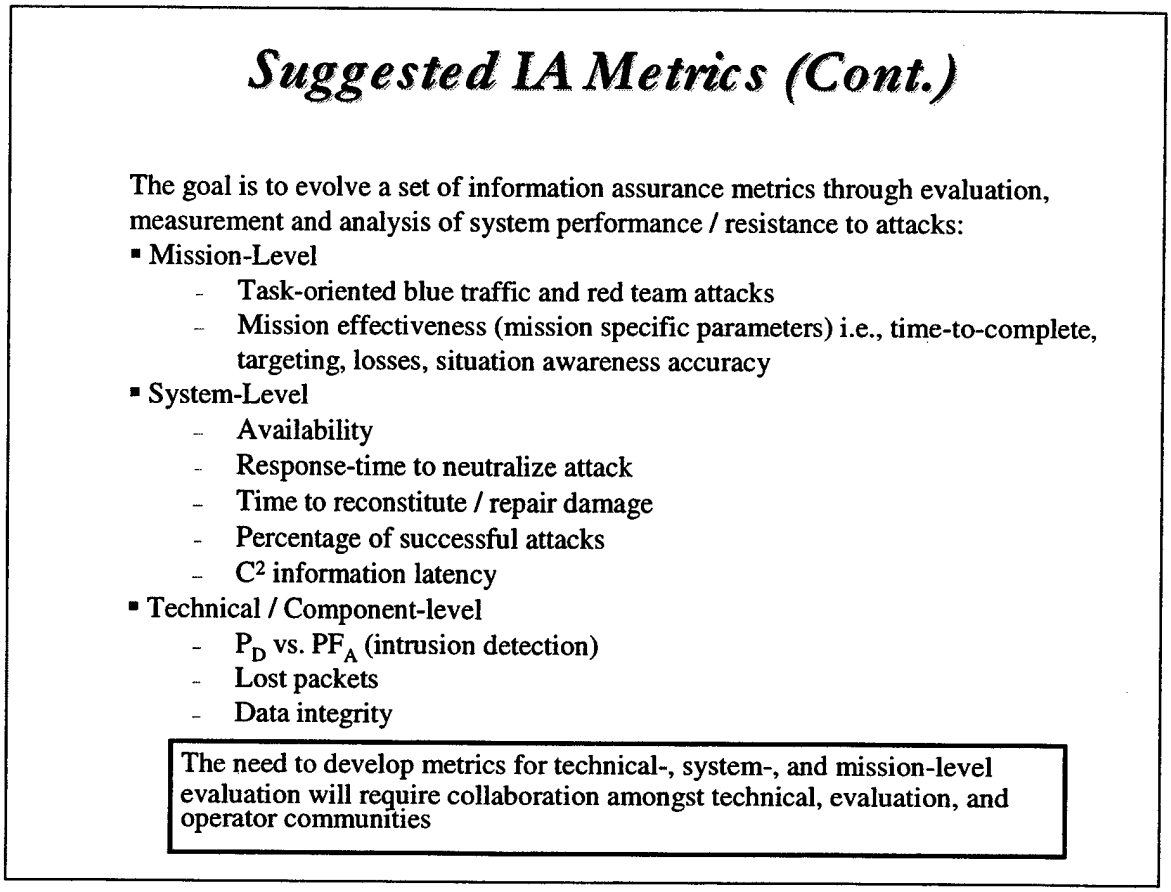

Figure 43. Suggested IA Metrics

The overall challenge, based on the architectural environment and an evolutionary experiment, evaluation, and analysis process, is to develop a set of information assurance metrics to measure system performance in the face of a wide-ranging set of attacks. At the mission-level, the metrics will involve task-oriented blue team operations and traffic and red team attacks to evaluate overall mission effectiveness. Mission level metrics would cover such topics as time-to-complete, targeting success, losses, situation awareness, timelines and accuracy, etc. Systems-level metrics are related to mission-level metrics but are finer grained and would cover overall system availability; response time to neutralize attacks, reconstitute and repair damage; percentage of successful attacks; and C2 information latency. At the technical and component level, suggested metrics include specific measurements of probability of intrusion detection vs. false alarms, to provide a basis for performance quantification. In addition, measurements of packet loss and data integrity and losses will provide a means for evaluating the overall performance of information systems. The relationship of measurements and performance at all levels will require collaboration amongst the technical, evaluation and operator communities.

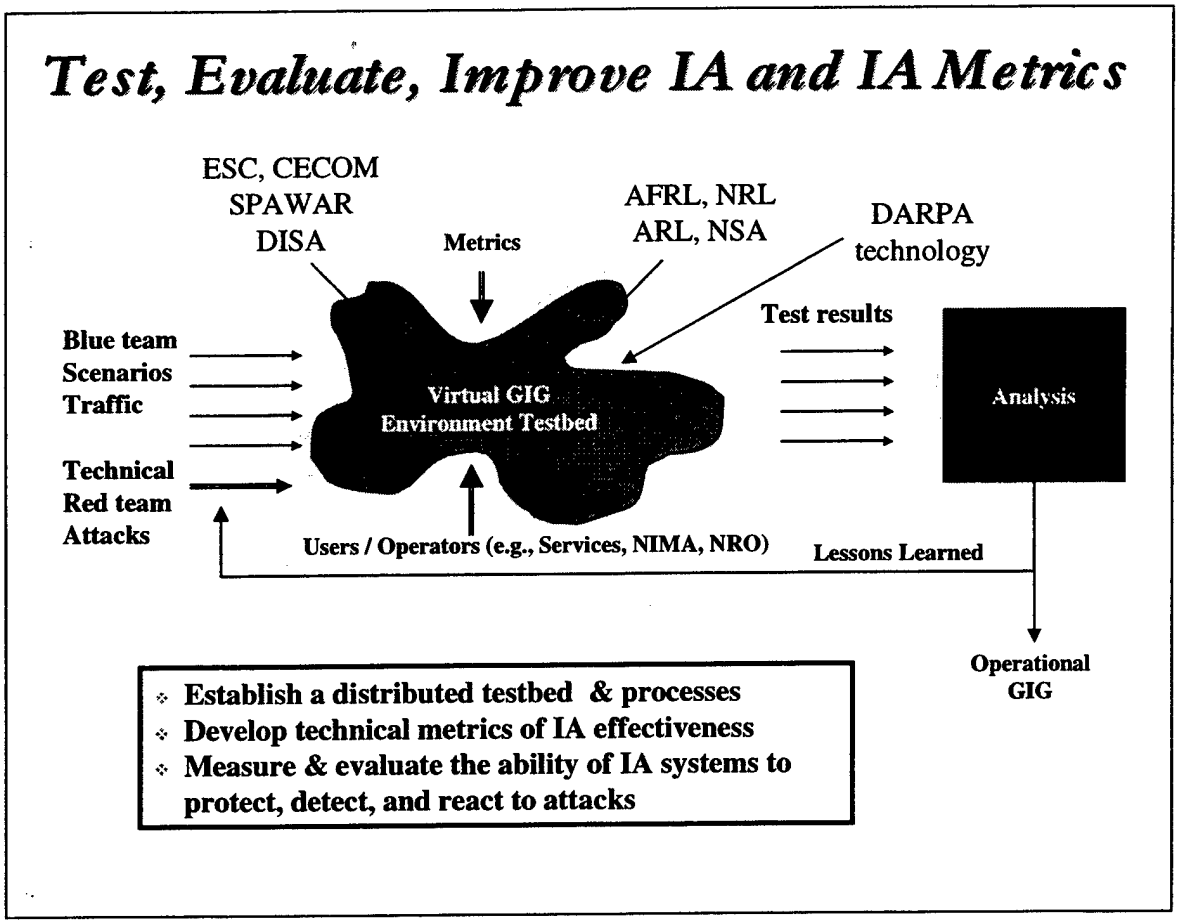

Figure 44. Test, Evaluate, Improve IA

The goal of information assurance metrics is to evaluate the ability of information assurance systems to protect, detect and react to attacks. As noted in Figure 44, to achieve this goal it will be necessary to establish a distributed testbed and processes for developing information assurance effectiveness metrics. Testbed nodes should be located at the U.S. Air Force Electronic Systems Center (ESC), U.S. Army Communications Electronics Command (CECOM), Space and Naval Warfare Systems Command (SPAWAR), Air Force Research Laboratory (AFRL), NSA, etc. The participants in the evaluation process will include research and development, evaluation, and operational communities (services and agencies). The testbed will provide a means for measurement of system performance in the face of red team attacks on blue team scenarios and related information traffic. The testbed will also serve as a primary means for DARPA information assurance technology insertion and evaluation. The metrics and measurements will evolve as results are analyzed and lessons learned are derived from the data. Lessons learned will be fed back to red and blue teams to refine and update strategies and will be used by developers to improve system defenses. Lessons learned will also be made available to the GIG architects and system engineers to improve IA.

This evolutionary process is essential to achieving a commonly accepted basis for measuring effectiveness of information assurance systems. The overall process represents a journey rather than a destination. Change is inevitable for offense, defense, infrastructure and particularly for COTS components. Measurement and evaluation of the ability of information assurance systems

to protect, detect, and react to attacks by adversaries must track these changes to achieve continued protection.

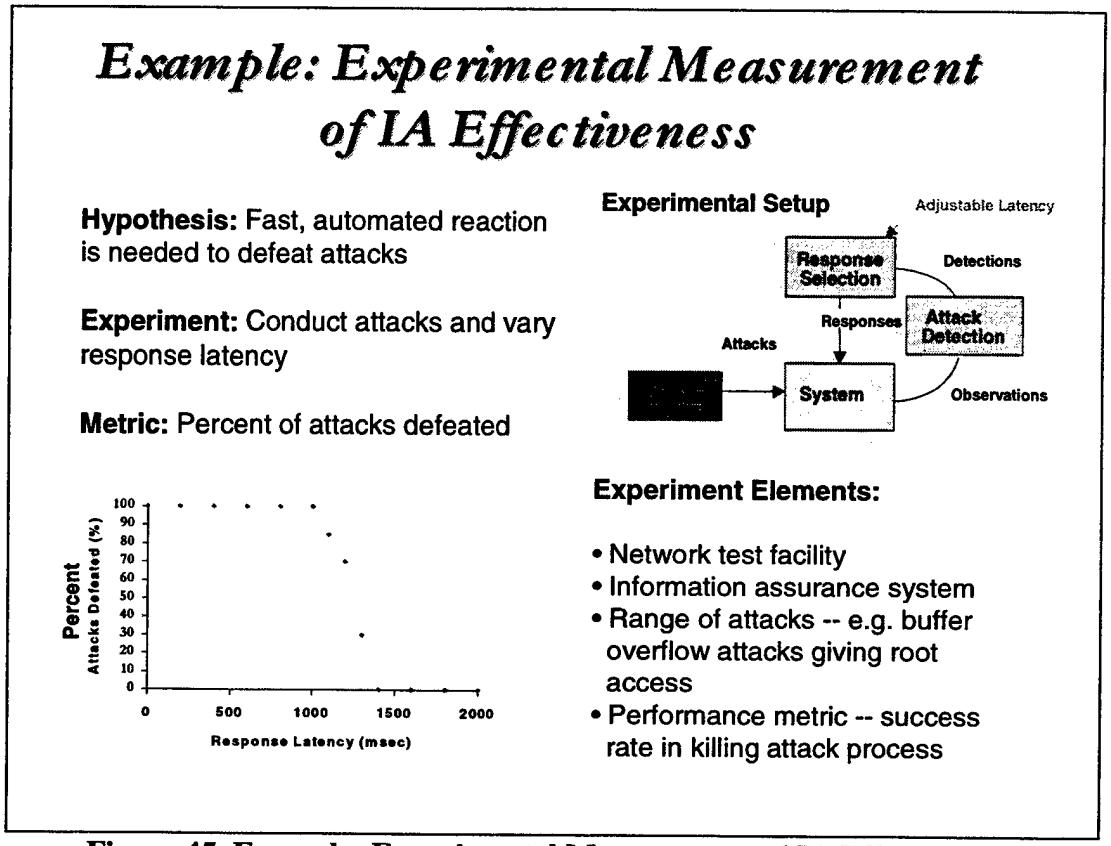

Figure 45. Example: Experimental Measurement of IA Effectiveness

Figure 45 is an example of a recent experiment to measure information assurance effectiveness. In this case, an experiment team including information assurance systems developers, and attack developers, was assembled to measure the effectiveness of an Information Assurance System response to detected attacks. The IA system has the capability to detect attacks and to respond in a variety of ways, i.e., by killing the attack process and removing attack scripts that may have been planted by an attacker. The latency of response time is an experimental variable – by waiting longer to respond, the IA system learns more about the attack, but might be too late to defeat the attack. The example set of attacks is built around "buffer overflow" attacks, where the attacker exploits weaknesses in the operating system to become "root," or "superuser."

An example of the experimental results is shown, where it is seen that a fast response (< 1 sec) defeats all attacks, while a slower response (>1.5 sec) fails to defeat any attacks. The experiment metric – percent of attacks defeated – is simple, but the experiment design, the team required, and the scenario development, illustrate the major components required for experimental measurement of information assurance effectiveness.

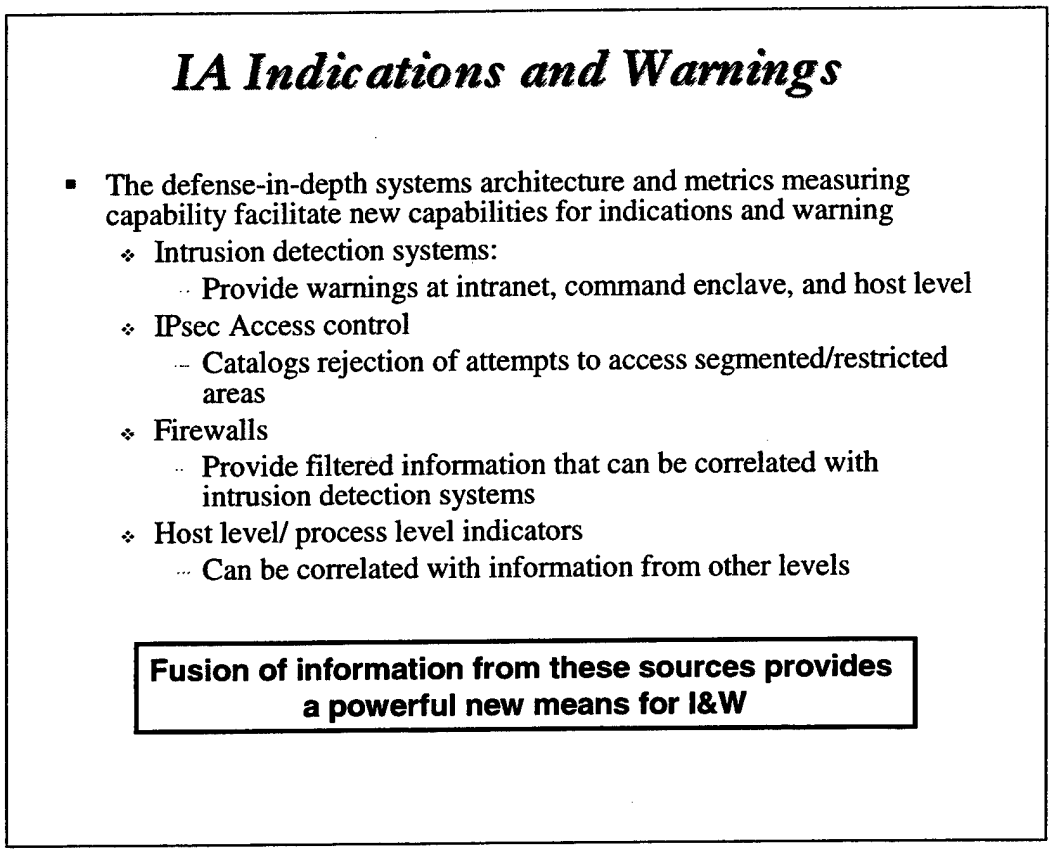

Figure 46. IA Indications and Warnings

As stated earlier, metrics for information assurance and survivable architectures are essential to achieving the broad spectrum of objectives of researchers, designers, vendors and operators of information systems. By implementing the defense-in-depth system architecture previously described, not only is system performance significantly improved, but a new set of system data (metrics) becomes available for indications and warning, as noted in Figure 46. The indications and warning data derive from a number of sources: 1) intrusion detection systems provide warnings at intranet, command enclave and host levels; 2) IPsec access controls provide data on illegal attempts to access segmented and restricted areas; 3) firewalls provide filtering information which can be correlated with data from intrusion detection systems; and 4) host-level and process-level indicators can be correlated with data from all of the above sources. The net result is that this multilevel, highly filtered data can be fused together to provide a powerful new means for facilitating indications and warning at multiple levels of the defense-in-depth architecture.

4.5 WIRELESS SUGGESTIONS

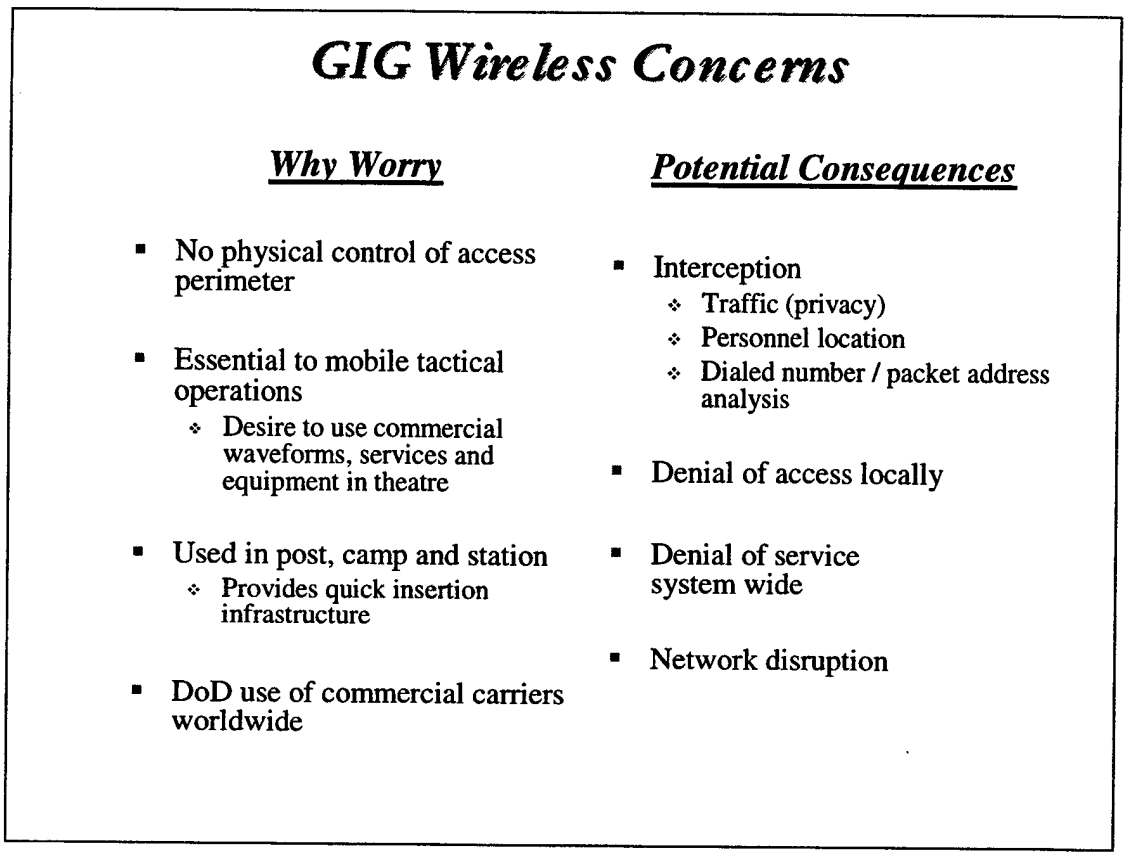

Figure 47. GIG Wireless Concerns

Since before WWII, wireless facilities have been part of military operations. They have been used in radio trunking throughout the upper echelons of the force and in tactical radio nets in the lower echelons of the force. From an information assurance perspective, wireless links merit special consideration, as noted in Figure 47, because they are not confined to a physical perimeter and can be observed from as far off as space.

Recognition of wireless observability and the Soviet radio electronic combat doctrine caused these links to be both encrypted and protected against jamming. In the last twenty-five years the tactical forces have procured a wide variety of secure radio systems. Wireless facilities will continue to enable mobile military operations. Recently, efforts to "digitize" the battlespace have demanded an increased bandwidth. Increased bandwidth systems will typically have shorter ranges and thus require "ad hoc" networks to move the data around the battlefield. As a result, networked communications will move further forward in the tactical area.

Projections indicate that data will be an ever-increasing part of mobile military operations, while the level of voice information will be relatively static. Consequently it can be expected that voice and data services will ultimately be provided above a common wireless/wired tactical Internet (the GIG). Thus the security of the wireless networking is essential to the performance of

the system. In the civilian world, the use of wireless has been rapidly exploding. Mobile personal communications systems, such as terrestrial cellular services and satellite-based services, represent large economic investments. They provide ubiquitous, near-global access to the public switched telephone network from small, inexpensive user devices.

JV2020 envisions similar universal, on-the-move, information access for the military. Similarly, there are a number of emerging fixed wireless systems in use for wideband data and video access to the home. These systems are commercially attractive because they can provide service with a minimal infrastructure. For the military they can also provide "instant infrastructure" in existing and deployed post, camp and station facilities. While the use of these commercial capabilities in the GIG is attractive, these systems will be subjected to attack and, if compromised, could have system-wide impact.

Passive interception and observation of links can provide information on user location, traffic content, called party, and pattern of use. Commercial providers are incorporating some forms of privacy in their systems to prevent well publicized eavesdropping and fraud. However, network signaling information is generally available and can be used to deduce information or attack the system.

Active intervention in a wireless system, either by jamming or the use of equipment to render a system "busy," can deny access to communications service in a geographic area. More sophisticated attacks can deny particular users, or user communities, use of wireless facilities. All mobile systems depend on some system level database to allow calls to find a user. Attacks on these databases, either outright or through exploitation of fraud prevention safeguards, can disable use of worldwide wireless facilities.

Finally, as discussed subsequently the exploitation of network control structure can cause failure of the entire network. There have been examples of such failures in commercial networks due to software defects, and similar scenarios can occur due to either induced misbehavior or the use of wireless links to introduce false control signals into the network.

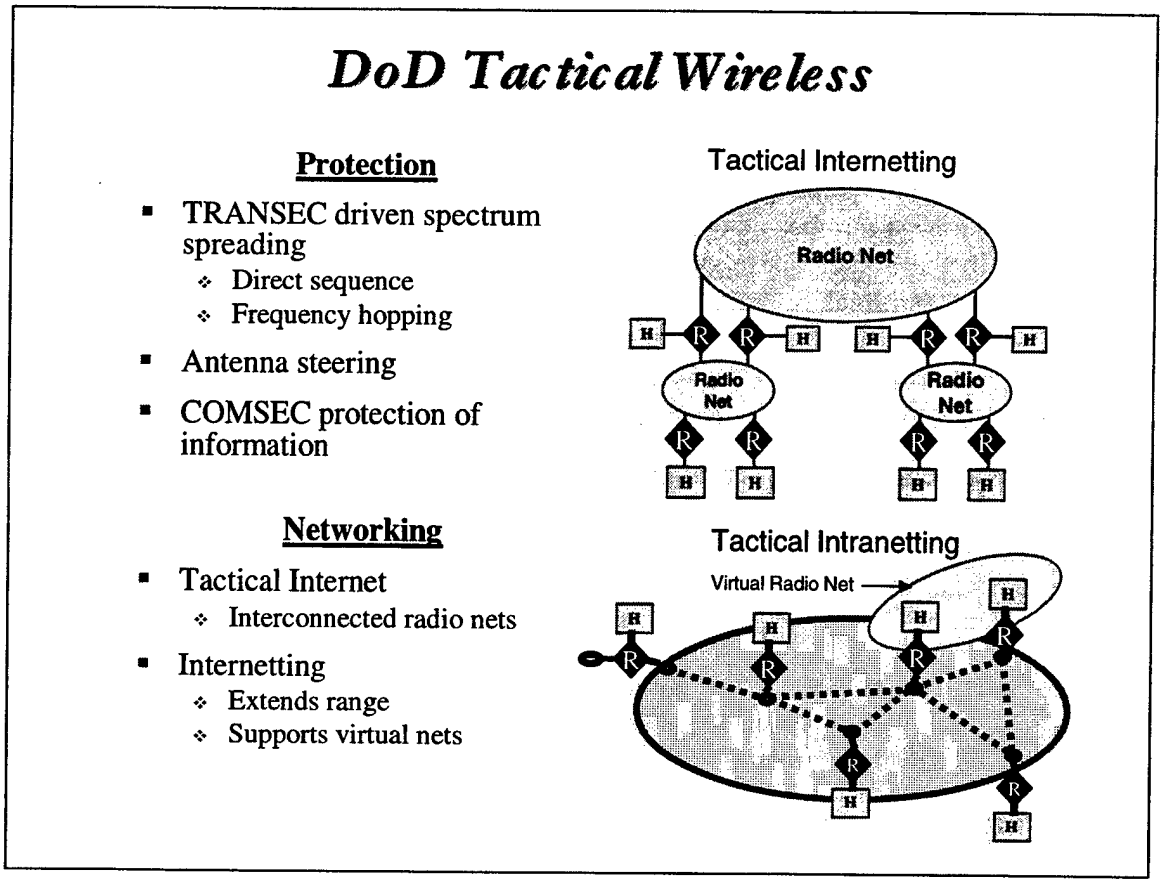

Figure 48. DoD Tactical Wireless

The DoD has led the technology development of a wide range of countermeasures to physical level attack on wireless links. These techniques may be employed individually or in concert. As noted in Figure 48, the standard technique for countering jamming is the use of spread spectrum techniques, which can be carried out with either frequency hopping or direct sequence spreading or a combination of both. The basic strategy common to both is to spread the information across a wide range of frequencies so that the jammer has to dissipate his power over the whole spectrum, while the desired user can exploit his private spectrum access information to reject the jamming signal. Adaptive antenna arrays have also been used to spatially reject a jammer. On most tactical radio links today the information is protected by COMSEC, typically embedded in the radio.

In the forward tactical area, radio nets have traditionally served single organizations. Recently there has been a desire to move digital information across multiple radio networks to achieve wide area connectivity and coordination. Initially this has been accomplished by using routers to interconnect secured radio nets, with the routers operating on decrypted traffic (system high). The Army's interconnected system is referred to as a Tactical Internet. Various exercises have shown that the routers are vulnerable to intrusion.

With a demand for higher bandwidth and robust connectivity, the emerging system concept is to separate the radio resource from the application. In this model the radios form an intranet where each radio handles all traffic in its area. The organizational communications are then achieved as a "virtual" net – above the radio infrastructure.

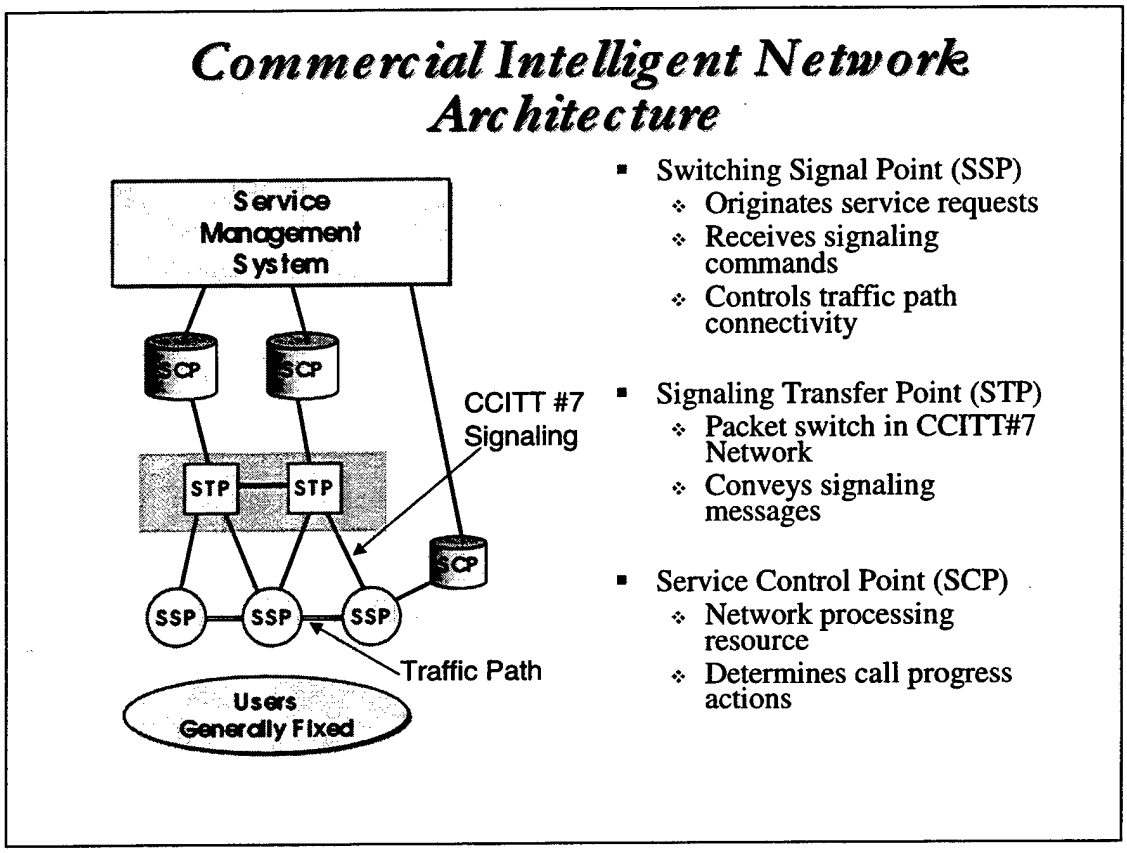

Figure 49. Commercial Intelligent Network Architecture

The GIG will use communications links in the Public Switched Telecommunications Network (PSTN). In the 80's, telecommunications providers developed and deployed a system architecture termed the "Intelligent Network" (IN) noted in Figure 49. This system architecture separated the signaling and control portions of the network from the interconnection process, so that advanced, revenue-producing, call-handling services could be provided. In this system model, a Service Switching Point (SSP) takes a subscriber's request for service and forwards messages through a network of Signal Transfer Points (STP). STPs are packet switches deployed throughout the telecommunications network. The originating SSP uses these messages to request information from Service Control Points (SCP) on how to respond to the service requests. Service Control Points (SCP) contains system-level data and processing services. In response to these requests, messages are sent to all switching points required to complete the response to the call request. The suite of protocols used to communicate these control operations has been standardized by the CCITT international standards body and is referred to as Signaling System #7 (SS7).

Access to the Signal Switching point is across an access facility. Traditionally this point has been twisted pair and considerable effort has been made to move ever-increasing data rates across this copper plant. In the 1980s, Integrated Service Digital Network (ISDN) was deployed to provide144 kbps to subscribers. More recently, higher rates have been made available through Digital Subscriber Line (DSL) technology.

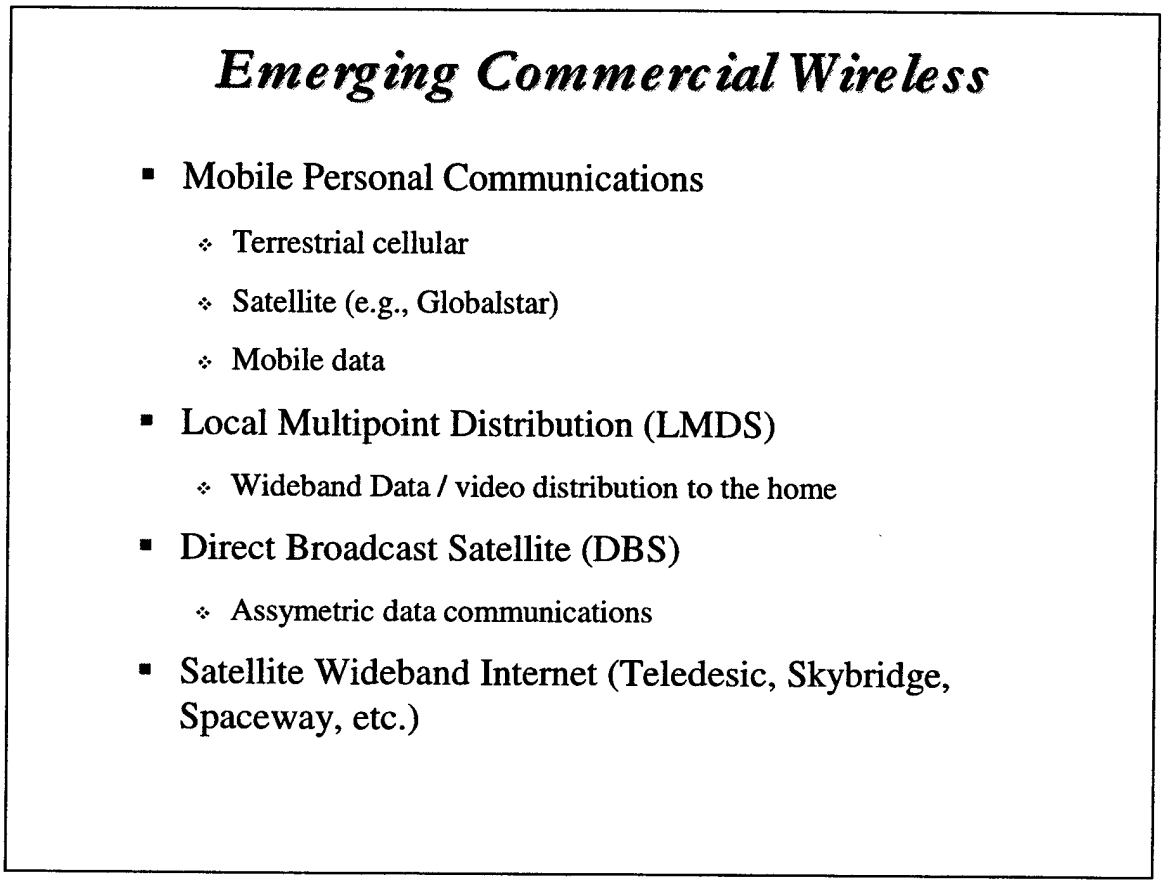

Figure 50. Emerging Commercial Wireless

The majority of the recent wireless explosion has been in the area of wireless access to fixed infrastructure. Cellular and personal communications systems (PCS) technologies, for example, use wireless access to deliver mobile users both switched voice services and narrowband data services. Low earth-orbiting satellite systems are in the early stages of deployment. These systems allow a user access to the fixed infrastructure across a wider roaming area where terrestrial base stations may not be available. In addition, as shown in Figure 50, there are high-speed wireless access technologies, such as the Multichannel Multipoint Distribution System (MMDS) and Local Multipoint Distribution System (LMDS), whose services are based on high-bandwidth radio segments in the spectrum at the 20 GHz frequency range. Emerging wireless access methods include Direct Broadcast Satellite (DBS), which employs Ka band satellite technology to distribute entertainment programming. DBS systems also offer asymmetric, two-way data transmission supporting high-speed data transmission to the user (from the satellite system) and low-speed data reception from the user.

Wireless wide area transport systems are planned to provide low-cost, high-bandwidth data and voice service to remote areas. These systems operate from either low earth orbit (Teledesic and Skybridge) or geostationary orbit (Spaceway). Most of these systems use the 20-30 GHz band, where wide bandwidths and small antenna apertures are possible.

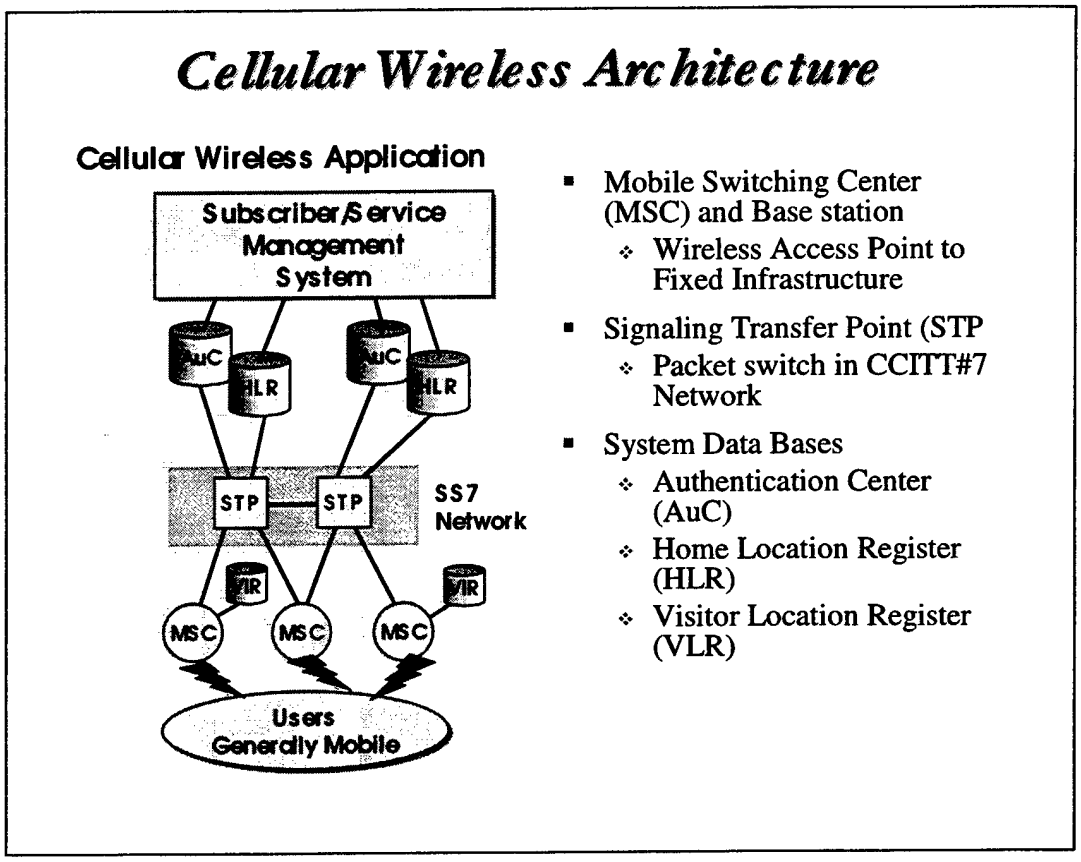

Figure 51. Cellular Wireless Architecture

The widest deployment of commercial wireless is in the mobile cellular system for which the system model is shown in Figure 51. Commercial mobile wireless services are furnished largely within the context of the Intelligent Network Architecture. The figure shows the standard wireless model. In the case of the cellular wireless application, the Mobile Switching Center serves the role of the Service Switching Point. The Mobile Switching Center and its associated Base Stations receive call requests from the mobile subscriber population. Call handling information is then requested from several key system databases, via the CC7 network. Messages are space-based on the (ANSI)-41 standard protocol suite.

These databases are: 1) the Home Location Register (HLR) which contains all of the information about the user and his current location within the system; 2) the Visitor Location Register (VLR) which contains information about all subscribers within an area served by a Mobile Switching Center (MSC); and 3) an Authentication center which validates the billing validity of the subscriber and accumulates the billing information. There may also be an Equipment Identity Center that holds information on particular devices in use within the system.

In the future, other processing resources are anticipated for new wireless-based services. One is a group of voice-controlled services, i.e., voice-controlled dialing, that allows the wireless user to control features and services through spoken commands. Another is a suite of services offering incoming-call options, where the subscriber can customize call-forwarding or call-blocking instructions for different types of incoming calls or receive calling name identification.

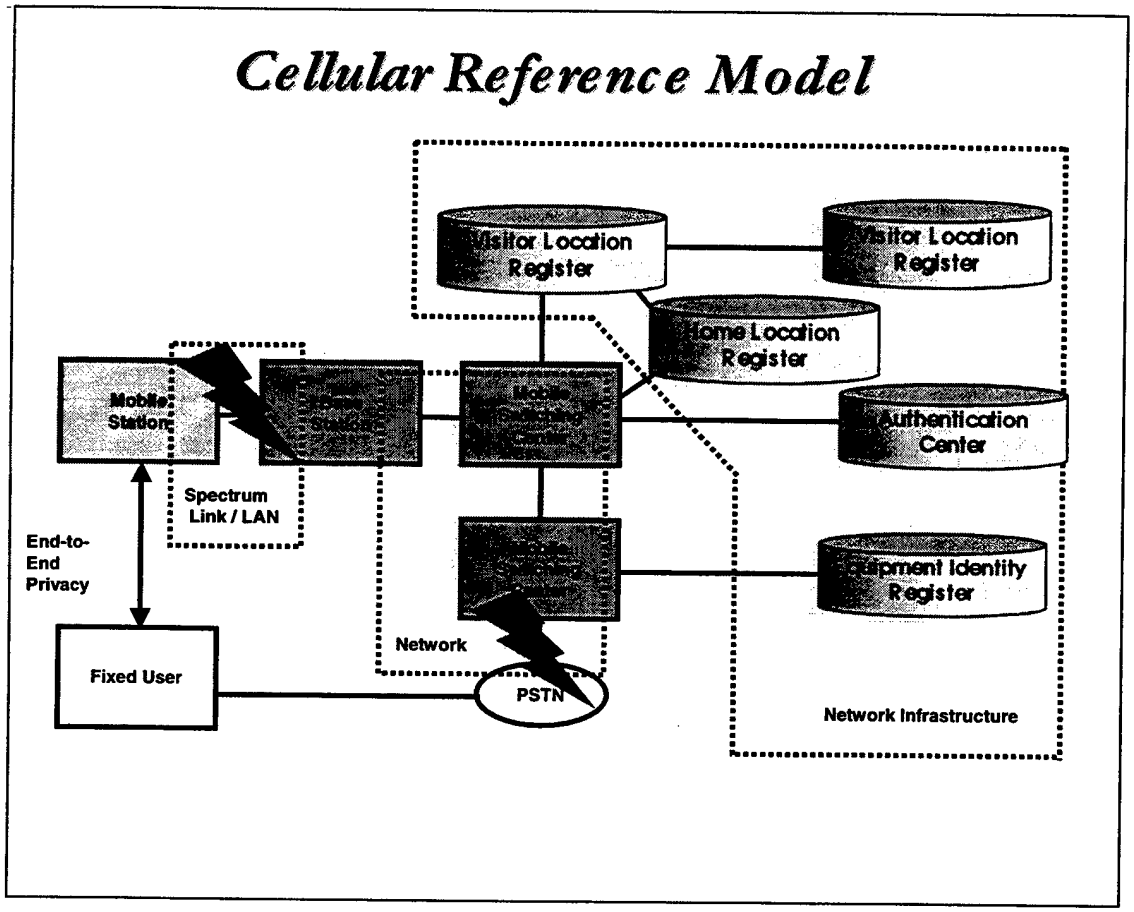

Figure 52. Cellular Reference Model

The next level of detail in the cellular communications systems model is presented in the cellular reference model shown in Figure 52. This figure illustrates the Base Station and Mobile Station that provide the subscriber access to the system. Base stations are sometimes split into one or more Base Transmission Systems (BTS) at a cell site and a Base Switching Center (BSC). Multiple BTS's can be served by a single BSC and a single Mobile Switching Center (MSC) can serve multiple BSCs.

There are several potential attack points in this system. The first is an attack on the cell spectrum or a wireless point-to-point link between a BTS and a BSC or a BSC and an MSC. The information that is accessible at this point primarily pertains to subscribers currently within the serving area of an MSC and thus has a more localized effect. Wider ranging network attacks can be mounted against wireless point-to-point links that move signaling and traffic information between system nodes, either SS7 messages to system databases or internal information such as

cell handoffs. Finally, classical cyber attacks can be mounted against any of the infrastructure databases, which are available through the SS7 network or increasingly through the Internet. While some protection mechanisms are in place, they likely will yield to a determined attack.

The key point to note is that while commercial wireless services may give the appearance of infrastructure independence, they are in truth a vulnerable extension of a vulnerable infrastructure.

Utilization of Countermeasures

Threatened Area	Available Countermeasure	Military	Commercial
Spectrum Access	Waveform TRANSEC Spatial filtering	AJ LPI LPD Strong TRANSEC	Multiple Access Objective uses Weak TRANSEC Some Spatial filtering
Link	COMSEC	COMSEC – Type 1	GSM Weak
Network	IPSEC Intrusion Detection	Link Protection Only	Minimal
Infrastructure	Encryption Access Contol Intrusion Detection	Access Control	Access Control
End-to-End Privacy	ETE COMSEC	Selectively	CONDOR

Figure 53. Utilization of Countermeasures

A number of countermeasures are classically available to attacks mounted at different points in the composite system, as indicated in Figure 53. Attacks in the radio frequency spectrum are the most familiar threat to the military user, and there are a variety of techniques for countering them such as random waveforms driven by high quality Transmission Security (TRANSEC) and spatial filtering of jammers by adaptive antennas. Although commercial wireless systems employ similar waveforms (GSM uses frequency hopping and IS-95 uses spread spectrum), they are designed to combat interference from other users and provide no margin against jamming. Additionally, these systems are designed for easy access.

Tactical military systems also typically protect each link with strong encryption, but only some commercial wireless systems employ any encryption, and that encryption is weak. Above the link level neither system has much protection. The tactical internet operates its routers at system high security level, while commercial systems employ rudimentary protection if any.

End-to-end Type 1 confidentiality is being provided through the NSA CONDOR program that is making commercial wireless available with embedded strong encryption.

4.6 GIG IA SUMMARY

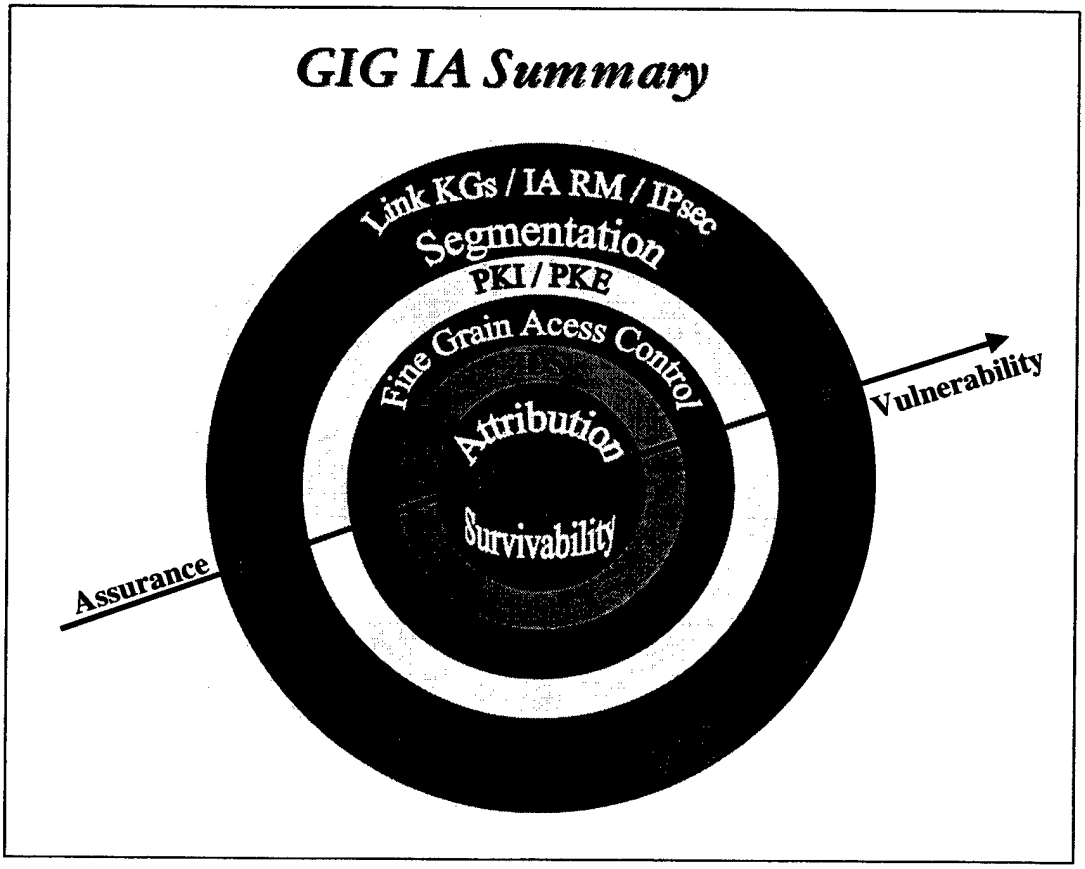

Figure 54. GIG IA Summary

Figure 54 provides a summary of the panel's suggestions for GIG IA. As we noted, the Global Information Grid is the underlying infrastructure to support information superiority for JV2020. The implementation of the GIG is one of the significant events that occurs once every decade or two. The architecture that is designed today will impact the DoD in the next decade or more. To meet this challenge, the panel has identified a layered architectural approach for providing information assurance to the GIG by pursing a disciplined architectural approach:

- Link encryption at the physical layer
- ISO-like reference model with commercial protocols, i.e., IPsec for end to end protection

- Segmentation of DoD from Internet, and segment by classification and enclaves
- Adopt PKI/PKE
- Use fine-grained access control of computers and communication resources

In addition to the architectural layers, the approach also includes use of correlated multi-layered IDS data (i.e., at common user, command and host levels) as inputs to intelligence-enabled tracing systems and modus operandi detectors. Attribution is facilitated by highly filtered data for signal-to-noise enhancement and IPsec for path tracing and target localization. The approach of the layered defense, combined with measurement, rapid response, and attribution, results in significantly reduced vulnerability and dramatically improved GIG information assurance.

Page 947 of 3957

CHAPTER 5. RECOMMENDATIONS

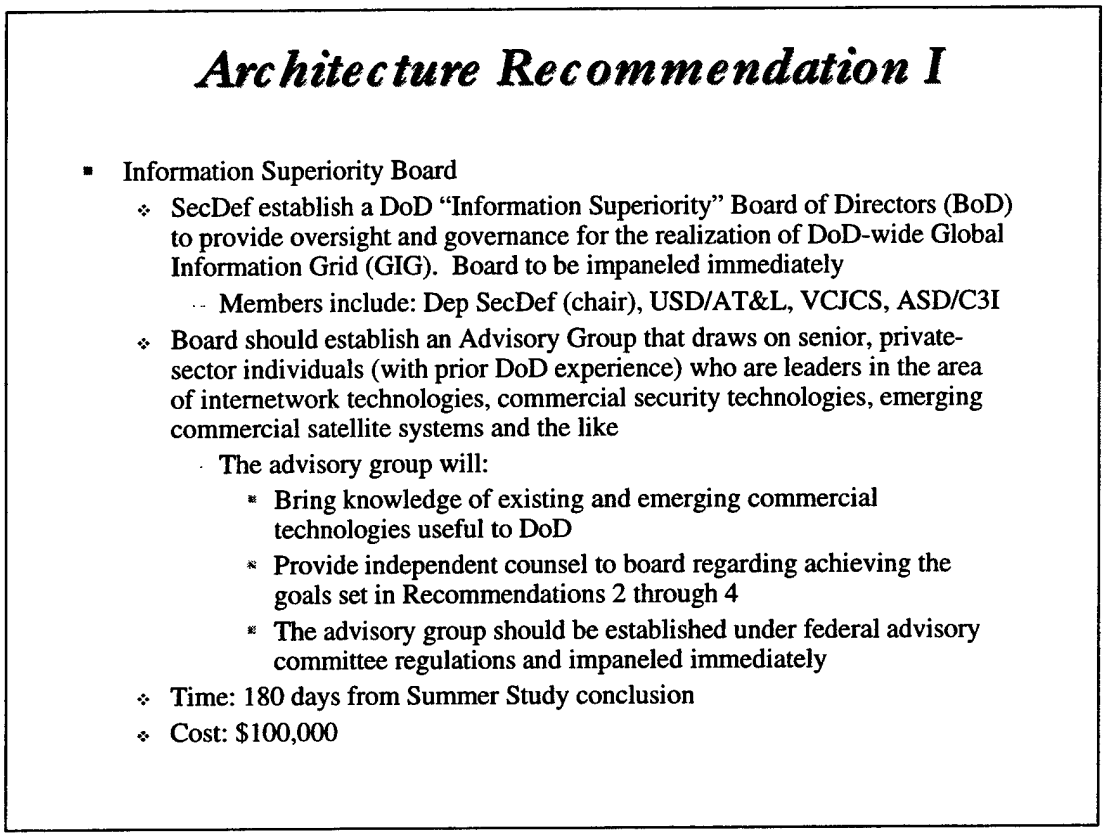

Figure 55. Recommendation I—Information Superiority Board

Consistent with its findings that under current organization (see discussion specifically associated with Figure 25), methods, and procedures the DoD is unlikely to realize a measured, consistent, and effective approach to creation of a Global Information Grid (GIG), the panel recommends the formation of a *DoD Board of Directors for Information Superiority.*

The Secretary of Defense should impanel the Information Superiority Board immediately, with membership consisting of the Deputy Secretary of Defense (as chair), the Undersecretary of Defense (Acquisition Technology and Logistics), the Vice-Chair of the Joint Chiefs of Staff, the Assistant Secretary of Defense (Command, Control, Communications, and Intelligence), and the Director of Central Intelligence.[8]

It is further recommended that the Information Superiority Board create an advisory group under Federal Advisory Committee regulations (or as a permanent DSB Panel) consisting of senior private sector IT leaders. The Advisory Group's purpose would be to provide the board with up-to-date knowledge of current and emerging commercial information systems, services,

[8] Reference: Defense Science Board Report on *Tactical Battlefield Communications*, February 2000

Page 948 of 3957

and network technology of potential use to the DoD in the realization of its Global Information Grid. It would also offer experience-based advice from industry as to the best technical and management methods for creating such an infrastructure.

The advisory group should consist of recognized industry experts in inter-networking technologies, commercial information and network security technologies, emerging information transfer technologies and systems, and other commercial activities such as standards development, infrastructure development, and the like. The advisory group charter should also ensure that the group provides independent assessments and counsel to the Information Superiority Board concerning the achievement of the goals and objectives set forth in panel recommendations that follow.

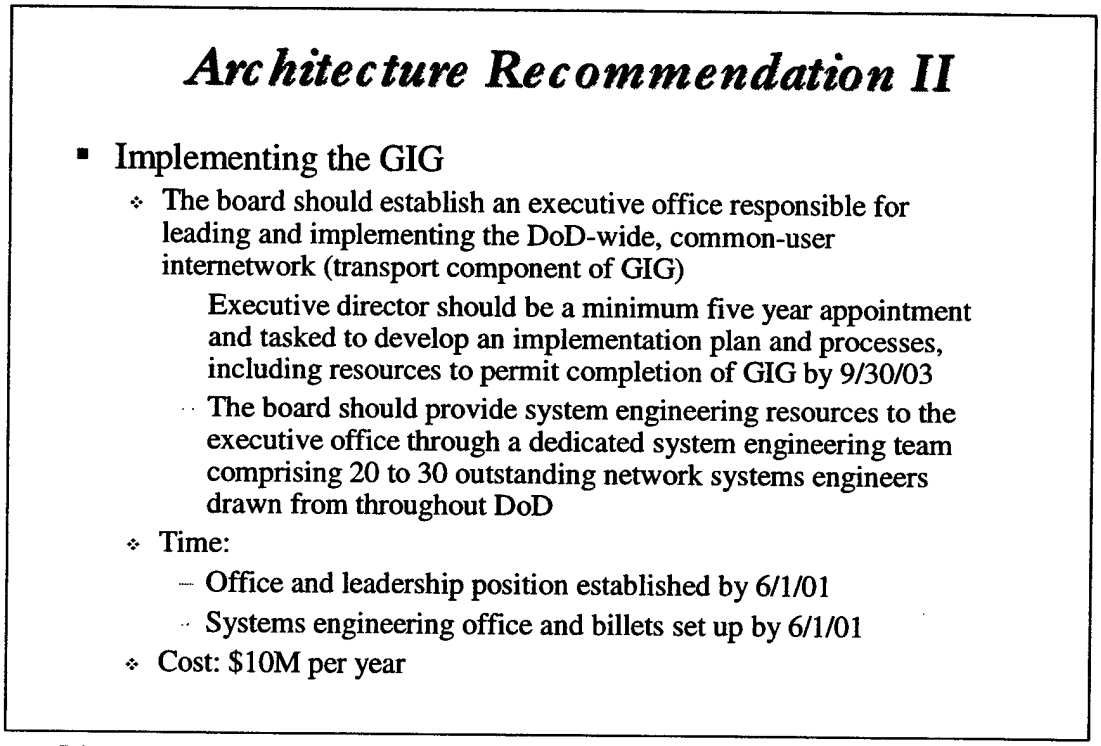

Figure 56. Recommendation II—Executive Director and GIG Implementation Process[9]

Placing the proper emphasis on GIG implementation and ensuring adherence to the policies established in accordance with the previous recommendations requires continuous oversight. It is therefore recommended that the Board of Directors for Information Superiority create, by 1 June 2001, an executive office responsible for leading the implementation of the DoD-wide common user internetwork on behalf of the board. The executive office director should be a senior DoD leader appointed for a minimum of five years. The executive director should be provided programmatic oversight for all DoD C4ISR systems acquisitions (including those procured by the services) and through this oversight ensure that all such systems are

[9] Reference: Defense Science Board Report on *Tactical Battlefield Communications*, February 2000

interoperable within and as part of the GIG. It would be the executive director's primary responsibility to deliver the GIG.

Several additional, more specific actions needed to accomplish the GIG objectives follow:

1. The executive director should be tasked to develop a GIG implementation plan, to include technical milestones, measurable interim goals, and an estimate of the resources necessary to complete transition and realization of the GIG by 30 September 2003.
2. The board of directors should provide manpower billets for a system engineering team to support the Executive Director. A cadre of 20 to 30 outstanding system engineers with backgrounds in Internet telecommunications and security technologies should be selected from throughout DoD. These individuals must be deep technically and visionary in their system engineering skills. This system engineering team would provide independent technical inputs to the executive director regarding the many responsibilities this individual will be given, as noted in the next paragraph.
3. The executive director should immediately establish a process to transform DoD information infrastructure systems from their present stovepipe configurations into a global DoD-wide common-user virtual intranet, the GIG. This transformation must embody the current and evolving commercial IT standards, protocols, and technology, with the goal of reducing inefficiency in spectrum usage and the costs of information transport, storage, retrieval, and management. Most important, this transition should enable new operational flexibility that can be leveraged by warfighters.

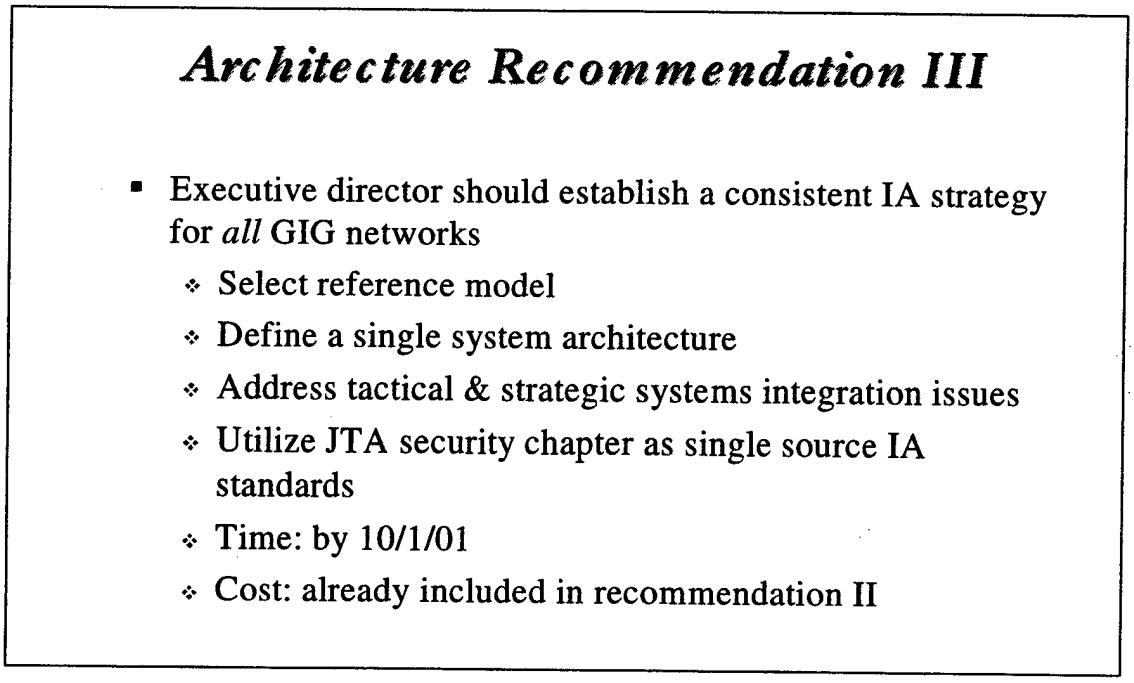

Figure 57. Recommendation III—Architecture

The GIG executive director should immediately set policy and guidance for GIG IAA. Specifically, ambiguities regarding an IA reference model, system architecture, and technical architecture (as noted in the body of the IAA report) should be clarified. The executive director should establish this unified strategy and framework no later than October 2001.

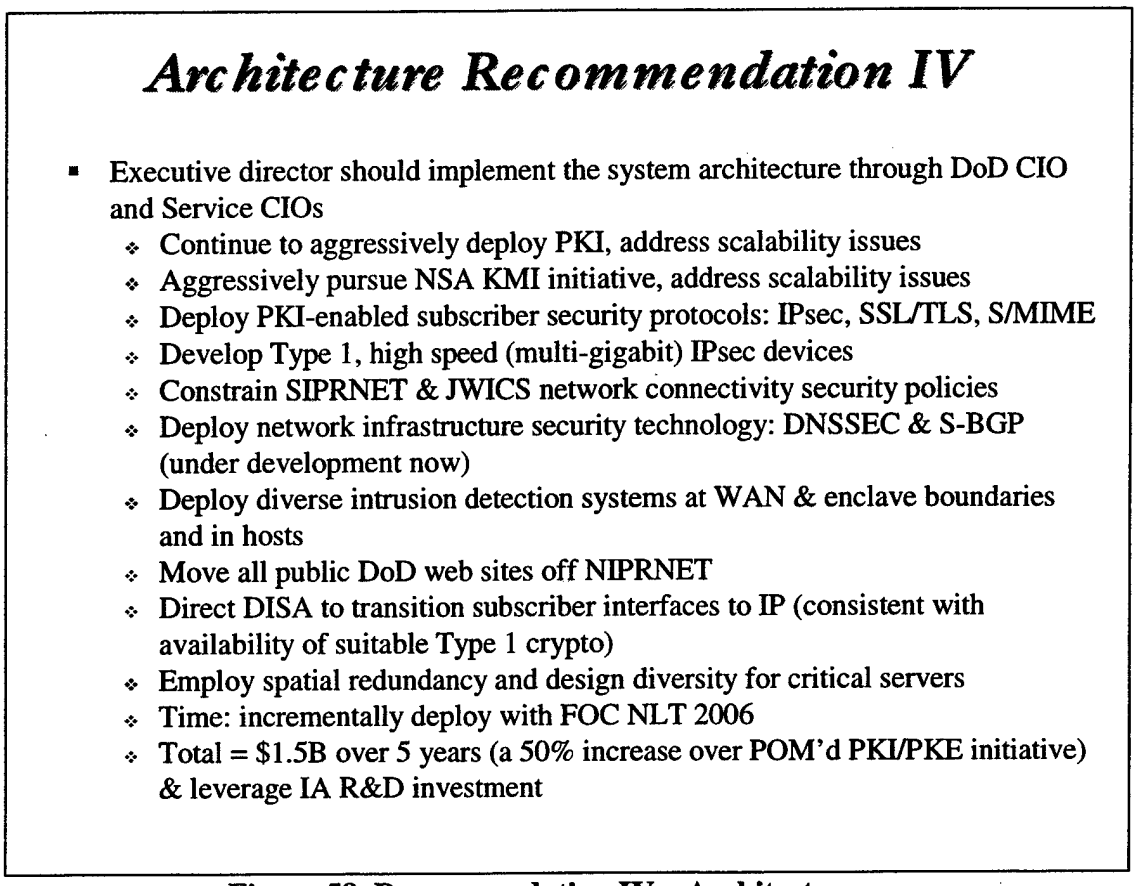

Figure 58. Recommendation IV—Architecture

Finally, the GIG executive director should work through the CIO Executive Panel and the MCEB to implement the GIG system architecture. Specific system architecture and implementation issues that need immediate attention are noted in Figure 58. These include:

- Continuing to aggressively deploy PKI, and addressing scalability issues
- Aggressively pursuing NSA KMI initiative, addressing scalability issues
- Deploying PKI-enabled subscriber security protocols: IPsec, SSL/TLS, S/MIME
- Developing Type 1, high speed (multi-gigabit) IPsec devices
- Constraining SIPRNET and JWICS network connectivity security policies
- Deploying network infrastructure security technology: DNSSEC and S-BGP (under development now)
- Deploying diverse intrusion detection systems at WAN and enclave boundaries and in hosts
- Moving all public DoD web sites of NIPRNET
- Directing DISA to transition subscriber interfaces to IP (consistent with availability of suitable Type 1 crypto)
- Employing spatial redundancy and design diversity for critical servers

To support GIG implementation and to accelerate the DoD PKI/PKE strategy, the panel recommends an increase in budget of 50% over what is presently planned. This increase should not only accelerate the strategy, but also fund the development of Type 1 high-speed IPsec devices. This funding increase should be complemented and supported by the IA S&T investments called for in the companion report of the IA Technology Panel of the Defensive Information Operations summer study.

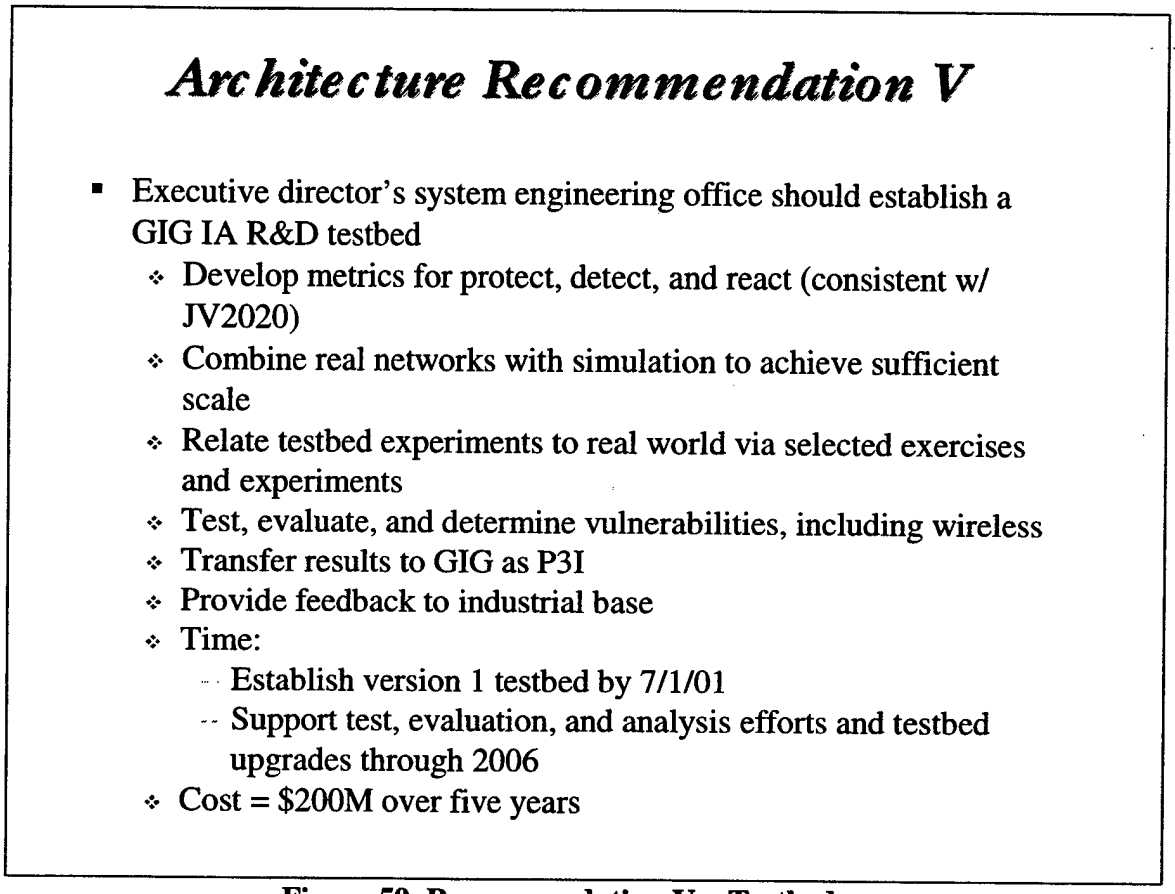

Figure 59. Recommendation V—Testbed

The panel recommends that the executive director's system engineering office establish a GIG IA research and development testbed. The testbed nodes should be located at ESC, CECOM, SPAWAR, AFRL, NSA, etc. The participants in the evaluation process will include research and development, evaluation, and operational communities (services and agencies). The testbed will provide a means for measurement of system performance in the face of red team attacks on blue team scenarios and related information traffic. The testbed will also serve as a primary means for DARPA Information Assurance technology insertion and evaluation. The metrics and measurements will evolve as results are analyzed and lessons learned are derived from the data. Lessons learned will be fed back to red and blue teams to refine and update strategies and will be used by developers to improve system defenses. Lessons learned will also be made available to the GIG architects and system engineers to improve IA for the deployed system.

Finally, the testbed should be used to engineer, evaluate, and update defense-in-depth (DID) strategies and technologies. The testbed will provide the means to understand residual DiD (and GIG) vulnerabilities and thus facilitate cost/benefit analysis for GIG IA investments. As noted in the panel's findings, no rigorous means for evaluating DiD systems, architectures, or technologies exist today.

The testbed should be implemented no later than July 2001, and augmented to support GIG IA technology, architecture, and metric evaluation over a five-year period.

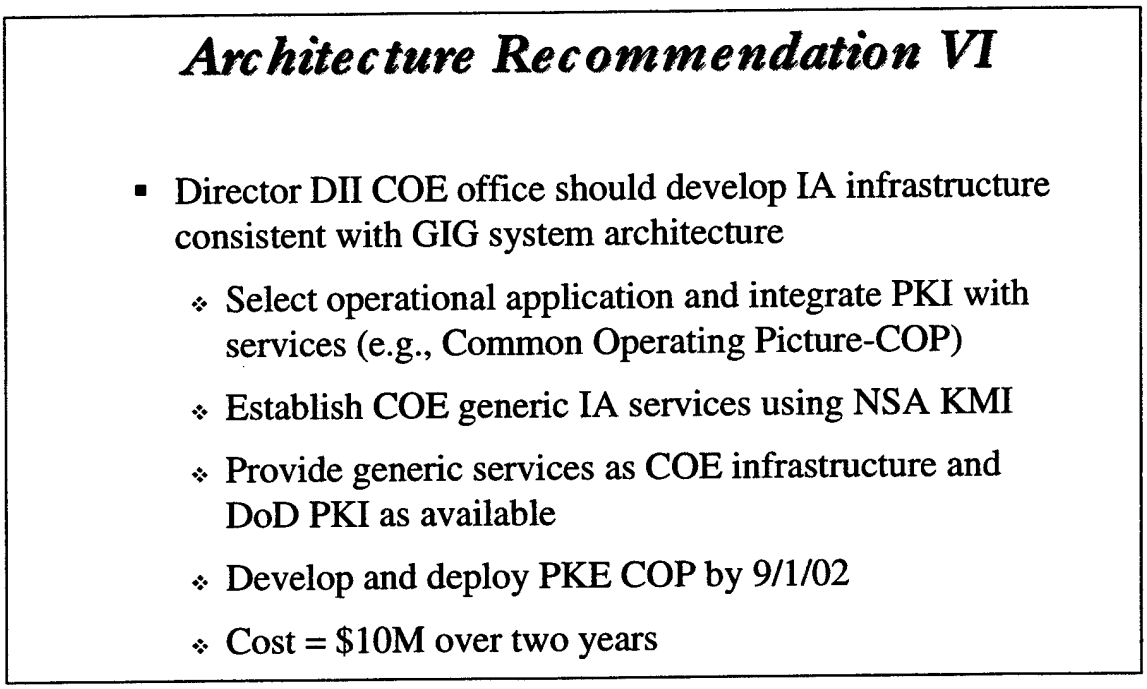

Figure 60. Recommendation VI—IA Infrastructure

The panel recommends that the DoD begin the process of incorporating IA, and specifically PKI/PKE into the DII COE. In discussing alternatives with representatives from DISA, it was noted that the Common Operating Picture (COP) application is critical to CINC and services Joint-Task-Force-mission success. For a modest investment focused on PKE of this application, an acceleration of PKI into the COE, as generic, run-time utilities, can be accomplished. In addition to gaining important experience with PKE in battlefield applications, PKI could be integrated into the COE setting software standards and infrastructure for use in other service and CINC C4ISR systems.

Although IA infrastructure is planned to be incorporated into the COE "sometime in the future," the panel feels that accelerating this process is critical to ensure consistent PKE with tactical C4ISR systems. Experience gained sooner rather than later is key to effectively deploying an IA-enabled COE for the GIG.

ACQUISITION AND TECHNOLOGY

THE UNDER SECRETARY OF DEFENSE

3010 DEFENSE PENTAGON
WASHINGTON, DC 20301-3010

JAN 0 4 2000

MEMORANDUM FOR CHAIRMAN, DEFENSE SCIENCE BOARD

SUBJECT: Terms of Reference -- Defense Science Board Task Force on Information Warfare - Defense

You are requested to form a Defense Science Board (DSB) Task Force to review and evaluate DoD's ability to provide information assurance to carry out Joint Vision 2010 in the face of information warfare attack.

Tasks to be accomplished:

Using the "1996 DSB report on Information Warfare – Defense" as the departure point, address the following:

- What is the status of action on the recommendations?
- Where there are shortfalls, what are the barriers to action and what should be done?
- What important aspects did the 1996 Task Force miss that should have been addressed?
- Assess the recommendations of other important reports that have addressed information assurance issues.

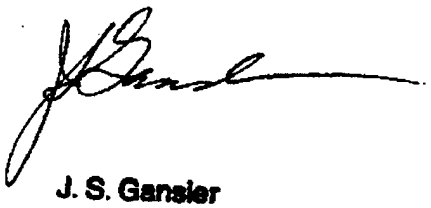
The Information Warfare - Defense Task Force will determine:

- Adequacy of the process toward the information assurance goals needed to carry out Joint Vision 2010.
- Adequacy of the Department's readiness to project and sustain power in the face of information warfare attacks.
- The appropriate role(s) and capability of DoD to provide information assurance in support of Homeland Defense and in support of Critical Infrastructure Protection.
- Recommendations for research and development which are uniquely in DoD's interest, and thus not likely to be accomplished by the private sector in the time required to meet DoD's Information Warfare - Defense objectives.
- Areas in which DoD should seek strong partnering relationships outside DoD, such as with the Critical Infrastructure Assurance Office (CIAO).
- The Task Force should provide an interim report by June 30, 2000.

Page 958 of 3957

The study will be co-sponsored by the Under Secretary of Defense (Acquisition, Technology and Logistics) and Assistant Secretary of Defense for C3I. Mr. Larry Wright will serve as the Task Force Chairman; Colonel Gregory Frick will serve as the Executive Secretary;and Major Tony Yang, USAF, will serve as the Defense Science Board Secretariat Representative.

The Task Force will be operated in accordance with the provisions of P.L. 92-463, the "Federal Advisory Committee Act," and DoD Directive 5104.5, "DoD Federal Advisory Committee Management Program." It is not anticipated that this Task Force will need to go into any "particular matters" within the meaning of Section 208 of Title 18, United States Code, nor will it cause any member to be placed in the position of acting as a procurement official.



J. S. Gansler

APPENDIX B. BIOS

Page 960 of 3957

Page 961 of 3957

DR. MICHAEL S. FRANKEL (Chair) is vice president and director of SRI International's Information, Telecommunications, and Automation Division. Dr. Frankel's expertise is in survivable command, control, and communication system design and implementation, radio frequency systems design and analysis, remote sensing, and data acquisition, reduction and analysis. Dr. Frankel is a Fellow of the IEEE and a member of the Cosmos Club, AFCEA, ADPA, Sigma XI and Tau Beta Pi. He received his B.S., M.S., and Ph.D. degrees in electrical engineering from Stanford University, California in 1968, 1970 and 1973, respectively. He was a member of the Army Science Board from 1992 through 1998, and served as its chair from 1996-98. When he left the Army Science Board, the U.S. Army awarded Dr. Michael Frankel the Distinguished Civilian Service Award. This award is the highest commendation that can be given to a civilian providing volunteer services to the Army and can only be bestowed by the Secretary of the Army. Dr. Frankel is presently a member of the Defense Science Board. He is the author or co-author of seventy SRI technical reports, over twenty publications in technical journals, and two textbook manuscripts. Dr. Frankel holds patent disclosures on passive satellite systems, a passive frequency-steerable microwave repeater system, an emitter location system, as well as one on the TeleEducation concept and a passive, high gain, frequency-steerable satellite repeater.

DR. STEPHEN THOMAS KENT is Chief Scientist- Information Security, BBN Technologies, Director- Security Practice Center, GTE Internetworking, and Chief Technical Officer, CyberTrust Solutions. Dr. Kent holds the following degrees: Ph.D, Computer Science, Massachusetts Institute of Technology, September, 1980; E.E., Electrical Engineering and Computer Science, Massachusetts Institute of Technology, February, 1978; S.M., Electrical Engineering and Computer Science, Massachusetts Institute of Technology, May, 1976; B.S., Mathematics, summa cum laude, Loyola University of New Orleans, 1973.

In his role as Chief Scientist, Dr. Kent oversees information security activities within BBN Technology, and works with government and commercial clients, consulting on system security architecture issues. In this capacity he has acted as system architect in the design and development of several network security systems for the Department of Defense and served as principal investigator on a number of network security R&D projects for almost 20 years. In his capacity as Director of the SPC, Dr. Kent monitors all security-related aspects of the service offerings of GTE Internetworking Services. He reports to the President of GTE Internetworking and coordinates with engineering, operations, and marketing to ensure the security quality of offerings. As CTO for CyberTrust Solutions, Dr. Kent provides strategic direction for this certification authority business, reporting to the President of CyberTrust.

During the last two decades, Dr. Kent's R&D activities have included the design and development of user authentication and access control systems, network layer encryption and access control systems, secure transport layer protocols secure e-mail technology, multi-level secure (X.500) directory systems, public-key certification authority systems, and key recovery systems. His most recent work focuses on public-key certification infrastructures for government and commercial applications, security for Internet routing, and high assurance cryptographic modules.

Page 962 of 3957

Dr. Kent served as a member of the Internet Architecture Board (1983-1994), and chaired the Privacy and Security Research Group of the Internet Research Task Force (1985-1998), both now under the auspices of the Internet Society. He chaired the Privacy Enhanced Mail (PEM) working group of the Internet Engineering Task Force (IETF) from 1990-1995 and co-chairs the Public Key Infrastructure Working Group (1995-). He was a charter member of the Board of the International Association of Cryptologic Research (1982-89) and served on the editorial board for the Journal of Telecommunication Networks (1982-1984). He currently serves on the editorial board of the of Journal Computer Security (1995 and on the board of the Security Research Alliance, a consortium of leading information security companies.

Dr. Kent served on the Information Systems Trustworthiness Committee (1996-98) of the Computer Science and Telecommunications Board (CSTB) of the National Research Council (NRC). He was major contributor to the committee report, "Trust in Cyberspace." Previous CSTB/NRC service includes the committee on Rights and Responsibilities of Participants in Networked Communities (1993-94), the Technical Assessment Panel for the NIST Computer Systems Laboratory (1990-1992), and the Secure Systems Study Committee, which produced the "Computers at Risk: Safe Computing in the Information Age" report (1988-1990). Dr. Kent has often been called upon as a reviewer of CSTB committee reports.

The Secretary of Commerce appointed Dr. Kent as chair of the Federal Advisory Committee to Develop a FIPS for Federal Key Management Infrastructure (1996-98). The output of that committee forms the underpinning for a FIPS on Key Recovery. He previously served on the Presidential SKIPJACK Review Panel (1993-1994).

Dr. Kent has been an active participant in a number of professional conferences, as a speaker, session chair, program committee member, etc. He chaired the steering committee for the Symposium on Network and Distributed System Security (1990-1998) and was General Chair of the IEEE Symposium on Security and Privacy (1996-97). He has appeared as an invited speaker at security conferences throughout the United States, Europe and Asia.

Since 1977, Dr. Kent has lectured in the United States, Europe, Australia, and Asia on the topic of security in computer communication networks on behalf of various organizations, including the National Cryptologic School, George Washington University, M.I.T., University of Southern California, UCLA, various government agencies, and several private firms.

DR. PATRICK LINCOLN is the Director of the Computer Science Laboratory of SRI International, a leading center for research on the fundamental issues of computer security, networks, and automated formal methods. Under his direction, the lab is expanding its presence in these areas and is extending its research agenda into new areas. Dr. Lincoln joined SRI in 1992 after completing Ph.D. work at Stanford University in Computer Science. He holds a B.Sc. from MIT and has previously held positions at MCC and Los Alamos National Laboratory. Dr. Lincoln is an active researcher in the fields of networks, security, language design, and mobile code. He has published widely and made significant contributions to the formal analysis of systems, languages, and protocols in computer security, safety, and fault tolerance, and to their integration into survivable systems. He serves on the Digital Island (Nasdaq:ISLD) Strategic Advisory Board. http://www.csl.sri.com/~lincoln

Page 963 of 3957

ALAN J. MCLAUGHLIN received BS and MS degrees in Electrical Engineering from Northeastern University in 1957 and 1959, respectively. During 1959-60 he served as a Lieutenant in the U.S. Army Signal Corps Laboratories at Fort Monmouth, NJ. He was awarded the Army Commendation Medal for meritorious service. From 1961-71 he was a Lecturer at the Northeastern University Graduate School of Engineering.

From 1960 to 1962 he was a project engineer with Contronics, Inc., engaged in the design and development of automatic test equipment. He joined the engineering staff of Deco Electronics, Inc. in 1962, where he designed digital communications equipment. In 1965 he became a systems engineer with General Instrument Co., where he was involved with the design of sonar systems and associated signal processing equipment.

In 1967 Mr. McLaughlin joined the staff of MIT Lincoln Laboratory. Initially he was engaged in the design of special-purpose processors for anti-jam communications systems and later with the design of high-speed signal processors. He established a laboratory for the investigation of GaAs laser diode parameters and participated in the design of an optical communications system. In 1972 he joined the Education Technology Group where he was responsible for the design of Computer-Aided Training systems. In 1974 he was appointed Leader of the Education and Computer Technology Group.

In 1975 he was appointed Associate Head of the Computer Technology Division and a member of the Lincoln Laboratory Steering Committee. In 1978 he was appointed Head of the Computer Technology Division with management responsibility for laboratory programs in speech, radar and image signal processing, computer networks, digital processor technology, digital integrated circuits and machine intelligence technology. In 1992 he was appointed Assistant Director of Lincoln Laboratory. He is currently responsible for Advanced Electronic Technology, Air Traffic Control and Surface Surveillance programs at the Laboratory.

In 1978-79 Mr. McLaughlin served on an Air Force steering committee for advanced computer technology planning. In 1980-81 he served on a National Academy of Science study committee on modernization of Air Force computerized administrative support systems. In 1984-85 he was a member of a senior advisory committee to the Director of ARPA in the area of information processing. Since 1986 he has been a member of the ARPA Information Science and Technology Study Group. In 1988-89 he served as co-chairman and in 1990-91 chairman, of the ARPA Study Group. In 1991-92 he served on a National Academy of Science study committee on Modernization of the Worldwide Military Command and Control Information System. In 1993 he served on the Air Force Scientific Advisory Board Study on Information Architectures. In 1994-95 he served on a National Research Council Committee on Future Technologies for Army Multimedia Communications. He has served on a variety of Defense Science Board task forces: 1994-95 Acquiring Software Commercially, 1996 Defensive Information Warfare, 1996-97 Aviation Safety, 1997-98 Military Excess and Surplus Material, 1999 Investment Strategy for DARPA. Mr. McLaughlin is a member of Eta Kappa Nu and a Senior Member of the IEEE.

Page 964 of 3957

PETER STEENSMA is Chief Scientist and Senior Technical Director, ITT Aerospace Communications Division. He received his B.S. degree at Calvin College in Physics, Mathematics, and German Literature; his M.S. was received from the Polytechnic University of Brooklyn; and he was a Research Associate at Princeton University.

Mr. Steensma has 30 years of communications systems design and development experience, including mobile tactical networks, tactical switching, radio and optical fiber transmission, secure command and control networks, and satellite and terrestrial radio navigation.

Recent highlights include:

- Initiated and provided technical leadership to several programs aimed at establishing the next generation of mobile tactical communications systems, including Hand-held Multimedia Terminal and Small Unit Operations DARPA programs
- Formed international consortium of 12 nations and established a multinational joint venture company, TACONE, to set next generation NATO post 2000 communications standards
- Led conceptualization and development ITT communications products in the Tactical Internet, including SINCGARS radios (SIP and ASIP), Near Term digital Radio (NTDR), and the Internet Controller. These supported the US Army TF XXI exercises and subsequent digitization efforts
- Technically led a winning US/UK team for UK Project Bowman, a total Forward Area Battlefield Communications System for the United Kingdom Ministry of Defense. Led the development and demonstration of a Product Demonstrator, the first mobile tactical internet system. Continuing responsibility and support for developing production solution

Past positions include, Director of Systems Engineering, Director of Internal Research and Development, Manager of C2 Systems Engineering, Senior Scientist Transmission Systems.

JOHN WOODWARD is the Technical Director of the Intelligence and Special Programs Division, which executes MITRE's $35M Air Force intelligence program. Mr. Woodward also serves as corporate Director of Information Warfare, where he is responsible for ensuring that MITRE's varied information warfare activities are coordinated, responsive to broad government objectives, and of high quality.

Mr. Woodward has more than 25 years of experience in software engineering with MITRE, and has specialized in information system security for the past 22 years. Prior to his present position, he was the Associate Technical Director of the Information Systems Security Division, where he shared management responsibility for MITRE's technical center providing information security and defensive information warfare expertise throughout MITRE, and to MITRE's Department of Defense, intelligence, and Federal Aviation Administration customers.

In earlier positions at MITRE, he managed the prototype development of the Joint Worldwide Intelligence Communications System, and was responsible for MITRE's intelligence information system support to the Defense Intelligence Agency, North American Air Defense/U.S. Space

Page 965 of 3957

Command/Air Force Space Command, and the Strategic Air Command. He also led MITRE's Artificial Intelligence Technical Center. He was responsible for inventing, prototyping, and specifying compartmented mode workstations, which are now available commercially from multiple vendors. He also created and was the original chairman of MITRE's Information Policy Committee.

Mr. Woodward received masters and bachelor's degrees in applied mathematics/computer science in 1974 from Brown University.

DSB IAA PANEL
Agenda 20 April 2000

Thursday, April 20, 2000

0800 – 0830	Opening Remarks	Dr. Mike Frankel *Panel Chairman*
0830 – 0930	Navy/Marine Corps Intranet	Mr. Scott Henderson *SPAWAR*
0930 – 1030	DII Security Architecture	Mr. Richard Hale *DISA*
1030 – 1100	Break	
1100 – 1130	ISO Security Reference Model	Dr. Stephen Kent *BBN Technologies*
11:30-12:00	Lincoln Lab Security Metrics	Mr. Alan McLaughlin *MIT/LL*
12:00 – 12:30	Lunch/Discussions	
12:30 – 1:15	Gold Security Architecture Reference Model	Mr. Terry Mayfield *IDA*
1:15 – 2:00	IA Operation Readiness Metrics	LtCol Lisa Lemza J-6
2:00 – 2:15	Break	
2:15 – 5:00	Discussion and Wrap-up	

Page 973 of 3957

Agenda

Defense Science Board Spring Quarterly Meeting

May 24-25, 2000

Thursday, May 25, 2000 (3E869)

0800	Defensive Information Operations Study	Mr. Larry Wright
0830	Network Security & Architecture	Dr. Michael Frankel
0900	Defensive Information Operations Legalities	Mr. Stewart A. Baker
0930	Defensive Information Operations Organization	MGEN John P. Casciano, USAF (Ret.)
1000	General Henry Shelton, USA, CJCS	
1030	Break	
1045	Defensive Information Operations Policy	Mr. Richard Wilhelm
1115	Defensive Information Operations Technology	Mr. Richard M. Mendelowitz
1200	Lunch in Blue Room (3D854) hosted by Hon. Jacques S. Gansler, Under Secretary of Defense (Acquisition, Technology & Logistics)	
1315	Annual Group Photo (River Entrance)	
1330	Intelligence Needs for Civil Support	Dr. Ruth David Mr. Peter Marino
1430	Hon. Jacques S. Gansler	
1530	Closing Comments	DSB Chairman
1545	Adjourn	

Page 974 of 3957

DRAFT AGENDA

MAY 26, 2000
DSB TASK FORCE ON DIO
STRATEGIC ANALYSIS, INC.
3601 WILSON BLVD. SUITE 600
ARLINGTON, VA 22201

Time	Topic	Briefer
0800	Pervious DARPA IA perspective	Sami Saydjari
0900	DARPA IA (follow-on)	Mike Skroch
1000	USSPACE	Col Larry Klooster
1100	CISCO perspectives	J. Romain
1200	Lunch	
1300	Biometrics	Jeff Dunn, NSA
1400	NSA Senior IA perspectives	John Nagengast
1700	Adjourn	

DRAFT AGENDA
DSB TASK FORCE ON DIOAT
SAIC SCIF
4001 N. Fairfax Drive, Suite 500
Arlington, VA
Tuesday, June 13, 2000

TIME	TOPIC	BRIEFER
0800-0930	Performance Needs/Developing technology	Lee Hammarstrom & Pat Dowd
0930-1030	Chessmaster and recent events	Mike Shore
1030-1200	History of IW	ADM Bill Studeman, USN (Ret)
1200-1:00	Lunch	
1:00-2:00	CIA Strategic Warning/ Threat	Dr. Tom Donahue
2:00 – 3:00	Discussion	
3:00 – 4:30	IA Metrics	Mr. Terry Bartlett/DIAP
4:30 – 5:00	Wrap-up	

DSB IAA PANEL
Agenda
June 14, 2000
To be held at the offices of
Strategic Analysis, Inc.
3601 Wilson Blvd., Suite 600
Wednesday, June 14, 2000

7:30 – 8:00	Coffee – Sign-in	
8:00 – 9:00	TA Security Standards	Mr. James Barnette DISA
9:00 – 9:30	Results of a DARPA sponsored study on "Information Assurance for Mobile Operations" An approach and some preliminary results on: "Intrusion Detection for the Lower Tactical Internet"	Mr. Al Mclaughlin/MIT/LL
9:30 – 9:45	Break	
9:45 – 12:00	Architecture Development and Recommendations	
12:00 – 12:30	Working Lunch	
12:30 – 3:30	Architecture Development and Recommendations

DSB IAA PANEL
Agenda
July 12-14, 2000
To be held at the offices of
Strategic Analysis, Inc.
3601 Wilson Blvd., Suite 600

Wednesday, July 12, 2000

TIME	TOPIC	BRIEFER
8:00 – 8:30	Coffee - Sign-in	
8:30 – 10:30	IAA Introduction	Dr. Mike Frankel
10:30 – 10:45	Break	
10:45 – 11:45	IA Wireless Issues	Mr. Pete Steensma
11:45 – 12:30	Lunch	
12:30 – 1:30	Reference Model	Dr. Stephen Kent Dr. Patrick Lincoln Mr. John Woodward
1:30 – 2:30	IA Metrics/Standards	Mr. Al McLaughlin
2:30 – 3:30	Technical Architecture	Dr. Stephen Kent Dr. Patrick Lincoln Mr. John Woodward
3:30 – 4:30	System Architecture	Dr. Stephen Kent Dr. Patrick Lincoln Mr. John Woodward

Page 977 of 3957

Thursday, July 13, 2000

8:00 – 8:30	Coffee – Sign-in	
8:30 – 10:00	COE	Mr. Ken Wheeler DISA
10:00 – 11:30	JWICS	Mr. Jim Watson DIA
11:30 – 12:30	General Issues Discussion	All
12:30 – 1:00	Lunch	
1:00 – 5:00	Integrate Briefings	All

Friday, July 14, 2000

8:00 – 8:30	Coffee – Sign-in	
8:30 – 9:00	Front End of Outbrief	Larry Wright
9:00 – 9:15	Findings & recommendations – Legal Panel	Stewart Baker
9:15 – 9:30	Findings & recommendations – Policy Panel	Rich Wilhelm
9:30 – 9:45	Findings & recommendations – Organization Panel	John Grimes
9:45 – 10:00	Findings & recommendations – Technology Panel	Rich Mendelowitz
10:00 – 10:15	Findings & recommendations – IAA Panel	Mike Frankel
10:15 – 15:00	Task Force Discussion on outbrief and other issues	All

EXECUTIVE SUMMARY

Within the Department of Defense, the next several years will be marked by steadily increasing reliance on automated information systems. In accord with Joint Vision 2020 (JV2020), the Department will be proactive in supporting and shaping this evolution.

In recognition of this reliance on information systems and in reaction to attacks on DoD computer systems, the Department has begun a wide range of activities that focus on prevention of problems through protection of computer networks. The rapid advances in information and communications technology mean that as the years pass, entirely new infrastructures, embodying new technologies, will emerge – and each will be accompanied by its own set of new vulnerabilities. As a result, protection of networks will necessarily require continuous improvement. These protections will require vigorous and focused research. It is the view of this Technology Panel that an increase in research beyond current levels is required to minimize the vulnerability gap that will always exist between network vulnerabilities and network protection. It should be noted that DoD requirements for protection are likely to go well beyond what is required by the private sector.

As computer networks and weapon systems lose their individual identity and merge into one, protection will be necessary, but not sufficient to assure that networked information will be available when required. As this Defense Science Board has noted, despite the best network protection, attacks will occur and some will succeed. When a computer network has been attacked, the commander must be able to know:

- When will the system be restored?
- How much of the system will be restored?
- How much of the original system will operate?
- What are the consequences of limited network availability?
- Will the information on the network be reliable?
- How will the commander know for sure that the information is reliable?
- What options will be available to the commander?

Today, the answer to these questions would be, "We do not know." This is clearly a bad answer in peacetime and a totally unacceptable answer during a military operation.

The Department has reached a milestone with its awareness of computer network vulnerabilities, and with funded programs to address protection and defense of networks. Unfortunately, while restoration of network service, data integrity, and confidence in the data on the network are as important to success of JV2020 as network protection, these activities remain largely ignored and are essentially unfunded. Successful development and implementation of these "consequence management" functions are the next major milestone for DoD Information Assurance (IA).

Page 993 of 3957

The Department must also aggressively address its information assurance (IA) research and development (R&D) personnel requirements now, in order to avoid more serious problems in the next few years as more personnel leave the Department and fewer high-caliber R&D managers remain. Although this topic is addressed more extensively by another Panel report, we believe it is so fundamental that we endorse and highlight the finding. Education and training issues must be among the very first steps that the Department should take in this area. As urgent as the other IA technology issues are that we discuss below, this issue is the highest priority in the technology area. Without enough qualified and well-trained technical people, virtually all of the issues that the Department faces in IA will be even more difficult to resolve.

Protection of DoD networks is fundamental to the success of future operations, and this protection depends upon a very focused R&D program. However, this Panel finds that IA R&D activities are distributed among the Defense Advanced Research Projects Agency (DARPA), the services, and defense agencies. Some long-term research is ignored, and some short-term research is redundant. Accordingly, this Panel proposes a new and very focused management of IA R&D. Establishing an information assurance R&D office in the Office of the Secretary of Defense (OSD) that reports to the Global Information Grid (GIG) architect is the first step in bringing focus to IA R&D management. This R&D office will assure that DoD research for IA be coordinated, be subject to multi-year planning, take into account private-sector research, and be adequately resourced to minimize DoD network vulnerabilities on a rapid but achievable timetable. Given today's commercial product cycles, it is unlikely that any new DoD-sponsored research will produce protection results that can be transferred within three years into critical networks. DoD research must therefore be a long-term, continuous investment activity that should not be expected to play a significant role in the near term.

Moving resources from minimally funded protection activities to network restoration activities will not result in an acceptable solution for either problem. Establishing a new milestone of consequence management calls for additional funding. Since the commercial world has largely ignored this issue, solutions will have to start with a vigorous DoD R&D program. This Panel believes that the minimum R&D investment that should be added to current efforts to improve the overall security of the GIG is $350 million over five years– about twice the level of funding today.

Page 994 of 3957

INTRODUCTION

The 1996 Defense Science Board (DSB) Summer Study brought attention to the increasing reliance of DoD on networked computer systems. The DSB report noted the vulnerability of these computer systems, and the fragility of the information residing on and passing across these networks. It made strong recommendations that the Department increase emphasis on the protection of these systems and the information they held. The report also recommended that computer network defense (CND) become integral to the development and deployment of DoD networks.

During the four years since that report, the Department has made considerable progress on these recommendations. Awareness of computer network vulnerabilities is much higher, and various system components have been deployed specifically for network security. Research programs, principally at DARPA and the National Security Agency (NSA), have emphasized those defensive technologies that DoD requires but commercial systems are unlikely to include.

However, during that same period of time:

- DoD has greatly increased its reliance on information contained in, processed by, and distributed over networked computer systems.
- Information superiority has become essential to achieving JV2020. This vision requires highly secure networked systems.
- Intrusions into DoD networked computer systems have become more sophisticated and more frequent. (The frequency of these intrusions is similar to what is being experienced in the non-DoD environment.)
- Development and deployment of new network technology has greatly outpaced information assurance technology, increasing the vulnerability of DoD systems.

As a result, despite the considerable progress that is apparent within DoD, a computer network vulnerability gap has continued to increase. Systems complexity is growing faster than solutions. And while new network capabilities will most certainly always outpace defensive technologies, considerable DoD R&D must be devoted to computer network defense to manage and reduce the vulnerability of this critical capability.

Potential adversaries have recognized both the increasing reliance of DoD on networked computer systems and the opportunity they now have to diminish the effectiveness of DoD operations through active network attacks. For example, representatives of both China and Russia have expressed the belief that they can neutralize U.S. capabilities through information operations. The "Unrestricted War" concept from China and the Russian nationalist Vladimer's comment that "we can bring the entire West to its knees with our computer specialists" are examples of that thinking.

In order to assure the availability and integrity of critical DoD computer networks, the Department must develop a long-term strategy that posits a desired end-state for information assurance that is consistent with JV2020 and provides a roadmap for achieving that end-state. While many areas need to be included in an overall roadmap, the information assurance R&D

Page 995 of 3957

roadmap is fundamental. The key for DoD to be prepared on the scale required is an information assurance R&D program supporting the protection needs of the global information grid.

The information volume that JV2020 will need to handle and protect will be vast. It is already possible to project data rates that will require protection in the range of multiple terabits per second. These rates are comparable to moving the current Library of Congress electronically every minute. The DoD and intelligence databases in 2020 almost certainly will be many hundreds of times those of the current Library of Congress. While secure remote access to data will reduce somewhat the requirement for data rates and bandwidth that increase in proportion to the size of databases, it is still obvious that protecting information in the volumes required for successful execution of JV2020 will be a daunting task.

It has recently been understood that no matter how sophisticated defense of computer networks becomes, they will remain vulnerable to a determined adversary, disgruntled employee, or simply natural events. Experience shows that as our defensive capabilities increase, so will the adversary's offensive ones. U.S. adversaries over the next 20 years will be developing a range of attack capabilities that will likely cover every possible node and path of DoD networks.

There will certainly be attacks against DoD networks. Many will be ineffective, but more importantly *some attacks will succeed.* The results of a successful attack will range from an irritation or embarrassment all the way to serious disruption of critical DoD networks or information. The severity will depend on the attacker's skill level and resources, and the defenses DoD has in place. These attacks could result in serious damage to a critical DoD network, but could also compromise a warfighter's confidence in the information system he or she has to rely on – no matter what the attack actually accomplished.

Unfortunately, today DoD has no methodology for dealing with the consequences of a successful attack and restoring integrity in its systems. And so, with the ever-increasing reliance of DoD on computer networks as an integral component of war fighting, **this Defense Science Board finds that it is now necessary to develop technologies to help recover and restore its networks and the data they contain**. One of the key tasks in this area will be to restore the integrity of networked computer systems that have been attacked, or are thought to have been attacked, and restore confidence that they remain ready for their intended purpose. Warfighters must have confidence in their information and the technology that provides it. The technologies that will deliver effective defense in depth of DoD, be able to recover and reconstitute those networks after an attack, and restore their integrity, need considerable emphasis.

It should be noted that any list of research areas compiled today would certainly not be a complete list for tomorrow. Part of the information assurance R&D management challenge in the rapidly evolving world of information technology, is the frequent examination of those research areas most needed to provide defense of and integrity restoration to the latest computer network developments and deployments. Against the tide of technological advances and determined adversaries, considerable R&D will be required just to maintain the level of security we have today. Much of the R&D required by the DoD will not come from the private sector. To achieve and maintain the higher levels of protection required by JV2020, it will be necessary for DoD R&D investment to keep pace.

The DoD must provide the support for an aggressive R&D program that has the breadth and depth to deal with the entire spectrum of information assurance issues. These issues range from near-term needs to thwart the latest threats that surface, to long-term basic research. The latter

Page 996 of 3957

must be coupled with an examination of the R&D strategies necessary to satisfy the full range of JV2020 requirements. Further, the R&D program must result in products that are unique to DoD requirements and which complement and enhance commercial systems. Many of these research programs will necessarily be long term—not suited to short-term evaluations.

The specific amount of R&D funding required is likely to be a matter of debate, but the general level needed is at least a factor of two over the DoD information assurance R&D spending of today. There are many areas that are today minimally funded, which this report highlights. There are certainly many more areas that time did not allow us to pursue, or that have simply not yet been articulated.

Page 998 of 3957

RESEARCH TOPICS

The pace of technology growth guarantees that any list of needed research topics will be incomplete shortly after it is written. Part of the information assurance R&D management challenge in the rapidly evolving world of information technology is the frequent examination and re-evaluation of those research areas most needed to provide defense of and integrity restoration to the latest computer network developments and deployments.

Keeping in mind the need for frequent re-evaluation of R&D programs in light of commercial developments, research successes, and new deployments, there are four general topic areas that prove useful in categorizing R&D for computer network defense. This report provides findings on areas of necessary research in each category of a network attack timeline, namely:

1. Early Capability Assessment
2. Prevention and Protection
3. Consequence Management
4. Attribution

What follows is a general description of each of these topics together with some representative technologies that this Panel feels currently need increased attention.

EARLY CAPABILITY ASSESSMENT

Computer network defense, like any defense, is most effective if the intentions and capabilities of an identified adversary are understood, and when it is known that offensive operations have, in fact, begun. The technology for this entire area of intelligence, indications and warning, intention, and identity-determination is complicated by legal and policy issues, which are discussed elsewhere in this report. Examples exist today of attacks which have gone unnoticed, of intrusions with unknown purpose, and of network disruptions that have remained un-diagnosed. This is a technology area that must mature as JV2020 develops. Some necessary research topics include the following.

Cyber Intelligence Tools

One of the weakest aspects of U.S. defensive information operations is our extremely limited ability to detect, assess, and understand both hostile information operations (IO) capabilities and precursor indications and warning of attack. A program is required to develop tools to attenuate these shortcomings. Advanced active agents using secure mobile code would be developed that could gather information without taking any hostile actions. "Picket" or "sentinel" agents could provide early warning of hostile action or intent. This program will ideally result in an array of tools that will provide a much greater understanding of hostile IO capabilities against the United States and its allies and better warning of incipient attacks.

Attack Pattern Discovery

No methods exist for automated or assisted discovery of existing or novel attack patterns or signatures, particularly for those attacks that are distributed across many computers or networks.

PREVENTION AND PROTECTION

Much of the progress within DoD since the 1996 DSB report has been in the area of protection of DoD networks and prevention of unauthorized access. These are very important and sensible places to begin the defense process. However, as DoD becomes more and more dependent on networks, and as the complexity of these networks increases, the opportunities for disruption will also increase. R&D is required that is specifically designed to prevent problems caused by both insiders and outsiders, to prevent unknown attacks, and to guard against commercial systems with unknown flaws. The science of network security is currently immature, but with proper R&D infusion, the foundation for the protection required by JV2020 can be put in place.

Representative areas of research to enhance protection of DoD networks and prevention of unauthorized access would include those that follow.

Scalable Global Access Control

Current DoD network architecture calls for a secure network with authorized access via tokens – a public key infrastructure (PKI). The scope of this security apparatus is enormous. It will involve distribution of secure capability to multiple locations in many countries. It will require limited access for foreign coalition partners. It will necessitate the distribution of millions of tokens – some number of which must be issued and revoked on a daily basis. It will require rapid implementation and expansion during a period of crisis. It cannot burden the user. It must withstand insider attacks.

These are severe requirements. PKI has not been modeled and tested under extremes of this type. It is the security backbone of the future, and must be supported by a vigorous R&D program that addresses its scalability, its extremes, and any vulnerability. It requires the same attention to detail that continuous testing of high-grade cryptographic systems has had over the past several decades.

Malicious Code Detection and Mitigation

The need to nullify malicious code is acute for both the defense information infrastructure and the national information infrastructure because of increased connectivity and reliance on the Internet, increasing prevalence of mobile code, and likely development of and access to code by disgruntled insiders and outsiders.

Malicious code is defined as a program that is written or introduced into a system by someone with malicious intent. The program is intended to damage system function without the operator's knowledge or consent. It is the most rapidly emerging and least understood cyber threat to DoD information systems. Examples of such code are Trojan horses, viruses, worms, trap doors, and time bombs, and each has had notorious successes in worldwide attacks against commercial and military networks and systems. Ominously, the latest versions of these codes represent a merging of the characteristics and capabilities of these existing threats into new, more

Page 1000 of 3957

powerful forms. Code mobility provided by the World Wide Web has further facilitated the spread of malicious code.

Presently, malicious code is being countered by firewalls, virus-checking software, and similar defensive mechanisms. These mechanisms rely on knowledge of past attack modes. The response to new attacks is reactive, i.e., the response occurs after the attack has been initiated, significant damage to data has been done, and systems have been shut down to cleanse them. Well-designed attacks are succeeding, with such denial-of-service events as Trinoo scripts and "I love you" viruses not only damaging services, but also eroding confidence in the security of both commercial information and the systems required for national defense.

Future research needs to enable malicious code defenses to become more proactive. It must enable real-time detection and neutralization of attacking codes, the development of tolerant system architectures, and the creation of security policies and policy enforcement mechanisms. Though security policy may seem a vague abstraction, it is crucially important in controlling malicious code. Without a security policy that defines what actions are prohibited, it is difficult to argue that any code is malicious and even harder to define policy enforcement mechanisms.

Mitigating and eliminating malicious code in its many forms is crucial for protecting the information infrastructures that are an integral part of our society and the backbone of JV2020. Research for the following areas will require a multi-disciplinary approach that brings together experts from computer science, information security, and real-time systems design. Overarching research needs to be undertaken in the following areas: (1) defining a malicious code taxonomy to facilitate research discussion, (2) providing a mapping between this taxonomy and the kinds of mechanisms that would be needed to protect and detect malicious code, and (3) designing new software architectures and tolerance measures that would facilitate elimination of malicious code. In addition, specific research is required for addressing malicious code, including: (1) semi-automatic source code inspection for existing attacks (static), (2) dynamic code scanning, (3) system integrity checking, (4) reverse engineering, and (5) code signing. This research will broaden coverage of the information assurance spectrum, advance an emerging information assurance industry, and contribute to a deeper understanding of defensive information operations.

Mobile Code Security

Mobile code security decomposes into three challenges:

- Protect hosts from malicious inbound code
- Protect code from malicious hosts
- Construct survivable distributed systems capable of tolerating compromised elements

Although the question of protecting hosts from malicious code is far from resolved, this challenge represents a special case of the general malicious code. The distributed nature of malicious mobile code opens opportunities not available to isolated systems.

Protecting individual parts of mobile code from malicious hosts represents a more difficult problem given natural dependencies on the executing platform. Although general solutions seem distant and speculative at this point, the potential at least bears further exploration.

Page 1001 of 3957

Conversely, it may be possible to leverage code mobility in constructing survivable distributed systems more capable of tolerating compromised elements. This potential stems from the ability to dynamically distribute an application across many hosts. Such dynamic fragmentation could eliminate a priori information necessary for adversarial strategic targeting. Moreover, if future network bandwidth and computing power facilitate shipping both internal memory structures (e.g., stack) and code snippets around the network, architectures could be constructed with far less exposure at any given time. The challenge of leveraging code mobility to increase survivability seems quite promising as a general area of research.

Anomalous Behavior Detection

The technologies for detecting anomalous behavior are too brittle to produce robust and useable results. Outcomes are laden with false alarms and missed events, both of which increase human and system workload, while reducing confidence in results. These technologies are badly needed for mitigation of the insider threat, as well as for underpinning downstream technologies for detection of related threats.

Fault Tolerance

There is a paradigm-shift taking place in the technical approach to information assurance and defensive information operations. The decades-old approach of resisting attacks and trying to keep all intruders out does not work in the new Internet age. Prevention and avoidance techniques must be augmented with fundamentally secure architectures that can tolerate mobile and malicious code, active content, distributed denial-of-service attacks, and insider threats. We must strive to make systems inherently more tolerant and resilient to attacks, malicious faults, and insider misuse and abuse.

Fault-tolerance technologies have been successfully used to construct highly available and reliable systems for transportation and financial sectors as well as real-time control of plants, vehicles, and command and control systems. Such fault-tolerant systems have been designed to cope with naturally occurring faults and failures such as hardware component faults, design errors in software, and environmentally induced faults such as transients caused by lightning. Advanced research is needed to adapt these technologies for intentional faults and attacks mounted by a human adversary. Research is also needed in creating fundamentally new intrusion- and attack-tolerant systems that use and exploit design diversity, stealth, randomness, and uncertainty as built-in system attributes.

Page 1002 of 3957

Investment in the following specific technologies is important to achieve the goals of survivable, fault-tolerant systems:

Proof Carrying Code
Secure Mobile Code Languages
System Health Monitors/Tolerance Triggers
Stealthy System Structures
Dynamically Reconfigurable System Architectures
Data Recovery Schemes
Composability of Trust
Design and Implementation Diversity
Uncertainty, Randomness, Agility, and Deception
Code Execution Real-Time Monitors
Fragmentation, Redundancy, and Scattering
Security Policy Specification

High-Speed Encryption

Over-the-network access, both to classified and unclassified-but-sensitive information, is of critical importance, as the Global Information Grid becomes reality. The near-instantaneous global access available once one is "inside" the protected network raises the issue of how to recover quickly from problems such as the loss of an encryption device. There is also the necessity to rapidly add or remove coalition partners from a network during international operations.

For the DoD to conduct operations using the GIG, it must have the ability to almost instantaneously remove selected (compromised) users from the grid, while at the same time permitting the remaining users to continue to conduct their operations. Important pieces of this complex problem are being solved. The STU-III model was a start, but the supporting infrastructure does not scale to required levels. There are upgrades underway, but they are not of the scope necessary to address JV2020 requirements.

At least three major technical challenges exist. First is the development of a high-speed encryption device that can scale to the 10 Gbps rate and beyond. A second challenge is to build an encryption device that is protocol-, algorithm-, and key-agile. This class of device is required if the GIG is to be interoperable with legacy devices and with coalition partners. The third challenge is to reduce the cost of the security functions and to integrate them into embedded capabilities that are transparent to the users. The more transparent the security functions are, the more they will be used and not bypassed in time of crisis. The DoD needs to work with vendors in the earliest stages of developments to integrate highly scaleable security into their products.

Advanced Intrusion Detection/Monitoring

Intrusion-detection technologies currently produce only moderately reliable results in simple environments, and even less-reliable results in complex environments. In terms of correlating and fusing information from distributed sensors in distributed attacks, what little technology exists is too immature to be useful. Intrusion-detection technologies are critically dependent on

Page 1003 of 3957

monitored sensory data. However, with respect to what is monitored and the places from which the monitoring data are taken, little to nothing is known about either how to decide what should be measured, or how to determine the most effective placement of sensors in an operational environment.

CONSEQUENCE MANAGEMENT

Some network attacks will be successful, and DoD does not have adequate technology in place to address the consequences of the successful attacks. Even as we improve our ability to protect networks and systems from attacks, some attacks will be successful. When a successful attack occurs, we must have tools, techniques, and procedures in place to limit the consequences. The need to continue operations, even at a reduced level, is critical in military operations. Research is needed to improve our ability to address the impacts of successful attacks. Some of the areas that should be included in a research program are self-healing networks and systems, network isolation, integrity restoration, and recovery and reconstruction.

DoD needs to fund research that will allow networks and systems to isolate attacks, gracefully degrade performance if necessary, and automatically heal themselves to a level that will allow users to be confident in using the networks and the information on the networks.

Integrity Restoration

DoD does not have a methodology for restoring integrity in its systems. If a user loses trust in a system, because of an attack (internal or external), or because of a perceived problem, there is a need to validate that the system is performing all functions accurately. Trust in a system can be lost as a result of bad data, natural events, degraded performance, fear of tampering, inconsistent data or decisions, or anything that causes the user to question the usefulness of the system. Tools and methodologies are needed to address system user questions such as:

- Was something done to the system?
- What was done to the system?
- Is the system OK?
- Is the data reliable?

Only if the integrity of the network can be assured to the satisfaction of the user will the system be used as intended.

Recovery and Reconstitution

When a network or system is successfully attacked, there is a need to return it to a useable level of service and ensure that the same attack will not produce the same negative result. Recovery is the process of taking a system from an unacceptable level of performance to a minimum level. Reconstitution is the process of taking a system from the unacceptable or minimum level of performance and returning it to full performance. In addition, the reconstituted system should not be susceptible to fail in the same way from the same attack. The ability to recover and reconstitute a system will increase trust, improve protection against future attacks, and provide systems that have increased availability.

Page 1004 of 3957

ATTRIBUTION

Once it is determined that a network has been attacked, automated tools are necessary to understand exactly who initiated the attack. Attribution is essential to establish the attacker's motive and to determine an appropriate response.

Observed and reported attacks against DoD computer networks are growing at a rapid rate. As better defense audit tools become available, the number of incident reports will most certainly increase. In general, it is impossible at present to determine the origin and intent of the incident originator. Such incidents could be the result of accidents, curiosity, thrill seeking, intelligence gathering, or deliberate attempts to damage DoD computer networks. The identification of the originator of the incident is one of the pieces of information necessary to scope the response. However, attribution tools are slow at best, are complicated by legal issues, and often fail to reach the masked identity of a skillful attacker.

An extensive R&D program focused on attribution needs to be developed. This is an area where extensive civil, law enforcement, and DoD interaction is essential. Some suggested areas of research include those that follow.

Message Signature Processing

Advanced research is needed to develop algorithms that transform extremely high-bandwidth Internet traffic channels into near-real-time searchable signature spaces such that an attack can be quickly correlated against the passively collected signature stores at multiple nodes. Near-real-time correlation capabilities could narrow the potential set of attributable source points and facilitate rapid engagement of appropriate traps and traces.

Active Code Beacons

Attacks that rely on covert target responses could theoretically be co-opted by the infusion of active code beacons in the return traffic – beacons that would provide attribution information. Research is needed to develop this and other active attribution concepts.

Identification Friend or Foe (IFF) tools

Research in this area would determine if the Identification Friend or Foe concept could be extended to cyberspace to support authentication functions with minimal resource requirements.

Page 1005 of 3957

Page 1006 of 3957

CROSS-AREA RESEARCH

There is a broad category of needed R&D that does not fit within the attack phases described earlier, but rather is common to most or all of them. Precisely because of this somewhat non-specific nature, there is much less research being conducted than necessary for the long-term health of the GIG and DoD's overall information infrastructure. In most cases, this R&D lacks a logical "ownership" – it often does not fall clearly within the responsibility of an organization or an industry, and as a result is insufficiently funded.

Below we provide a list of what this Panel believes are the most important areas of research that cut across the attack timelines. Each is discussed in turn.

1. Modeling and Simulation
2. Theory of Vulnerabilities
3. Interdependencies
4. Broad-Based Fundamental Research
5. GIG Research Coordination

MODELING AND SIMULATION

Progress in defending and protecting the GIG will require a far greater ability to model and simulate the performance of information infrastructures than we have today. Currently, much of today's modeling and simulation is based on ad hoc, relatively inaccurate techniques that are specially – and slowly – developed for each specific application. Advanced modeling and simulation techniques will be necessary to characterize and observe the behavior of networks and systems, especially under stressed conditions. Such capabilities will be essential to using an IA test bed effectively. A successfully executed R&D program should result in tools that accurately characterize a wide variety of information infrastructures. Even more advanced versions would allow a rapid, automated way of performing such modeling and simulation exercises.

THEORY OF VULNERABILITIES

Neither system administrators nor commanders can fully rely on today's vulnerability analyses, which are ad hoc, incomplete, unreliable, and unrepeatable. Although some ad hoc analyses can be useful, no theory or associated science exists whereby vulnerabilities can be systematically and completely discovered, assessed, and measured in terms of their effect on operational readiness.

As has been pointed out in earlier studies, one of the most significant gaps in IA research is system-level security engineering, particularly in the area of system-level security architectures. System-level security engineering must be further supported by basic research in IA fundamentals, particularly in the areas of availability and integrity.

INTERDEPENDENCIES

To date there has been very little research into the interdependent effects that can accompany the interconnection of multiple infrastructures, both of the same general type and completely

Page 1007 of 3957

different ones, e.g., the interdependencies between information networks and the electric power grid. The possibility of cascading and nonlinear effects from such interdependent systems is rhetorically acknowledged but little understood or studied. While responsibility for networks or other infrastructures is often easily identifiable, no organization has an institutional responsibility for interdependent effects. As networks and infrastructures become ever more tightly interconnected, the likelihood and magnitude of such effects will become greater.

This research would seek to understand the nature and origin of interdependent effects and how they propagate between and among infrastructures of varying degrees of complexity. Feedback control theory, network analysis, advanced modeling techniques, and other disciplines would be used in conducting this research, which would seek to assess both intentional (hostile) attacks and naturally occurring instabilities (such as network "storms"). As research progressed, infrastructures with increasing numbers of nodes and interconnections would be studied. At some point, an IA test bed would become an invaluable tool for such analysis.

This research program would seek to shed greater light on the mechanisms and modes of propagation of interdependent effects and suggest technical, management, and policy steps that could serve to both reduce the likelihood of these effects occurring and damp them out once they occur.

Broad-Based Fundamental Research

There is relatively little fundamental research on information science, network theory, and network failure. In the private sector, the chief focus is on product development. Private-sector research rarely looks beyond a two-year time horizon. Government and academia have more of a charter to do this kind of research, yet they are not as attuned to needs as is the private sector. At an October 1999 meeting at the White House, the chief technology officers of 15 telecommunications and information technology companies agreed that the private sector had little incentive to conduct such research, although they, along with academia and government, certainly had the necessary resources.

GIG Research Coordination

Management of IA R&D in DoD is fragmented and not focused to meet the rapidly changing threat environment.

The recognition of the GIG as a weapon system calls for a different model for the planning and execution of an IA R&D program to support system implementation. A focused research program will involve academia, industry, and government researchers. Other findings in this report have identified areas where increased funding needs to be applied. This report also points out that the IA environment has changed significantly over the past four years and is likely to change rapidly in the coming years. Such rapid change requires that a flexible R&D plan be developed, one that maintains a balance between near- and long-term problems.

The GIG Executive Office established by the Information Superiority Board (see Architecture Recommendation #1) will develop an R&D plan to execute the additional funding recommended by the DSB.

Page 1008 of 3957

- The plan will be developed in cooperation with the Under Secretary of Defense Acquisition, Technology and Logistics, the Assistant Secretary of Defense C3I, service laboratories and centers, and appropriate DoD agencies.
- The Information Superiority Board will approve the plan.
- The approved plan will be executed through existing DoD R&D activities (service laboratories and centers, and DoD agencies).

In conjunction with increased research, there is a need to increase the number and quality of people available to conduct IA research. While progress has been made in IA R&D over the last four years, the number of qualified researchers to conduct required research does not meet demand. There is a need to attract more students and faculty in IA research areas. Consistent funding levels and long-term commitments to specific technical thrusts are needed to have a significant impact on the academic community. Qualified researchers will not only allow for increased amounts of research to be performed, but it will also provide a talent pool for industry and government to reduce current projected hiring shortfalls.

Costs

The Panel was briefed on existing DoD IA and related R&D programs, which were noted earlier. These programs are budgeted at about $350-400 million per year. Given the major role that the GIG will play in the decade ahead, this figure represents a serious underfunding of a critical defense requirement. The Panel's first compilation of R&D that would make a useful contribution to the IA challenge had a total five-year price tag of $3-5 billion. A program of this magnitude would not only be fiscally unaffordable, but it would also likely exhaust the human resources available to execute the program. Accordingly, the Panel prioritized the research options and developed three categories of IA R&D programs.

Category 1 R&D is of the highest priority and encompasses R&D that the Panel believes is the minimum that should be added to current efforts to improve the security of the GIG. This R&D category has a five-year estimated cost of $350 million.

Category 2 R&D is intermediate in priority and is considered important to securing the GIG and providing a sustained basis on which to maintain GIG security well into the future. It has a five-year estimated cost of an additional $1.2 billion.

Category 3 R&D is lower in priority but would make useful contributions to GIG security and would minimize chances of major vulnerability surprises to both the DoD-unique information infrastructures and the civilian information infrastructures that directly support DoD. It has a five-year estimated cost of an additional $2.7 billion.

Page 1009 of 3957

These programs are presented below at their recommended funding levels at each level of funding:

	Category 1 $(M)	Category 2 $(M)	Category 3 $(M)
Scaleable network architectures, sensing, diagnosis:	15	35	80
Malicious code detection and mitigation:	15	30	70
Self-healing networks and systems:	20	65	150
Remediation, recovery, and reconstitution:	30	100	250
Attribution, traceback, forensics, tagging:	25	75	170
Advanced IA modeling and simulation:	30	130	300
Global key management and scalable global access control:	20	55	140
Integrity restoration:	15	50	120
Advanced steganographical techniques:	10	35	80
Metrics research:	10	35	80
Interdependent effects:	15	40	100
Advanced network sensors:	5	25	60
Cyber intelligence tools:	5	35	80
Mobile code security:	10	35	80
Anomalous behavior detection:	5	20	50
Fault-tolerant systems:	15	45	100
High-speed encryption:	40	75	180
Network fault management:	5	20	50
Network isolation:	10	30	60
Electronic friend or foe identification:	5	20	50
Theory of vulnerabilities:	5	20	50
Automated vulnerability assessment tools:	10	20	50
Advanced visualization tools:	5	35	80
Advanced intrusion detection and monitoring:	10	25	60
Attack pattern discovery:	5	35	80
Advanced biometrics research:	0	15	40
Integration tools for coalition warfare:	5	10	50
Research on related societal-issues:	5	35	100

Page 1010 of 3957

CONCLUSIONS AND RECOMMENDATIONS

The rapid advances in information technology and telecommunications have created a comparably accelerated need for a vigorous, sustained, and balanced program of information assurance R&D. This Panel emphasizes in the strongest possible terms that the IA R&D challenge will be dynamic, growing, and likely never-ending. There are several reasons for this:

- Those who would wish to attack our information infrastructures will constantly be developing new techniques to do so.
- The rapid advances in information and communications technology mean that as the years pass, entirely new infrastructures embodying new technologies will emerge – and each will be accompanied by its own set of new vulnerabilities.
- These new technologies will offer entirely new tools to those who would attack these systems.
- As both current trends and the dictates of complexity theory suggest, systems will become ever more tightly connected and coupled. This will provide new avenues for non-linear and interdependent effects to exhibit themselves, whether through attack or just non-hostile information "storms."

The Department has been alert to the issues that the IT revolution poses to the composition of future forces. However, the Department is:

- Not addressing its IA R&D personnel requirements with sufficient aggressiveness or creativity, which will likely lead to more serious problems in the next few years as more personnel leave the Department and fewer high-caliber R&D managers remain. Although this topic is addressed more extensively by another Panel report, we believe it is so fundamental that we also need to emphasize the finding. Education and training issues must be among the very first steps that the Department should take in this area. As urgent as other IA technology issues are that we discuss below, this issue is the highest priority in the technology area. Without enough qualified and well-trained technical people, virtually all of the issues in this field that the Department faces will be made much worse.
- Providing insufficient R&D funding to help ensure that the GIG, on which it is placing virtually complete reliance for all future operations, will be secure enough that decision-makers and field commanders will have confidence in the system.
- Managing its current information assurance R&D in a fragmented way that is not sufficiently focused on the information assurance requirements of the GIG. The Department is strongly committed to the Global Information Grid. This commitment requires that those responsible for building and managing the GIG must implement a more robust IA R&D program to assure GIG security in the future.

While the Department's information assurance capabilities are today increasing with time, its dependence upon its information infrastructure is increasing even faster. Unless the Department moves aggressively to address its IA R&D issues, the vulnerability gap will definitely increase.

Page 1011 of 3957

To strengthen information assurance, the Panel recommends changes to DoD R&D management. Specifically it suggests the following:

- Establishing an information assurance R&D office within OSD that reports to the GIG architect.
- Providing funding of IA R&D *above the current baseline* to this IA R&D office. The actual R&D should then be executed through DARPA, NSA and the service laboratories. Over time, we believe that much of the existing baseline R&D should be shifted to the IA R&D office.
- Providing the IA R&D office with the flexibility to shift some level of funding to meet rapidly emerging threats and vulnerabilities.

Finally, it must be emphasized that these technologies will require *new* investment. Moving resources from minimally-funded protection activities to network restoration activities will not result in an acceptable solution to either problem. Establishing a new milestone of consequence management calls for additional funding. Since the commercial world has largely ignored this issue, solutions will have to start with a vigorous DoD R&D program. This Panel believes that the minimum R&D investment that should be added to current efforts to improve the overall security of the GIG is $350 million over five years– about twice the level of funding today.

EXECUTIVE SUMMARY

Although the Department of Defense (DoD) has responded to most of the recommendations of the 1996 Defense Science Board (DSB) report[1], progress has been hampered by an incomplete policy framework, insufficient funding, and, most significantly, the fact that the Defensive Information Operations (DIO) challenge has grown more difficult. The goalposts have been moved during the play. The entire DIO landscape continues to be populated with conflicting definitions and policies, unclear roles and responsibilities, and apparent competition among the information operations, information assurance, and critical infrastructure protection (IO/IA/CIP) policy focus areas. The General Accounting Office and DoD Inspector General's office, in several reports[2] issued since the 1996 DSB report,[3], have identified persistent policy and resource issues associated with IA implementation. The National Security Telecommunications and Information Systems Security Committee (NSTISSC) raised the same concern in its *Ninth Assessment of the Information Security Status of Government Systems.*[4] The Organization and Operations Panel recommends improving this situation by declaring a moratorium on changes to existing IO/IA/CIP-related definitions, while progressing toward agreement on definitions for terms used in common by the DoD and intelligence community, but for which agreed definitions do not now exist. Simultaneously, the panel recommends that specific service- and agency-level policy documents be prepared as required to locally implement aspects of policy established at the Secretary of Defense/Office of the Secretary of Defense (SecDef/OSD) and/or Chairman of the Joint Chiefs of Staff (CJCS) level. The panel recommends the Network Operations (NETOPS) framework be adopted throughout DoD, with Commanders-in-Chief (CINCs), services and agencies collocating their network management and IA/computer network defense operations in the same center. The panel further recommends that the U.S. Space Command be authorized to establish a DoD-wide DIO threat detection and warning capability, using the modified GIG as a technology baseline. This capability should include a feed to the National Operations and Intelligence Watch Officer Network (NOIWON) system. The panel also recommends that a Defense Science Board study be commissioned to specifically address information-attack (cyber) indications and warning.

The panel recognizes that few of the needed improvements cited in this report will come free of cost. However, seen against the value of the underlying equities, the resource requirements identified are small. More to the point, the panel recognizes that military operations and national security, writ large, cannot be successfully prosecuted in the information age without heavy reliance on networked information technologies in public and private hands. Military operations and national security activities must acknowledge and plan for the unintended consequences of commercial infrastructure interdependencies, and networked information technologies must be ever more secure, reliable, and available to meet the full range of foreseeable scenarios and

Page 1021 of 3957

contingencies. There is simply no other option. The panel recommends that DoD develop a DIO funding strategy and profile, establishing priorities where sufficient funding does not exist; continue to conduct front end assessments (FEA) to shape DIO issues for program and budget decisions; establish a program element (PE) structure for all DIO resources; require mandatory migration of all DoD DIO resources into the new PE structure; address DIO requirements in the Joint Requirements Oversight Council (JROC) (CINC/Service participation); and establish program funding support for DIO requirements. Fully staffed requirements and Planning Program and Budgeting System (PPBS) visibility of all information assurance activities, especially the services' execution of Title X "staff, equip, and train" responsibilities, will greatly assist the U.S. Space Command in planning and executing its more focused and limited operational missions of computer network defense and computer network attack.

The "human face" of DIO is seen through qualitative and quantitative assessment of personnel – military, civilian and contractors – engaged in critical information-protection functions. The panel has identified serious deficiencies in each of these areas, while recognizing that the primary threat to total system security takes the form of trusted – but untrustworthy – insiders. Absent a broad based and sustained effort in the areas of hiring, training, retention, and security, all progress and expense associated with DIO hardware and policy could be for naught. The panel recommends DoD provide recruitment, retention, and proficiency pay for critical DIO skills (authorities exist to do this); develop formal career paths for DIO officer, enlisted, and civilian personnel; develop an outsourcing strategy to complement DoD key DIO resource needs; establish policy to develop and implement formal education training and awareness (ETA) programs for DIO; and require contractor personnel performing outsourced DIO functions to meet ETA criteria required for government employees. Furthermore, the panel recommends that the department strengthen and expand the role of the Reserve Component in DIO by implementing the Reserve Component Study and the DSB Task Force on Human Resources Strategy Study recommendations.

The panel focused primarily on the operational readiness aspects of DIO given its belief that Joint Vision 2020 cannot be achieved without assured access to information. While topics such as policy, personnel, and resourcing are closely related matters of concern, the readiness of joint forces to protect their access to superior information is the prime consideration. Readiness itself can be dissected into issues of metrics, the adequacy and currency of doctrine, rules of engagement, etc. Supporting processes such as red teaming, while addressed in the 1996 DSB report, have not progressed satisfactorily, and existing efforts fall far short of visible needs in this area. The panel recommends DIO be integrated into all operational mission planning to better assure information superiority; DIO be incorporated into formal readiness reporting mechanisms to better measure unit readiness; DIO red teams be formalized and empowered throughout the DoD to stress and evaluate readiness; and computer emergency or incident response teams (CERTs/CIRTs) be established and supported in the department to provide standard alerting and emergency response procedures.

The point is made in the Policy section of the DSB DIO report that national-level policies are deficient in this area. At the same time, policy discontinuities exist both internally in DoD and between DoD and other components of government necessarily engaged in total governmental DIO efforts. Issues of concern in their own right, these unresolved policy debates also stymie efforts to achieve much-needed progress in areas of resource management and training.

Page 1022 of 3957

INTRODUCTION

The Organization and Operations Panel met between January and August 2000 to review DoD policy, military readiness, organization, training, and resources, and the relationship of each to DIO. Its charter was to examine how the department is organized to execute DIO missions and maintain its readiness for DIO operations.

In the course of conducting this assessment, the Organization and Operations Panel met as a group, received briefings, and considered topics related to its mission, while also participating in task force-wide meetings and discussions. This approach permitted division of effort to focus on the categories of activity listed below. At the same time, it also facilitated identification of cooperative associations between and among issues. An example of the latter would be the relationship between structured readiness reporting by operational units and special-purpose units such as Red Teams. Readiness is measured against defined standards. Red Teams have specific criteria that they operate against which may or may not address those standards, but are a test against a stated level of readiness.], engaged in the level of readiness against defined standards. To provide some background support for proposed recommendations, the Organization and Operations Panel sponsored a DoD questionnaire about Information Assurance (IA) activities to solicit input on issues of concern to the DIO Task Force. The questionnaire results, analysis, and conclusions are provided in Appendix D to this Annex.

The Organization and Operations Panel identified four major categories of findings related to the DoD's execution of the IA/CND/DIO mission areas. These findings are supported by the survey results and are organized into the focus areas enumerated in Figure 1. Discussion of the panel's findings and recommendations follows.

1. Organizational Policy
   - 1.1 Policy and Definitions
   - 1.2 Organizational Roles, Missions, Responsibility Confusion
   - 1.3 Collocation of Network Management and Computer Network Defense Operations
   - 1.4 Threat Warning and Attribution; Indications and Warning
2. Resources and Management
   - 2.1 DIO funding throughout DoD
   - 2.2 Program Element Structure
3. Personnel Issues
   - 3.1 Career Path Management
   - 3.2 Education and Training
   - 3.3 Know Your Insider
   - 3.4 Reserve Component
4. Operational Readiness
   - 4.1 Integration of DIO into mission planning and execution
   - 4.2 Readiness Assessments, Reporting, and Metrics
   - 4.3 Red Teams
   - 4.4 Computer Emergency Response Teams

Figure 1 - Organization and Operations Panel Focus Areas

Page 1023 of 3957

I. ORGANIZATION AND OPERATIONS POLICY

A. Policy and Definitions (Internal to DoD and the Intelligence Community)

FINDINGS: Conflicting definitions and usage related to IO, IA, and CIP within the DoD and Intelligence Community (IC) causes resource and equity fights within the national security community and inhibits progress in resource management, training, and other important areas.

DISCUSSION: This problem exists on several levels. Some DoD/IC definitions and terms are not fungible across government and/or acceptable within the civil sector working cooperatively with government on critical infrastructure protection; those issues and recommendations are found elsewhere in this report.

Traditionally, the Defense Department and intelligence community have worked closely and cooperatively on many issues of great importance to national security. DIO is another issue requiring close inter-working, given the importance of the mission and clear need each organization has for the other in this still-new area. However, in fact, the two are divided by definitional gridlocks that are sometimes subtly nuanced, but behind which lie equity and resource stakes considered important by one or both parties. Some progress has been made in these areas, but many important terms and understandings remain unresolved at present.

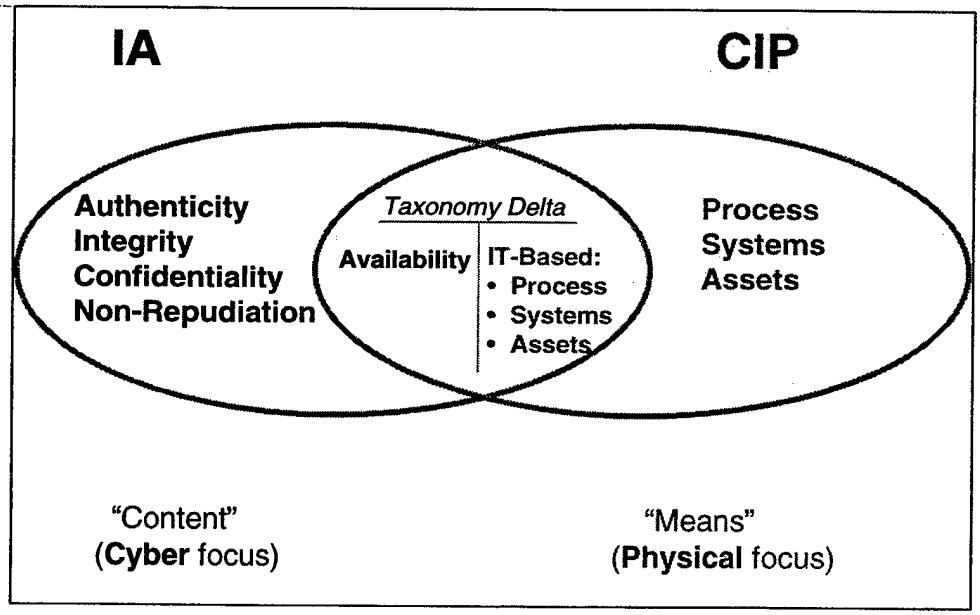

Figure 2 - OSD-Internal Taxonomy Differences: A Case In Point (IA vs. CIP)

At another level, the newness of IO, IA, and CIP within DoD has resulted in tremendous acceleration of the normal evolution of thinking on matters of doctrine, policy, organization, roles and missions, and resource priorities. The frequency with which proposed new approaches to basic definitions and organizational associations have been framed and put forward is matched only by the vehemence of the partisan advocacy for or against any such suggested refinement in

operational procedures or capabilities. If permitted to continue unchecked, the resultant continuous "churning" of the size, shape, and ownership of IO and/or its underlying parts, including IA/CIP/DIO, would significantly handicap broader efforts to inculcate awareness and support for this field within the total force.

Several of the most important aspects of a total DIO management and capability structure are dependent on a relatively stable set of definitions. For example, the goal of providing senior decision makers with the ability to sense, manage and defend "DIO resources" in the aggregate is clearly dependent on a stable understanding of exactly what is included in DIO and what is excluded Reports that have reached the task force that some resource holders have cynically "redefined" IO to include or exclude certain resources on a case basis are particularly disturbing in this regard.

Training is another area very dependent on a clear and common understanding of basic facts regarding definition, doctrine, authority, and thus roles and missions. Trainees – whether executives or entry-level personnel – all require the benefits of a broadly-based, rigorous, and progressive DIO education, training, and awareness program, as discussed elsewhere in this section of the report. All of them must hope that what they learn will remain valid for some useful period of time.

In order to assess policy for DIO, the panel created a matrix identifying public law, executive orders, national security decision directives, and DoD and other issuances. This matrix is found at Appendix C of this Annex. The extent of the matrix supports the panel's finding that policy formulation and thought development in this area has been both recent and intensive. The panel identified some ninety-five (95) policy documents related to this topic, with fully 39% of them having been authored or updated within the past three years.

Source	Total Number	Number Authored or Updated Within 3 Years	Percent Authored or Updated Within 3 Years
Public Law & Executive Branch Issuances	24	3	13
DoD Issuances	50	24	48
Joint, Agency & NSTISSC Issuances	21	10	48
TOTAL	**95**	**37**	**39**

Figure 3 - DIO Policy Assessment

RECOMMENDATIONS:

- Deputy Secretary of Defense (DepSecDef) declare a two-year moratorium, effective immediately, on changes to any IO/IA/CIP definitions reflected in joint documents (DoD DIR 3600.1, JP 3-13, etc.). Services and agencies should use this time to

prepare and publish component-level policy documents as required to implement aspects of policy established at the SecDef/OSD and/or CJCS level.

- Leadership of the Bilateral IO Steering Group (BIOSG) Under Secretary of Defense (Policy)(USD(P) and Director, Intelligence Community Management staff) agree to establish, within one year, common/agreed definitions for IO/IA/CIP terms not now resolved in joint documents.
- BIOSG develop and distribute, at the end of the one-year period of resolution, a common lexicon as an aid to facilitating government-wide IO-related definitional commonality.

Time: To be implemented by October 2001

Estimated cost of implementation: Minimal other than administrative costs.

B. Organizational Roles, Missions, Responsibility Confusion

FINDINGS:

- Roles, missions, and responsibilities of organizations in DIO conflict and frequently overlap (unclear/inconsistent chains of command).
- Concepts of Operations (CONOPS) for DIO mission execution are immature or do not exist.
- Where mission assignments have been made, lack of resources inhibits execution (e.g., USSPACECOM, JPO-STC).

DISCUSSION:

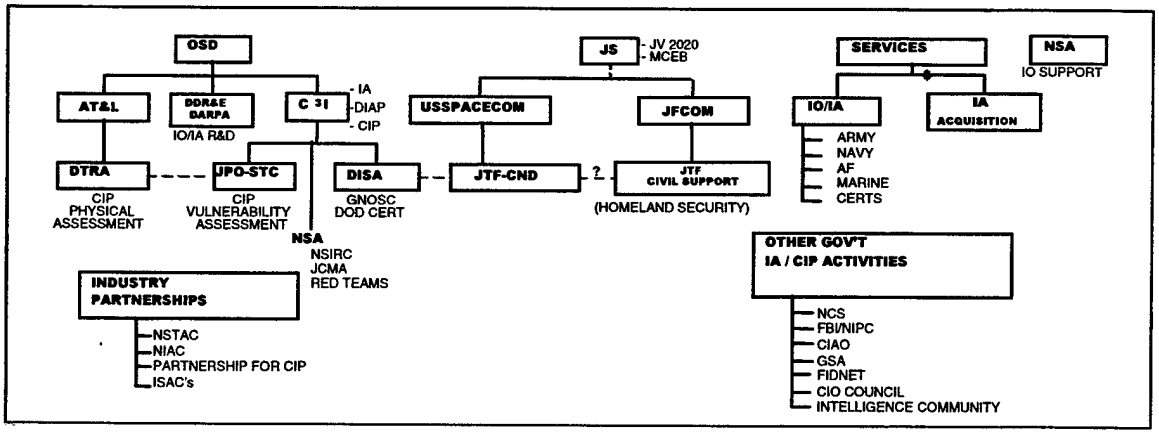

Figure 4 - IO/IA/CIP Organizational Relationships

As the concept of DIO has evolved and matured, concerns have been raised about the appropriate roles, missions, and responsibilities of the CINCs, Services, and Agencies in this

area. Recent-real world events and exercises have illustrated that clarification of who is responsible for what activities in DIO is essential. In response, the DoD established the Joint Task Force-Computer Network Defense (JTF-CND) and its component activities in 1998, along with a number of other activities and commands within the military Services to carry out those operational activities deemed necessary for this new mission area. Unfortunately, none of this activity was accompanied by clear policy on who was supposed to do what. Existing policy does not address this mission area, and extrapolation of existing policy has resulted in inconsistent interpretations of roles, missions, and responsibilities across the DoD, as illustrated in Figure 4, above. The department has conducted a number of studies, front end-assessments, and working groups to clarify the issue, but guidance in this area has fallen behind reality. Additionally, where these new missions have been taken on, funding and manpower have been taken out of hide and are inadequate to accomplish what is required. Even where specific responsibilities have been tasked, inadequate resources have hampered the activities' abilities to accomplish taskings. Specific examples of this lack of funding include the Defense-wide Information Assurance Program (DIAP), the JTF-CND, and the Joint Program Office for Special Technology Countermeasures (JPO-STC). None of the activities listed has been funded or staffed appropriately to accomplish its assigned mission.

Another problem arising out of unclear roles, missions, and responsibilities is the distinction between the entirety of DIO, IA, and CND. DIO, as defined in DoD directives and joint publications, includes all activities within IA and some additional activities. CND is an activity within DIO, but is not IA. The relationships among these activities are illustrated in Figure 5, below.

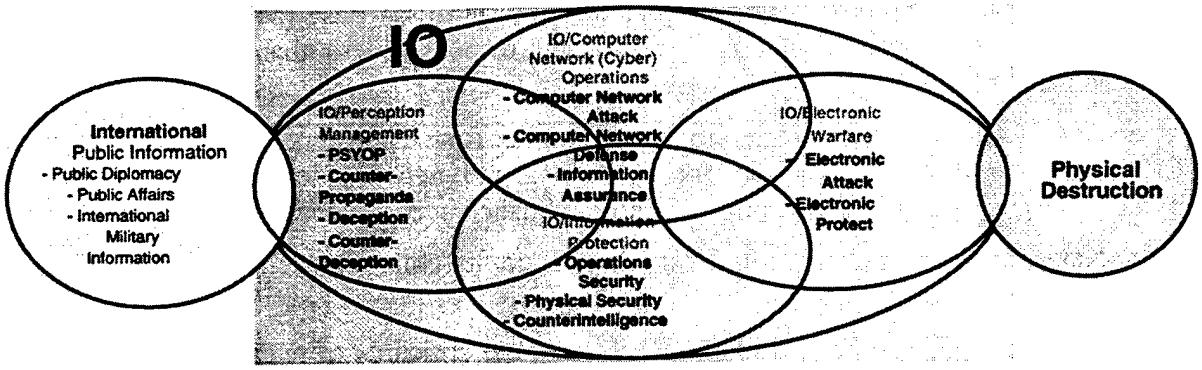

Figure 5 – Information Operations Problem Space

The problem these overlaps in responsibility present is that organizations performing these activities can and do conflict over who is responsible for accomplishing what activity. An example is JTF-CND. Its mission is specifically CND, yet it is not clear what IA responsibilities may or not be included in that mission.

The lack of clarity in roles, missions, and responsibilities has also affected those organizations responsible for carrying out Critical Infrastructure Protection (CIP) activities or homeland defense activities and their relationship to the DIO organizations. Two examples illustrate the problem: (1) the existence of the CIP and DIAP as separate entities within ASD(C3I) and (2) the responsibility of USSPACECOM for Computer Network Defense

Page 1027 of 3957

(CND)(these are titles and should be capitalized) as opposed to the responsibility of USJFCOM for Homeland Defense when there is a computer network attack against the homeland.

RECOMMENDATIONS:

- SecDef and CJCS clearly define roles, missions, and responsibilities of organizations tasked with DIO functions, including clarifying chains of command and relationships with other organizations.
- When tasking organizations to perform these additional functions, resources should be provided, along with priorities of execution of missions.

Time: To be implemented by October 2001

Estimated cost of implementation: Minimal for definitions. Resources for tasking addressed in separate recommendation.

C. Collocation of Network Management and Computer Network Security

FINDINGS: DoD does not universally collocate its Network Operations Centers with information assurance (IA)/computer network defense (CND) activities.

OBSERVATIONS: Significant operations and security synergy is being realized by the collocation of the DISA Global Network Operations and Security Center (GNOSC) and the Joint Task Force for Computer Network Defense (JTF-CND). The United States Marine Corps (USMC) Network Operations Center at Quantico Marine Corps Base (MCB) is an outstanding example of the efficiencies, security control, and responsiveness that can be provided by collocated network management and IA/CND operations.

USSPACECOM's recent efforts to establish the first Theater C4 Coordination Center (TCCC) with similar potential network operations and network security functionality is a convincing case for similar organizations being established at each CINC headquarters.

The Navy, Air Force, Army, and most agencies do not collocate their network management and security operations.

The Joint Staff Vice J6 briefed the DSB stressing the criticality of realizing NETOPS for the actual operations of the Global Information Grid (GIG).

The DSB was not briefed on, nor is aware of, any DoD initiative to establish an alternate JTF-CND location should the current DISA location be unable to support GNOSC/JTF-CND operations.

The DSB is convinced the NETOPS concept proposed as part of the GIG vision has significant merit and should be adopted throughout DoD – specifically, the collocation of network management and IA/computer network defense operations in the same center.

BACKGROUND: The operation of the network, or NETOPS, is the primary means of operating the GIG. NETOPS meets these needs by means of the standardized organizational and operational integration of three functions: network management, information assurance, and information dissemination management (IDM) (these are all usually referred to as titles).

Page 1028 of 3957

Network management provides visibility of extent and intensity of activity, traffic load, and throughput potential. Network management will enable dynamic rerouting based on priority, system status, and capacity. The effects of disruptions and intrusions will be minimized through allocation of traffic to unaffected available network paths. Network management will also allow the rapid reconfiguration of networks in order to isolate an incident (e.g., malicious code) to a specific location.

IA is focused on protecting information and information systems. IA provides the organized, manned, trained, and equipped workforce to guard and secure information and information systems. IA incorporates protection, detection, deterrence, and defense capabilities and processes to shield and preserve information and information systems.

RECOMMENDATIONS:

- CINCs, Services, and Agencies take appropriate action to collocate their Network Operations Centers with their comparable IA/Computer Network Defense operations.
- DISA and JTF-CND, in conjunction with U.S. Commander in Chief Space Command (USCINCSPACE), determine the optimum alternate location for collocated GNOSC and JTF-CND missions should the current DISA location become combat ineffective..

Time: To be implemented by 1 October 2002

Estimated cost of implementation: $10-25M over the FYDP

D. Threat Warning and Attribution, "Indications & Warning"

FINDINGS: Recommended improvements in GIG architecture and security provide a technology baseline to permit creation of a tactical time-sensitive, information-attack, warning sensor grid. Such a network would also support goals of assigning attacker attribution confidently and rapidly. Any plan to achieve this outcome would span the domains of policy, law, technology, and organization, and would require actions in several sectors of government, as well as private industry.

DISCUSSION: The recommended actions to secure the GIG architecture, taken together, have the effect of "raising the bar" of protection for DoD information infrastructures. At the same time, however, the panel acknowledges that at least some attacks will succeed in penetrating the security of the GIG. In all cases, there is a need and value in understanding that someone is trying to penetrate and degrade the GIG, even if the attack is not entirely successful. The ability to rapidly, reliably, and confidently identify, characterize, and attribute information attacks against the GIG – and thus, against the nation – is a major national security requirement in the information age.

The recommendations in this report that are related to technology can all be accomplished within the authority of the Secretary of Defense. However, as noted elsewhere in this report, issues related to timely sharing and use of information-attack data are currently unresolved in policy, as they relate to various equities of the federal government. If the scope of interest is expanded to include the extensive commercial infrastructures upon which critical DoD processes

Page 1029 of 3957

and missions depend, the problem becomes not merely one of policy but also of law, culture, and public sentiment.

If one may presume the availability of timely sensory inputs from GIG-derived sources as a minimum, along with commercial inputs, what remains is to identify the physical and organizational focal point(s) for conduct of an information-attack indications and warning mission, associated personnel requirements, and the chartered authorities and responsibilities those watch-standers would have, including interfaces with larger, classic governmental warning structures.

The I&W Process: Indications and Warning (I&W) is conducted today within a policy framework that assigns roles and responsibilities to a distributed set of organizations throughout the Defense Department and the Intelligence Community.

This structure is well designed to act upon the availability of credible and coherent data, permitting it to "ring the bell," rapidly engaging various authorities to respond as appropriate. However, the problem in the case of information attack is that at present and heretofore, there has been no structured sensory network to reliably provide timely data on which to act.

Precedent may be found in the North American Air (later, Aerospace) Defense Command (NORAD). NORAD is predicated upon an architecture of sensors, reporting links, and analytic nodes, supported by appropriate authorities and focused on a single – but very large, complex, and important – mission: the air defense of the North American continent. The output of the NORAD system is an input into the dissemination architecture displayed and described above.

IMPLEMENTATION: The panel sees the "NORAD model" as a potentially promising approach to information-attack detection, analysis, and warning. Using the upgraded and modified GIG as a sensory baseline, relatively minor modification to the U.S. Space Command's current Computer Network Defense charter and responsibilities would permit identification of an organizational focal point for information-attack threat detection and attack warning within the joint military command structure, feeding the existing NOIWON process as discussed above.

Having established a baseline DoD-internal capability in technology, policy, and organization, the next step will be to expand the information-attack I&W process across the federal government, with the goal a truly national information-protection regime. The information-sharing and trust issues related to this objective are readily acknowledged to be serious and complex, and will have to be addressed [or "treated as such"? treated as such will work] throughout the federal government and across the government-civil interface. The panel immediately acknowledges that the required degree of cooperation is only achievable within a process including extensive discussion and negotiation with private stakeholders; legislative and policy initiative; and continued technological effort, all of which must occur over time. There is cause to be hopeful, however, as the panel has noted the progress being made by such organizations as the National Security Telecommunications Advisory Committee, the Partnership for Critical Infrastructure Security, and other organizations. No specific date targets are established by this panel for the creation of an information-attack I&W regime of national dimensions. However, the requirement is embraced and the vision is put forward, with hope that future study groups and scholars will continue to add specificity and support to this vital initiative in the national interest.

RECOMMENDATIONS:

- SecDef modify the Unified Command Plan as necessary to authorize Commander in Chief, U.S. Space Command (USCINCSPACE) to establish a DoD-wide DIO threat detection and warning capability, using the modified GIG as a technology baseline.
- USCINCSPACE develop the required capability as a feed to the NOIWON system.
- USD (AT&L) commission a Defense Science Board study to specifically address information-attack indications & warning and make detailed recommendations for implementation of such a program.

Time: Initiate implementation by 1 Oct 2002 and reach Full Operational Capability (FOC) by October 2006.

Estimated cost of implementation: $150M over the FYDP.

II. RESOURCES

Despite all of the rhetoric and press coverage associated with the threats to and vulnerabilities associated with critical infrastructures, there is scant evidence that the Department has allocated sufficient resources--dollars, people, and leadership--to defensive information operations. *The Report of the President's Commission on Critical Infrastructure Protection*[5] and the *National Intelligence Estimate on Information Warfare*[6] both highlighted the growing vulnerabilities to our networks and the evidence that both nation-states and transnational groups are aware of the vulnerabilities and are seeking ways to exploit them asymmetrically. No nation on earth, and certainly no transnational group, can match the U.S. military "bomb-for-bomb" and "bullet-for-bullet"; however, several have the capacity, and apparently the intent, to develop capabilities that can affect our ability to plan and conduct military operations and that touch the lives of ordinary Americans in ways that are physically and economically dangerous. The physical sanctuary that the American people and their military have long enjoyed does not exist in the information age.

A. DIO Funding Throughout DoD

FINDING: The Department has not sufficiently funded protection of its networks and DIO programs. Of particular concern is the Sensitive- but-Unclassified (SBU) information critical to JV 2020. For example:

- Exploding SBU network infrastructures are at risk while pressure increases for more interconnectivity between various security domains and public domains.
- Network interconnectivity in and of itself is causing DoD to invest in non-traditional security initiatives to provide information integrity, electronic identification and authentication, non-repudiation, and availability over and above traditionally funded legacy confidentiality (i.e. Communications Security (COMSEC)) programs

---

5 PCCIP Report, Oct 1997.

6 NIE for IW, mmm yyyy.

Page 1031 of 3957

- The Insider threat is largely ignored, raising trust issues with both SBU and classified networks.
- The looming COMSEC modernization bill to replace aging infrastructure will add further strain on commitment to the SBU problem.

DISCUSSION: In 1996, the DSB recommended funding levels to address deficiencies identified in the Department's DIO budget. Since that time, the funding levels for DIO have increased only slightly in relative dollars, but the requirements and the situation regarding DIO have changed significantly.[7] In 1996, funding was primarily for classified systems. Subsequently, the Department has realized that its unclassified systems and networks that process sensitive and mission-critical information require protection, but the requirements in this arena have far outstripped the funding available [pick one] to address the problem. Although it may look to the uninformed observer that funding has increased slightly, the reality is that the problem has grown much more comprehensive in scope and funding has failed to keep up with requirements. The result is unfunded mandates and the robbing of critical long-term programs to pay for immediate short-term concerns.

Exacerbating the situation, the DoD has yet to articulate a clear strategy for funding and implementing DIO. There are documents that describe some pieces of a *strategy (DoD Chief Information Officer Information Technology Management Strategy*[8] and the Global Information Grid[9], but they are incomplete and/or immature and insufficiently detailed to provide a clear picture of the DoD's priorities in this arena. The result of this lack of strategy has been an inconsistent DIO funding profile across the Department, with components making internal decisions about what they can afford regardless of the impact on the overall needs of the DoD. In a shared risk environment, this inconsistent implementation of DIO requirements results in uneven levels of assurance, increasing the risk to all. The lack of an overall strategy, coupled with outdated, incomplete policy, also makes it difficult for the components, and therefore the DoD as an organization, to justify the increased funding levels that they need to address the requirements.

---

7 DIAP PDIT Brief of 14 Jul 2000

8 DoD DIO ITM Strategy, Oct 1999)

9 DoD CIO P&GM No. 6-8510, 16 Jun 2000.

Page 1032 of 3957

RECOMMENDATIONS:

OSD should direct the following actions:

- ASD(C3I): Develop DIO funding strategy and profile, establishing priorities where sufficient funding does not exist.
- Conduct front end assessments (FEA) in February 2001 to shape issues for the summer program reviews (PRG) of the 03-08 POMs:
  - DIO Research & Development (R&D) investment: Under Secretary of Defense for Acquisition, Technology & Logistics (USD (AT&L)) lead,
  - COMSEC Modernization: ASD(C3I) lead,
  - CND investment: USCINCSPACE lead,
  - GIG implementation investment: ASD(C3I), AT&L, J6 co-leads, and
  - Training/personnel investment: USD(P&R), ASD(C3I) co-leads.

Time: To be implemented by 1 October 2001

Estimated cost of implementation: $250K contract support to FEAs

B. Program Element Structure

FINDINGS: The current DoD DIO resource management structure hampers effective oversight and executive review.

DISCUSSION: Numerous efforts over the years have attempted to capture, categorize, and manage DIO resources with little success. In the past, DoD captured the bulk of the costs associated with protecting IT resources within its Information Systems Security Program (ISSP). While this program accounted for the bulk of the Department's information security investment, the program does not cover the following information security costs:

- Costs embedded within acquisition programs/initiatives
- Intelligence Community (IC) costs
- Costs within the operating support funds for base/camp/post/stations
- DoD law enforcement (cyber-crime activities) costs
- DARPA information security research programs
- The information security programs of those Agencies not part of the ISSP program (all agencies other than NSA and DISA)

The Defense-wide Information Assurance Program (DIAP) was tasked with the responsibility to provide "oversight, coordination, and integration of the Department's IA resource programs."[10] The DIAP has spent the three years since its inception trying to

[10] OASD(C3I) Memo, 12 Feb 1999.

Page 1033 of 3957

understand what is and is not included in the ISSP, where additional DIO expenditures within the Department may exist, and how to gain sufficient visibility into these expenditures. The objectives of these efforts have been to understand the scope of the DIO funding and where deficiencies may exist, to provide DoD leadership with the ability to make informed decisions concerning funding. A briefing was given to the DSB DIO Task Force that presented the results of that work (Annex E). It was apparent however, that visibility into DoD components' budgets to determine IA expenditures is still incomplete and the current PE structure does little to correct the problem. The panel's conclusion is that without a Program Element (PE) structure, the ability to accomplish effective management of the DoD's funding resources for DIO will continued to be hampered by lack of visibility.

There are, however, potential negative repercussions that could result from this PE structure and the resulting increase in visibility. The most significant of these repercussions is that DoD components may continue to "hide" DIO expenditures in other funding lines to ensure that they retain flexibility to reallocate internally as conditions dictate. Ensuring that the components retain overall control of their funds, with the understanding that they may receive tasking requirements that they will have to fund somehow, may reduce this activity. Additionally, DoD leadership should refrain from taxing the components' DIO resources during the next Future Year Defense Plan (FYDP) while this key information superiority area is undergoing critical and extensive change. In return, the components need to be honest about the risk management decisions they have made about what to fund and what not to fund and where shortfalls may exist. With that information, DoD has a better chance of justifying additional resources where shortfalls exist.

In addition to establishing a PE structure, DoD needs to ensure that DIO requirements, where appropriate, are vetted and approved through the formal requirements processes. The absence of this step has resulted in unclear priorities on programs and funding, leaving the components to make arbitrary decisions about what they can afford to fund. By vetting through the formal requirements processes, the DIO requirements are both documented and justified, allowing the CINCs who have a major role to play in the actual execution of the DIO mission to have a voice in funding priorities that they currently do not have. Additionally, once the requirements are formally documented, components responsible for funding can be held accountable for decisions made contrary to that requirement – something that is impossible to do under the current situation.

RECOMMENDATIONS:

Director, Program Analysis and Evaluation(PA&E), in concert with ASD(C3I), should effect the following:

- Establish a program element (PE) structure for all DIO resources
- Require mandatory migration of all DoD DIO resources into new PE structure
- Address DIO requirements in the JROC (CINC/Service participation)
- Establish program funding support for DIO requirements

Time: To be implemented by 1 October 2002

Page 1034 of 3957

***Estimated cost of implementation*:** Total IA budget for DoD should be around $3B/year, an increase of about $1.4B over the current documented funding.

III. PERSONNEL

A. Find and Keep the IT Talent

FINDINGS: The DoD shortage of IT professionals is serious and growing.

DISCUSSION: The complexities of solving the DoD shortage of IT professionals, when viewed in the larger context of the private sector, are serious. Shortages in the supply of IT professionals are not confined to the DoD – they exist for other federal agencies, nationally and globally. More than one million information technology jobs are vacant around the world and the number is likely to increase. By 2002, there will be 850,000 vacancies in the United States and more than one million in Europe.

Recruiting is difficult when colleges and universities are only producing enough IT graduates to fill half of the growing annual requirement. Several U.S. companies have begun recruiting foreign nationals to fill their IT jobs. Under the H-1B non-immigrant category of U.S. immigration law, U.S. employers may sponsor 65,000 professional foreign nationals each year. to The turnover rate among IT professionals in the private sector is 30%, five times the rate for the private sector as a whole. The private sector is, therefore, providing a number of incentives to combat these shortages.

The Department's ability to compete with the private sector in the area of compensation is limited by personnel practices and guidelines, and by law, in the case of military personnel. The private sector is able to react quickly to any substantive compensation change made in the government, making it difficult to maintain comparability in pay and benefits.], There are a few government authorities that offer limited relief.

The Office of Personnel Management (OPM) authorized specific flexibilities for civilian personnel to help address the government-wide recruiting and retention problems facing managers.[11] A recent Integrated Process Team (IPT) within DoD revealed that few of these flexibilities are being used within the Department.[12] Many reasons can be given for this situation, including an unwillingness to differentiate between civilian employees on different types of pay scales, but the most significant reason is lack of funding. As the DoD has sought to reduce its size, the funding for personnel and personnel incentives has also suffered. Instead of targeting reductions to functions that are no longer needed, most activities have taken percentage reductions across the board, exacerbating shortages for key skills.

On the military side, the Services have recognized the need for key IT skills and have begun targeting recruiting and retention bonuses to encourage individuals to remain on active duty. Although these bonuses cannot compare with those offered by the civilian community, they are a tacit recognition of the pay discrepancies. Additionally, other incentives, such as choice-of-duty assignments and DoD schools are used to entice military personnel to remain.

---

11 "OPM Report, Nov 1998.

12 *IA/IT HR IPT Report*, 27 Aug 1999.

Page 1035 of 3957

Even with adequate incentives, there will be insufficient personnel with specific technical skills available for DoD. This means that a realistic approach to solving the problem must consider outsourcing as an alternative. This approach was explored in some detail by a separate Defense Science Board Task Force on Human Resources Strategy. This DSB recommended pursuing military and DoD civilian tasks only on those tasks essential to the business of governing. All others should be addressed by the private sector for those functions it does best.[13] This alternative, however, should not be seen as a way to save money, but instead as a method to augment and acquire key IT skills. A Government Accounting Office (GAO) report of August 2000 reports that there are some savings associated with outsourcing, but the documentation of such savings is inadequate.[14] Unfortunately, in the rush to outsource, little thought has been given to careful planning of what should and should not be outsourced. This planning requires a clear statement of "Inherently Governmental" that is understood and executed in a consistent way. . Although there is a policy document that describes "Inherently Govermental," the applicability to the IT arena is not clear.[15] There is a current effort to provide this clarification with an Integrated Process Team (IPT) consisting of USD(P&R), USD(AT&L), and ASD(C3I) membership. With this clarification, DoD should develop an outsourcing strategy for key IT skill sets that complement those available from DoD civilian and military personnel.

Other, more creative alternatives should also be considered. It is a well-established fact that IT personnel move around more frequently in their jobs than those in other skill areas. This fact can be a problem for encouraging individuals to take on government service if one expects that the choice is a full career choice. If it is accepted that these frequent moves are part of a valid career choice, then alternative employment programs should be encouraged that facilitate this fluid work force. One alternative may be an "Education and Training for Service (ETS)" model that requires a minimum payback of employment for education. This program could provide dual benefits in encouraging more students to consider an IT career, as well as providing education incentives with a promise of employment. It could also provide a constant refreshment of talent in a constantly changing IT environment.

RECOMMENDATIONS:

- SecDef direct more aggressive recruitment, retention, and proficiency pay for critical DIO skills (authorities exist to do this)
- ASD(C3I), in coordination with USD(P&R), develop formal career paths for DIO officer, enlisted, and civilian personnel
- Develop an outsource strategy to complement DoD key DIO resource needs
- Develop an Education and Training for Service (ETS) model – 3-5 years tenure

Time: To be established by 1 October 2001

Estimated cost of implementation: $25M per year

15 OFPP Policy Letter 92-1, 23 Sep 2000.

B. Sensitize and Train Users

FINDINGS: The DoD workforce at all levels is ill-prepared to execute the DIO mission because current training efforts are fragmented, inadequately scoped, and poorly documented

DISCUSSION: The attacks against the DoD's information infrastructure have heightened awareness of the importance of training in protecting the department's information resources against attacks. Because of the shared risk environment created by highly connected and interdependent information systems, all individuals using, administering, maintaining, and managing systems and networks must understand the threats and the policies, procedures, and equipment designed to mitigate these threats. A training continuum (from cradle to grave, from the lowest civilian and military to the highest) must ensure that all personnel understand the threat and their role in protecting DoD's networks. An analogous program that can provide insight into how training affects successful mission performance is the DoD safety program, particularly aviation safety.

Training for all users of DoD computer systems is mandated by statute,[16] with additional guidance provided by Office of Personnel Management (OPM) regulation,[17] Office of Management & Budget (OMB) circular,[18] and DoD directive.[19] In spite of this direction, user training was unevenly implemented, requiring issuance of additional guidance by ASD(C3I) and USD(P&R) in 1998.[20] This policy memo also levied an initial requirement for system administrator and maintainer training and certification. Outside of user training the level and content of training for other personnel with DIO responsibilities (i.e. systems administrators, auditors, accreditors etc) in the Department varies. In some areas there are comprehensive training programs available for all DoD personnel. Unfortunately, the Department does not take full advantage of these programs. In other cases, training has been either unavailable or too expensive for the IA workforce. As a result, the level of training for the DoD IT/IA workforce is uneven at best. The training content also varies across the Department, which is a potentially serious threat to the Department's joint warfighting capability. The previously mentioned policy did not address this issue, nor did it address training for personnel performing other IA functions, or establish a permanent, recurring requirement for those identified functions. That task was taken on by an IPT established in September 1998 by ASD(C3I) and USD(P&R).[21] This IPT produced a report that made a series of recommendations to begin establishing permanent training and certification requirements for critical IA functions.[22] The report resulted in a recently signed DepSecDef policy memo.[23]

The Department has made great strides in developing and implementing a DIO training continuum, but much work remains to be done. As the training requirements are developed, they need to not only incorporate the emerging OPM civilian personnel standards and be validated

against commercial/private sector standards (where those exist), but also included in the formal training mechanisms of the Department. Without this formalizing of the requirements into the normal training mechanisms, they will not become institutionalized into how the Department does business. Additionally, it makes little sense to require military and DoD civilians to be trained to a standardized requirement if contractors performing the same functions are not held to those same standards. The recent CIO GIG Guidance & Policy Memo (G&PM) establishes the initial requirement for these training standards.[24] Realizing that [this] may require modification to existing contracts, contracting officers need to ensure that any new contracts or modifications to existing contracts providing DIO services/functions contain standardized requirements and performance metrics to hold contractors accountable for meeting these requirements.

RECOMMENDATIONS:

SecDef (ASD(C3I) & USD(P&R), USD(AT&L)) should:

- Establish policy to develop and implement formal education training and awareness (ETA) programs for DIO throughout DoD to do the following:
    - Codify the DIO training program within the formal DoD Joint Training System (JTS)
    - Ensure DIO programs are consistent with commercial and DoD certification standards
    - Require contractor personnel performing outsourced DIO functions to meet ETA criteria required for government employees

***Time*:** To be implemented by 1 Oct 2001

***Estimated cost of implementation*:** $150M over the FYDP

C. Know Your Insiders

FINDINGS:

- Insiders are our first line of defense and the most dangerous cyber threat
- Systems administrators have the "keys to the kingdom," yet often require no special "reliability" investigations, such as those in the Personnel Reliability Program

DISCUSSION: The Insider Threat is one that has long been recognized as having the potential to cause the most damage to systems as compared to damage caused by outside attackers– both inside the government and in the private sector. An insider is identified as anyone who "is or has been authorized access to a DoD information system, whether a military member, a DoD civilian employee, or employee of another Federal agency or the private sector."[25] An insider has the

[25] Department of Defense, "DoD Insider Threat Mitigation: Final Report of the Insider Threat Integrated Process Team". 24 April 2000, p.3

Page 1038 of 3957

capability to disrupt interconnected DoD information systems, to deny the use of information systems and data to other insiders, and to remove, alter, or destroy information. Documentation of this recognition exists in many fora – including a number of DoD documents that discuss the issue and make recommendations on how to mitigate the risk of the insider. The most comprehensive of these is a recently released report listing the recommendations of the Insider Threat Integrated Process Team, chartered by ASD/C3I.[26] This report identifies the basic sources of insider security problems as (1) maliciousness, (2) disdain of security practices, (3) carelessness, and (4) ignorance of security policy, security practices, and proper information system use. The key elements of a strategy to minimize the impact of the insider threat are:

- Establish criticality of systems
- Establish trustworthiness
- Strengthen personnel security and management practices
- Protect information assets
- Detect problems
- React and respond

The report goes on to make a total of 59 recommendations in 7 areas, which, if adopted, will significantly improve the ability of DoD to mitigate the insider threat risk.

A separate report addressing training and certification issues for critical IA functions also makes recommendations to mitigate the insider threat for personnel performing critical IA functions.[27] This report specifies that personnel performing critical IA functions – defined as those that require the individual to have privileged access to networks and operating systems – require special attention to ensure that they can be trusted. These critical IA personnel include systems administrators who have the most ability and access to both protect and damage DoD networks. A third report, issued by the National Security Telecommunications and Information Systems Security Committee (NSTISSC), also addresses the insider threat,[28] as does a 1997 DoD IG report.[29]

There are many ways to address the problem, but all require knowledge of who the critical personnel are, and what the critical processes and systems are. The Y2K effort provides a model of how to distinguish between critical and non-critical systems and processes. The results of this discrimination process can provide a mechanism to focus attention and constrained resources on those systems and processes that are most critical to the Department. However, there is as yet no mechanism to identify critical personnel, although the recommendations by the Information Assurance/Information Technology Human Resources Integrated Process Team (IA/IT HR IPT) begin to accomplish that objective. These recommendations were recently approved by

27 ***IA/IT HR IPT Report***, 27 Aug 1999.

28 ***NSTISSC Report***, Feb 2001(draft).

29 DoD Office of the Inspector General, "DoD Management of Information Assurance Efforts to Protect Automated Information Systems," Report PO 97-049, 25 September 1997

DepSecDef; however, it will take several years just to identify who are systems administrators.[30] This step is absolutely essential because systems administrators are the most critical of all those who perform IA functions. Systems administrators can be military personnel who are performing this function in a full-time or part-time capacity, DoD civilian personnel (also full-time or part-time), or contractor personnel performing functions, which have been outsourced. Regardless of their status, all individuals performing these functions must be held to a consistent–and high--standard.

It is not enough, however, to ensure that those performing critical functions are trustworthy, because the most rigorous screening may still miss identifying a potential problem insider. Screening also does not prevent someone who had no intention of misusing the system initially from doing so at a later date. Therefore, monitoring of both personnel and systems must be done to detect those who are not using the system as intended. Such observation requires establishment of a clear, legal, and enforceable monitoring policy so that all personnel using the systems are aware that their activities will be monitored. This policy can also act as a deterrent to anyone who may contemplate unauthorized activity and aid in holding those accountable who violate the policy. The Department has a monitoring policy, but it needs revision to accomplish the objectives stated. The technical means to monitor are available, but require proper configuration and deployment within the network architecture.

Access control processes and mechanisms are also required to prevent individuals from unauthorized access to information and processes. Passwords can provide some measure of control, but require a management process to ensure they are regularly changed. Furthermore, the files need to be protected from disclosure and users need to be aware of their responsibility in protecting passwords. Passwords have their flaws; other access control mechanisms should be employed, such as PKI and biometrics. The DoD PKI program[31] will address many of the issues presented by access control, and the DSB DIO Task Force applauds this effort. However, deployment could be jeopardized by insufficient funding and lack of follow-up in the enabling of applications for PKI.[32] The biometrics program, with the Department of the Army as the executive agent,[33] also shows promise in addressing this issue, but inadequate funding could also jeopardize this program.

The Insider Threat is, therefore, well–documented, and numerous recommendations and programs in several fora exist that, if implemented, would significantly reduce the impact of this threat. However, a number of the recommendations have yet to be implemented. The reasons for this situation vary, but lack of resources and difficulty in developing appropriate policy appear to be the primary factors. This DSB recognizes that the Department has acknowledged the problem, but the lack of policy and resources to address a very real and growing problem is of concern.

---

30 DepSecDef Memo, 14 Jul 2000.

31 ASD(C3I) Memo, 12 Aug 2000.

32 OASD(C3I) DIAP Report Apr 2000.

33 National Security Act, 1947.

RECOMMENDATIONS:

- ASD/C3I identify those IT personnel who are critical for DIO activities
- DepSecDef mandate the following processes and procedures:
  - System administrator auditing software
  - Open-source, commercial-style background investigations
  - Peer accountability
  - Pre-employment agreements
  - Credit checks
  - Standardized procedures for access to and control of systems
  - Two-person integrity (TPI) for specific critical functions that must be accomplished on a network/system
  - Policy for system monitoring and reporting of improper/unauthorized actions
  - Contractor personnel standards identical to those established for DoD personnel in similar positions

Time: To be implemented by 1 Oct 2001

Estimated cost of implementation: $5Mper year

D. Reserve Component

FINDING: Significant personnel resource shortfalls affect execution of the DIO mission at all levels in DoD.

The *Reserve Component Study* of February 2000 was chartered to provide recommendations to the ASD(C3I) on the subject of expanding the role of the Reserve Component (RC) in domestic preparedness in two specific areas of defensive information operations: information assurance and computer network defense. The study made two recommendations: 1) bolster RC support for USSPACECOM and JTF-CND, and for the Services by strengthening the RC support to the Service component commands (Land Information Warfare Activity (LIWA), Fleet Information Warfare Command (FIWC) and Air Force Information Warfare Command (AFIWC) and 2) establish Service Joint RC Virtual IA/CND units.[34]

Virtual RC support to LIWA, FIWC, and AFWIC can provide several advantages. The increase in virtual manning could result in improved mission accomplishment and extended "normal business hours" coverage (the United States' Reserve Components in states encompass six time zones from the east coast to Hawaii); an increase in Service component commands' talent pool (RC members with high technology skills can be reassigned or recruited to perform inactive duty training near home); development of a skilled pool to man the Service component

[34] ASD(RA) Study, Feb 2000.

Page 1041 of 3957

commands during annual training periods of the virtual JWRAC virtual reservists and guardsmen; and an increase in Service component commands' mobilization base. Using the RC in these ways would require little or no addition of on-site staff or facilities. Issues that must be addressed include how to identify reservists with the right skills; the management challenge of virtual drilling; and possible Service reluctance to depend on the RC for full-time support.

Increased RC support to the Service component commands would leverage the expertise of skilled reservists with civilian-acquired skills, capable of conducting virtual operations in support of service missions. The virtual augmentation could perform portions of the service missions that are not completed due to real-world mission pressure or could augment staff during weekends and during summer months.

In addition to the *Reserve Component Study*, there were recommendations made in the *Defense Science Board Task Force on Human Resources Strategy* published February 2000.[35] The task force identified a number of priority areas for shaping both the civilian and military workforce, including the Reserve Component: 1) moving to a seamless integration of active and reserve components with a single, integrated personnel and logistics system, and 2) constituting a task force to study and develop a plan that will merge, over time, the Army and Air Force reserve units with their respective National Guards. The report asserts that the transformation is necessary to prevent the personnel problem from worsening.

According to the report, the benefits of integrating these forces include:

- An organization that supports the way the Department operates and deploys
- A more simplified relationship between the active and reserve components
- Reduced overhead from the separate administrative and support structures that exist today
- Stronger ties with U.S. communities

Although the Services have made significant progress towards the goal of full integration, now is the time to leverage that progress by eliminating the separate personnel and logistics structures under which the Reserve Component now operates. Further improvement in the presentation of forces could be achieved by the integration of the reserve force with the National Guard force. This consolidation would require vision and persistence in the face of political pressures, and the challenge would have to be taken up by both the Administration and the Congress.

The DoD increasingly relies on its reserve component to fulfill its mission, both from a resources and skills available standpoint. However, because the two systems remain separate, management of the joint configuration must be relearned each time the reserve component deploys. The report identifies several issues that will have to be addressed to make the integration a reality, including legal, psychological, and administrative hurdles that must be overcome. The report sums it up this way:

> *The Department should move to a more seamless integration of active and reserve components with a single, integrated personnel and logistics*

[35] DSB Report, Feb 2000.

Page 1042 of 3957

system. The task force recommends that the Secretary of Defense constitute a special task force to make specific recommendations to move toward a single reserve component for the Army and Air Force. However, the task force emphasizes that the move to a more seamless military force should not be delayed awaiting the integration of the reserve components, but should be undertaken as a high priority project under the current active duty and reserve organization.[36]

RECOMMENDATION:

The Deputy Secretary of Defense should direct USD(P&R) and ASD(C3I) to implement

- *Reserve Component Study* recommendations and
- *Defense Science Board Task Force on Human Resources Strategy* recommendations.

Time: To be implemented by 1 October 2001

Estimated cost of implementation:

- For Reserve Component Study: $10.5M over the FYDP
- For Human Resources Strategy DSB: as determined by the study, applicable to IT workforce.

IV. OPERATIONAL READINESS

A. DIO Integration into Mission Planning & Execution

FINDINGS: DIO is not adequately integrated into mission planning and execution.

DISCUSSION:

- Control conflicts exist between operational and support equities when services are disrupted.
- Network discipline and CND compliance are issues of concern (e.g.,training, standard operating procedures (SOPs), command emphasis).
- Issue of what Components should support the U.S. Space Command's CND mission is still under discussion.
- CINCSPACE should develop a Continuity of Operations Plan (COOP) should JTF-CND lose capabilities.
- It has not yet been determined what CND information should be posted on DOD Global Command and Control System's (GCCS) Common Operational Picture (COP).
- It is not clear what the U.S. Space Command should protect as part of its CND mission beyond the SIPRNET and NIPRNET.

---

[36] Ibid., p. 52.

Page 1043 of 3957

Integrating DIO into all phases of operational exercises, testing and evaluation, and operational assessments will better ensure that network systems fully consider DIO from design through acquisition and to integration and employment. Implementing DIO into training and plans will ensure that operational plans consider the assuredness of the information they are depending on, and that networks and network personnel are exercised and stressed to better respond when failures and attacks do occur. Planning and exercising for network attacks better prepares the on-scene commanders and operators to respond to attacks or failures in a measured and appropriate manner. Accordingly, as part of exercises and operational plans, developing a set of responses, or delineating the rules of engagement for responding, will ensure any response is appropriate, measured, and authorized.

RECOMMENDATIONS:

- The SecDef, through CJCS, should issue guidance to make DIO a key element of all military planning and operations, to include promulgating Rules of Engagement (ROE) and continuity-of-operations plans and conducting unit training and exercises.

Time: To be implemented by 1 October 2001.

Estimated cost of implementation: Approximately $500k for initial actions. Additional funding requirements will need to be identified and submitted for funding via the PPBS process.

B. Readiness Assessments, Reporting, and Metrics

FINDINGS: There is no adequate system for assessing DIO readiness across DoD.

DISCUSSION:

- Readiness assessment mechanisms are incomplete and fragmented.
- Numerous efforts are ongoing to measure IA/CND/DIO readiness of DoD activities (e.g., CJCSI 6510.04 and DIAP IA metrics efforts).
- CJCSI 6510.04 does not address or apply to all DoD agencies.
- DoD IA readiness includes assessing, evaluating, and enhancing the readiness posture of DoD IA capabilities.

The success of operational missions is now more than ever dependent on the assured and timely delivery of information from operational commanders to operating forces. Planning for, testing, exercising, protecting, and resourcing the assuredness of those systems that deliver that vital information has not kept pace with the emphasis placed on using the information in some operational manner. Yet, assuring the security and availability of information is critical to DoD's success in peace and war, and is a key element of achieving information superiority. DIO readiness must be measured, assessed, evaluated, and understood for operational commanders to understand and achieve information superiority.

The DoD's information systems have been, and will continue to be, under attack. When disruptions occur to the flow of information, either through attack or system failure, operations suffer.

- System failures are often unpredictable and unavoidable. Network operations reconstitution after a system failure depends on the skill, experience, training, and ability of network technicians.
- System attacks are also often unpredictable and unavoidable. Responses and network reconstitution to network attacks also vary depending on system administrator skill, experience, training, and ability.
- Disabling a network as a response to the threat of attack has the same effect as a successful attack.
- The ability of any given command to better face the challenge of a system failure or attack is improved through planning, training, assessment, and practice.

Policy needs to be established which will lead to a structured, mandated, and recurring DIO assessment capability across all elements of the Global Information Grid. An effective DIO readiness reporting mechanism, accompanied by a viable response mechanism to provide proactive and responsive solutions, is as important as anticipating ammunition shortfalls and assessing more traditional critical warfighting systems, and will in the end save money and conserve other resources. Many different organizations, elements, and activities must be brought together within the DIO readiness system to achieve synergy, efficiency, and effectiveness throughout all facets of the system.

Critical success indicators for the readiness system include the people, operations, training, equipment, infrastructure, and processes that characterize the DIO readiness posture of the DoD described as follows:

- People: The ability to attract and retain qualified, cleared, available, accountable, and motivated personnel to sufficiently staff DIO-related mission requirements
- Operations: The ability of CINCs/Services/Agencies to ensure organizations, procedures, and tools are effectively synchronized to execute DIO actions in order to defend information capabilities; thus providing timely, reliable, integrated, and secure information to achieve mission objectives
- Training: The ability to specify and then satisfy DIO training requirements across the DoD by external and internal education, training, and awareness programs that meet nationally and/or internationally recognized quality and curriculum criteria and that generate qualified and certified DoD DIO work force and users.
- Equipment and Infrastructure: The ability of the DoD's defense-in-depth architecture to ensure authenticated and authorized access to information across service and mission boundaries, throughout all applicable equipment and infrastructures (cyber and physical), and with adequate levels of confidence in information availability, confidentiality, and integrity while being processed, stored, or in transit
- Processes: The ability of the DoD to institutionalize across the Department measurable, repeatable, reliable, valid, cost-effective, streamlined, consistently applied, and well-documented DIO processes

Page 1045 of 3957

RECOMMENDATIONS:

SecDef, through CJCS, should:

- Promulgate guidance in the Joint Mission Readiness Review (JMRR) and other appropriate Service readiness reporting systems.
- Specify policies to hold commanders accountable for aspects of DIO readiness within their control.

Time: Initial actions by June 2001, with completion not later than June 2002.

Estimated cost of completion: $12.5M over FYDP

C. Operational Readiness Assessment (Red Teams)

FINDINGS: Due to lack of clear policy and resources, aggressive, comprehensive, effective operational Red Team activities are lacking across DoD.

DISCUSSION:

- Operational readiness assessment involves the Cyber Operations Readiness Triad (CORT): vulnerability assessments, vulnerability evaluations, and red teaming.
- Vulnerability assessments, vulnerability evaluations, and an aggressive, no-notice red-teaming program are lacking across DoD.
- Red-teaming that is being done is inadequately funded, insufficiently staffed, poorly coordinated, and hampered by lack of clear policy.
- Formal Computer Network Attack (CNA) red-teaming efforts, definition, and authorities have yet to be defined.

The purpose of an operational readiness assessment (ORA) is to examine and test an information system or product to determine the adequacy of security measures, identify security deficiencies, provide data from which to predict the effectiveness of proposed security measures, and confirm the adequacy of such measures after implementation.

The ability of a network system to survive a focused attack and continue to provide the information needed by operational commanders in a timely manner is intrinsically part of information superiority. The ability of any particular system to survive an attack can be attributed to the technical health of the system and the skill, experience, training, and ability of the system technicians. Due to the networked nature of the Global Information Grid (GIG), a weakness within any particular system may cause a vulnerability within the network as a whole.

Evaluating network technical health through testing for system upgrades and patches, proper password management procedures, and firewall standards - just to name a few methods- is necessary to ensure administrators have maintained their systems according to manufacturer updates and established procedures. Similarly, system administrators must be trained and

Page 1046 of 3957

exercised in recognizing and responding to unauthorized attacks and intrusions, from both within and without of the system. Training and assistance teams provide a vulnerability assessment of networks and help provide the local system administrators with the skills they need to maintain system operations.

The different equipment and software that make up information systems have known and unknown vulnerabilities associated with them. Timely installation and maintenance of manufacturer upgrades and patches for known vulnerabilities helps maintain a higher level of security and assuredness, but often comes after vulnerabilities have been widely known and exploited. This may put operations at risk if the military community does not aggressively test, appraise, and evaluate the hardware and software that makes up the information systems. Evaluations of hardware and software identify vulnerabilities not widely known within the public domain and permit the military to work with developers to correct the vulnerability before hackers can exploit it. This level of evaluation, however, is best done during Research Development Test and Evaluation (RDT&E) and Operational Test and Evaluation (OT&E) so that the best network systems can be acquired that meet the overall DoD information superiority objectives.

Actual readiness of in-place information systems can be measured only through the aggressive testing of a system by an independent (red) team. Red team assessments are conducted throughout the DoD, but often with inadequate resources and limitations placed on their ability to conduct an aggressive assessment. Additionally, red teams are being applied unevenly throughout DoD, which results in some commands being highly effective in thwarting network attacks while others may only have minimal capability in doing so. Also, different red teams evaluate systems using different standards and measures of effectiveness, which may lead to a false sense of security within certain commands. Since a potential aggressor seeks out the most vulnerable system to penetrate or attack to achieve his ends, this uneven approach to red teams may lead to an unrealistic sense of security when in fact, little exists.

It is important for doctrine to be developed that would guide the CORT process to ensure all of DoD is at the same level of DIO readiness. Specifically, red-team structures, authorities, responsibilities, and functions should be specified for all DoD activities, and organized in a manner to make maximum synergistic use of the teams and in-place assets. Accordingly, Operational Readiness Assessment Teams should be aligned for each of the military departments, Defense Threat Reduction Agency (DTRA) for weapons of mass destruction (WMD) purposes, NSA for DoD and national requirements, and Joint Forces Command to organize reserve forces for appropriate missions.

Operational readiness assessments should be conducted often and randomly because any introduction of a new equipment or software upgrade changes the design, and hence the vulnerabilities, of the system. Highest priority should be given to upper echelon command-and-control systems, highly classified systems, and the systems of those forces preparing for operational deployment. But each system within DoD should receive complete CORT assistance not less than every five years.

Because of the nature of networked systems, and DoD's reliance on contractors and vendors, policy should be extended to subject those contractors and vendors who are involved in applicable DoD activities to the same red-teaming standards as DoD.

Page 1047 of 3957

RECOMMENDATIONS:

Formalize and empower DIO Red Teaming throughout the DoD by:

- Developing a three-level CORT assessment capability:
  - Level I: Vulnerability Assessment (VA)
  - Level II: Vulnerability Evaluation (VE)
  - Level III: DIO Red-Team
- Establishing policy that defines authorities and responsibilities
- Expanding the number, scope, and frequency of Red Teams to include:
  - Once every 3 years for specified LAN-WAN elements
  - As soon as possible after major system/network changes
  - Prior to all force deployments
  - Not less than once every 5 years for all systems and networks
  - That include contractors/vendors to the extent it applies to those government activities
- Providing adequate staffing and resources to accomplish expanded mission
- Reinvigorating and updating draft DoDD 3600.3 to include the CORT process
- Designating NSA as the DoD element responsible for developing tools, tactics, techniques, procedures (TTP), standards, and training to operationalize ORA
- Resourcing NSA to expand its ORA team to meet mission need

Time: 1 October 2001

Estimated cost of implementation: $30M per year.

D. Computer Emergency Response Teams / Computer Incident Response Teams (CERT/CIRT)

FINDINGS: DoD CERT/CIRT activities vary in their execution and are not inclusive of all DoD CINCs/Services/Agencies (C/S/A).

DISCUSSION:

- Not all Defense agencies have or have access to CERT-/CIRT-like services for their enterprises.
- An overall DIO readiness posture cannot be clearly understood today.
- Tools, response procedures, and reports differ among CERT/CIRTs.
- Doctrine is inconsistent.

Page 1048 of 3957

CERT/CIRTs provide initial indication of external attack against DoD network systems by using automated monitoring tools to determine when unauthorized probes, scans, intrusions, and service denials occur. The information provided by the CERT/CIRTs permits a clearer understanding of the level, severity, and scope of network attack. This information is also used to alert other DoD network users of attack, and to permit counter measures to be implemented which would mitigate the attack. The sum of all this information is a significant indicator of the readiness and ability of information systems to achieve information superiority.

Today, the various CERT/CIRTs use different tools to monitor network activity and, when suspicious activity is noted, report the information using differing methods and procedures. Further, the tools the CERT/CIRTs use are based on identifying recognizable and known network security vulnerabilities, and are not easily configured to protect against emerging or changing technological threats. These differences and shortcomings mean inequities exist when CERT/CIRTs measure and assess network health, which leads to inefficiencies throughout the system or a false sense of assuredness. For the assessments to be valuable, it is important that they be derived from measurements that are accurate and timely, and able to be dynamically updated to identify and warn against the most up-to-date threats. Additionally, to be easily accessed and understood throughout DoD, the assessments need to have a common format and reporting guidelines.

Because of the nature of their mission, technicians at CERT/CIRTs are particularly adept at understanding and mitigating network vulnerabilities. Therefore, CERT/CIRT technicians provide a critical technical capability and expertise for other commands to draw from when needed, especially in preparation for or during operational employment. However, the current number of CERT/CIRTs and the number of technicians within the CERT/CIRTs, do not adequately meet all the assessment and on-site assistance needs of all CINCs/services/agencies.

RECOMMENDATIONS:

USSPACECOM, supported by OSD/JCS policy and procedure, should improve the DoD CERT structure and scope by:

- Developing doctrine/TTPs on emergency response, including a deployment policy when necessary
- Implementing CERT/CIRT clearinghouse capabilities
- Providing access to standardized and advanced tools and methodologies
- Establishing common reporting formats and a shared common database
- Developing a standardized alerting process
- Establishing additional CERT/CIRTs where needed at C/S/A

Time: To be implemented by 1 October 2001

Estimated cost of implementation: $50-70M over FYDP

Page 1049 of 3957

Page 1050 of 3957

CONCLUSION

The Findings, Discussion and Recommendations described in this report were those that the Panel felt necessary to address the situation and correct deficiencies in organizational and operational issues noted during their investigation of the state of DIO within DoD. A number of activities had been initiated by the Department in response to previous reports (both DSB and others), but were too immature to determine whether the activities would be successful or were actually addressing the identified problems satisfactorily. The strongly held opinion of the majority of the Panel members was that, although there were some technological issues to be addressed in DIO, the majority of the issues impacting the ability of the Department to execute this mission were unclear, conflicting or non-existing policies, non-existing or conflicting operational procedures and inadequate resources. Lack of success in resolving the problems in these areas will continue to hamper the Department irrespective of the availability of technological solutions. The number of activities identified within the Department demonstrates a growing awareness of this fact and the need to develop a solid foundation for action. None of the recommendations mentioned in this report are particularly new or original to the Panel, nor are they difficult to understand or implement with strong, consistent leadership from OSD. That leadership is the key to success.

APPENDIX D: ORGANIZATION AND OPERATIONS PANEL QUESTIONAIRE

1.0 INTRODUCTION

1.1 Organization and Operations Panel Questionnaire

The Organization and Operations Panel of Defense Science Board (DSB) Task Force for Defensive Information Operations (DIO) issued a questionnaire in May of 2000 to assess information assurance (IA) organizational perspectives regarding current Information Assurance functions across DoD. The questionnaire was distributed to 132 organizations, drawn from the Services, CINCs, Agencies and related entities. Each of the selected organizations is currently engaged in IA missions across a wide spectrum of functional areas. The questionnaire sought to elicit information from major IA entities to determine existing roles, mission objectives, organizational relationships, and connectivity as well as to assess the community's self-perceived level of confidence and obtain information regarding perceived needs and future requirements. The results of this questionnaire were also intended to aid in measuring progress toward meeting the specific recommendations of the 1996 DSB DIO report and to develop future policy. The questionnaire presented a series of questions to participants ranging from the identification of each organization's IA missions to the assessment of funding methods for information assurance functions.

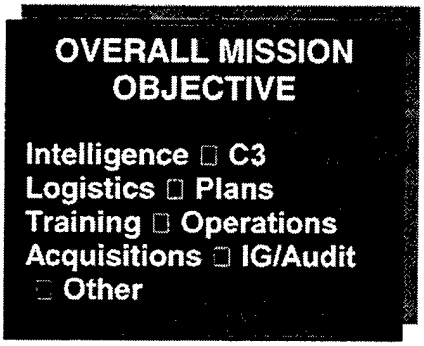
The DSB Organization and Operations Panel identified 132 organizations involved in IA activities to represent the DoD IA Community and to serve as the pool of respondents for the questionnaire. Of the 132 organizations that were sent the questionnaire, 56 responded for a response rate of 42%. Table 1 presents the distribution of the respondents by organization type.

Table 1. Questionnaire Response Breakdown

Component	No. of Responses	% Distribution
Services	38	68%
CINCs	5	9%
Agencies and Offices	13	23%
TOTAL	56	100%

The organizations that responded to the questionnaire constituted a broad cross section of overall and IA mission areas and it is therefore possible to extract some general trends from the results.

The initial questions requested the organizations to identify and prioritize both their overall and specific IA missions from the categories below:

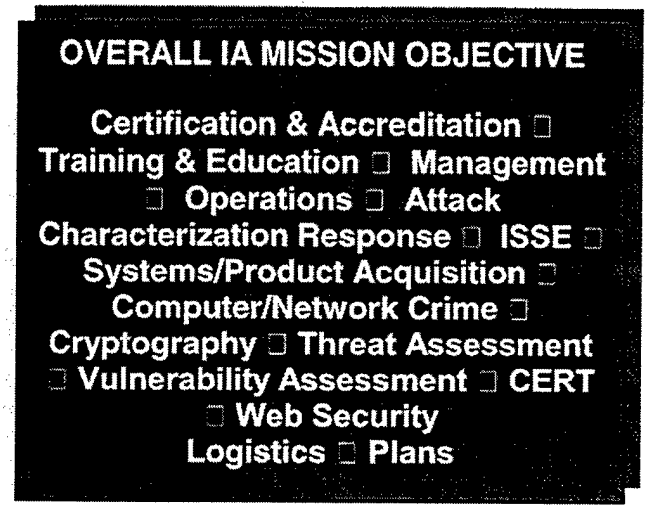


FINDINGS:

- **32% of the respondents chose C3 as their overall mission priority**
- **30% of the respondents chose "other" operations their overall mission objective**
- **14% of the respondents chose IG/Audit as their overall mission objective**
- **The remaining 24% was relatively equally divided among the remaining categories**

FINDINGS

- **31% of the respondents chose management as overall IA mission priority**
- **15% of the respondents chose CERT as overall mission priority**
- **9% of the respondents chose certification and accreditation as overall mission priority**
- **The remaining 45% was divided among the remaining categories**



The organizations were also given the opportunity to provide feedback and comments to the DSB with respect to issues of particular concern in the IA arena[1]. The comments provide a window into the opinions and concerns of the IA community that was not necessarily consistent with the specific questionnaire responses. These comments appear to suggest that while DoD has succeeded in formulating "high level" policy and guidance with respect to IA issues, the implementation of these policies in the ranks and the development of detailed operational requirements and regulations is an area that must continue to be addressed.

The questionnaire results suggest that the absence of a consistent process to implement IA policy has led to inconsistent actions being taken across the DoD. Many respondents also suggested that policy updates should be issued in a more timely manner, so as to keep pace with technological advances and to avoid the implementation of a patchwork of policy. The questionnaire responses provide a great deal of information and insight into current DoD IA posture, and identify issues that will be of significance in the near term future.

This appendix will provide an analysis of the questionnaire responses and the implied trends throughout the IA community as represented by the pool of questionnaire respondents.

---

1 *The comments are presented in greater detail in subsequent sections and Attachment A.*

1.2 DSB Questionnaire Methodology

Fifty-six organizations responded to the DSB questionnaire. Each organization was treated as an independent entity within the IA community. The analysis, therefore, strives to demonstrate a number of trends present throughout both the IA community and the Department.

The distribution of respondents is heavily Service-oriented and within that group, Army comprised the majority of the responses. However, the trends noted below appear to be consistent across all groups that responded to the questionnaire. Furthermore, the significance of the heavy Service representation is offset by the fact that the Services retain the bulk of the execution responsibilities as delineated by *Goldwater-Nichols*, and so retain primary responsibility for implementing IA programs across the Department. Accordingly, the fact that the Services constitute the bulk of respondents serves to provide an accurate depiction of the composition of the IA community on the ground. This, in turn, lends credence to the purpose of this analysis; namely to provide a window into the current state of the DoD IA community as perceived by the participants. The results also constitute a "pulse check" on the perceived availability of proper resources, policy, and funding throughout the DoD IA community.

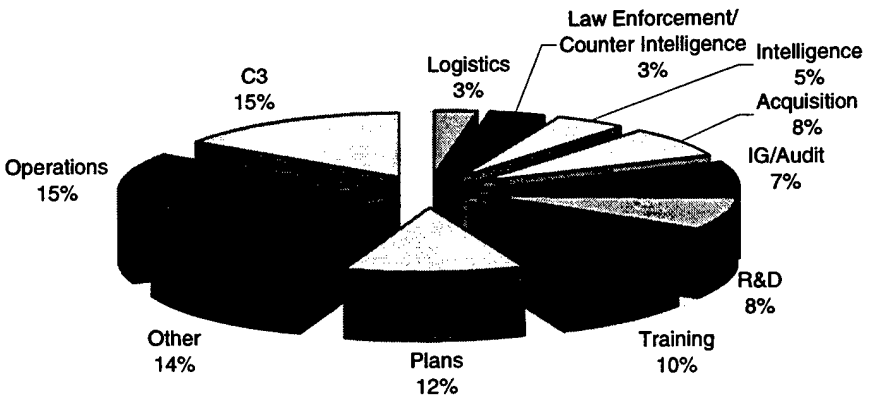
2.0 DSB QUESTIONNAIRE ANALYSIS

2.1 Mission characterization

2.1.1 What is your specific organization's overall mission and overall mission priority?

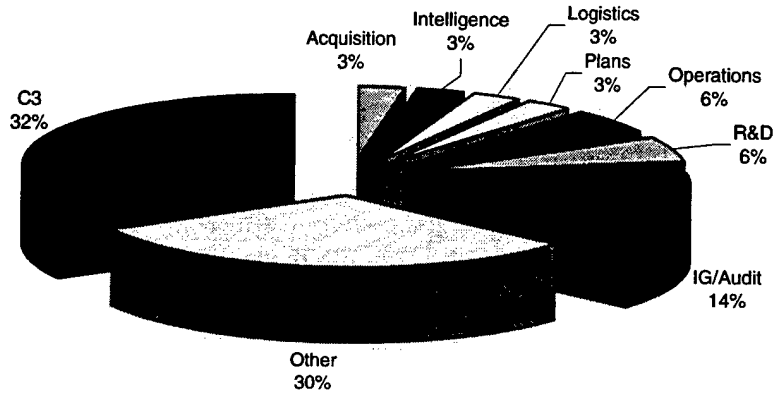
The first question posed in the questionnaire sought to capture the distribution and priority of the overall mission objectives of organizations within the IA community. Respondents were given a list of missions to choose from and requested to select all that applied to their organization. Respondents were then requested to prioritize each mission objective. Figure 1 illustrates the diverse nature of missions within the IA community. On average, each of the 56 respondents chose 2 to 3 mission objectives. Most organizations included C3, operations, and planning among their overall mission objectives.

Figure 1. DoD Overall Mission



The graph illustrates that there is a great deal of variation across the DoD IA community, in terms of mission objectives. As IA continues to gain strength and recognition as a critical element of Defense in Depth, IA issues, and the availability of IA services within the mission areas will continue to grow, placing further pressure on IA organizations for resources, training and other services. Further, while the majority of respondents are involved in C3, planning, training, or some other activity outside of the questionnaire choices, the results suggest that IA activities have become more routine, and an inherent function of DoD business processes.

Figure 2. DoD Overall Mission Top Priority



In addition to identifying their mission objectives, respondents were also asked to prioritize their overall mission objectives. Figure 2 illustrates that C3 and IG/Audit were the highest priorities identified by the respondents. The category of "other", which was the choice of a significant number of respondents, suggests that there is a sizable portion of the IA community involved in activities, which have expanded beyond the scope of the traditional mission objective choices. The results seem to suggest that IA is slowly being integrated into the routine of all organizations throughout DoD. Thus, while IA activities continue to be concentrated in organizations with a C3 mission, the results suggest that the IA community is expanding into areas such as R&D and operations.

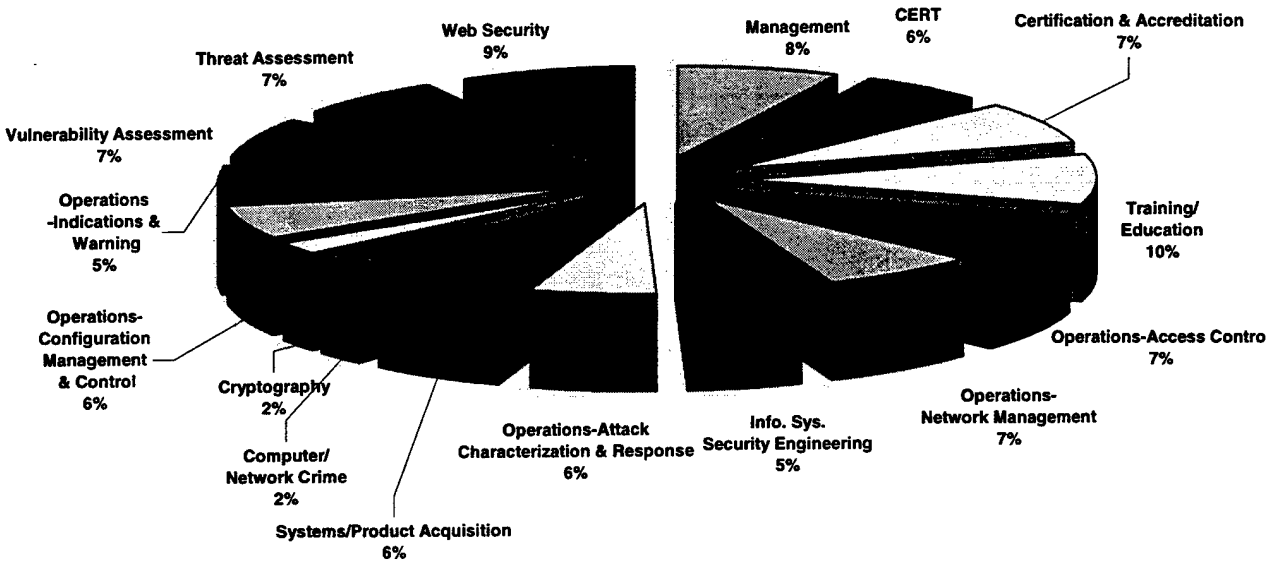
2.1.2 What is your organization's IA mission and IA mission priority?

Respondents were asked to check and prioritize the overall IA mission objectives that applied to their organization. On average, respondents chose six different objectives from the provided list. Figure 3 illustrates the distribution of the frequency with which each category was chosen.

This graph illustrates that the missions of the IA community are quite diverse and cut across numerous focus areas, with training and web security being the most frequently cited IA objectives. The graph further suggests that the IA community's activities are not simply limited to information security issues, but have also become a part of the business processes that exist in the background. IA appears to be developing into a discipline that is increasingly found in a full range of services, suggesting that IA is continuing to evolve into a mainstream activity.

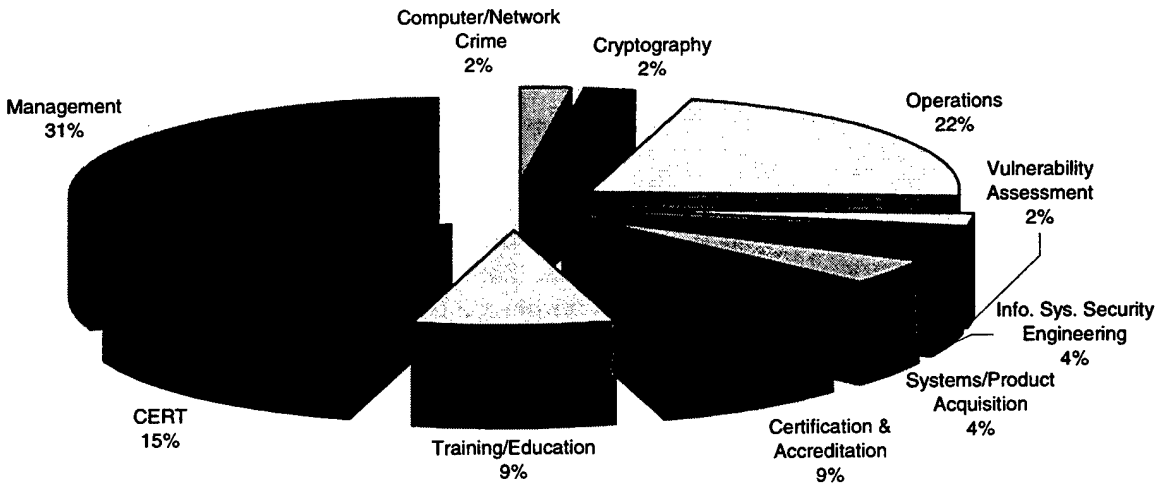
Page 1072 of 3957

Figure 3. Overall IA Mission
(Respondants were requetsed to chose all categories that applied)



The questionnaire also asked the respondents to prioritize their overall IA mission objectives. As shown in Figure 4, management was the top IA mission priority chosen by respondents, with nearly one-third of the respondents engaged in some sort of management or oversight role.

Figure 4. DoD IA Mission Priority



Further analysis of the results illustrated in Figure 4 suggests that the IA community has a clear management role, or at least believes it dedicates a great deal of resources towards general management (i.e. accounting, requirements, and funding). The frequency with which respondents chose management as a priority is consistent with the fact that IA is a pervasive issue that reaches almost every organization and activity. As there is a great deal to manage, the infrastructure must be in place to execute all IA activities and initiatives throughout DoD. Management, training, and C&A accounted for 48% of IA priorities, operations as a whole accounted for 22%, CERT accounted for 15%, and general support functions accounted for 13%. However, while these numbers suggest a great deal of variety in terms of the IA priorities throughout the community, it may also indicate that there is divide among the community in terms of mission objective.

2.1.3 Additional observations

In characterizing the IA community's "overall mission objective" and "IA mission objectives", the data suggests that the IA community continues to grow in both scope and in depth. The results also indicate that IA functions are present in a growing number of organizations with a burgeoning variety of overall IA objectives. IA should continue to expand into other organizations and mission objectives as the ability to deliver information in a safe, secure, and highly trusted manner becomes increasingly crucial to the day-to-day operations of the Department. This will be especially true as the Department's E-commerce initiative continues to grow and become standard practice.

2.2 Requirements and Resources

To achieve an overall perspective on the IA community, it is helpful to assess the community's perceptions of its ability to meet the responsibilities set forth in policy both at the departmental and organizational levels. To this end, the questionnaire sought to assess the availability of resources in the form of funding, personnel, and policy.

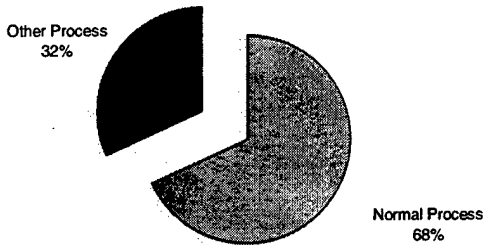
2.2.1 Have your IA requirements been identified?

Figures 5 through 8 illustrate that the respondents feel that the majority of their requirements have either been fully identified or partially identified, suggesting that they are well able to articulate their IA needs. Almost two-thirds of the respondents have been able to identify their requirements through normal processes, with organizations integrating IA into their standard requests for funding every year. This suggests that there may be sufficient procedures, processes and organizations in place to address IA issues within the PPBS cycle and the POM process.

These graphs also show that about 80% of the community is able to at least partially identify their requirements; however, 42% percent of these requirements have only been partially validated. The relatively large percentage of partially validated requirements implies that it is important to continue to investigate why there is such a substantial amount of requirements that remain only partially identified to facilitate the overall ability of the community to fund its activities.

Page 1074 of 3957

Figure 5. Requirement Identification Process



Normal process: PPBS, JROC, etc.
Other process: Vulnerability assessment or other assessment/inspection process

Figure 6. Requirements Identification Using Normal Process

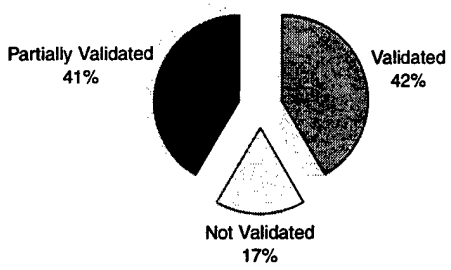


Figure 7. Requirements Identification using Other Processes

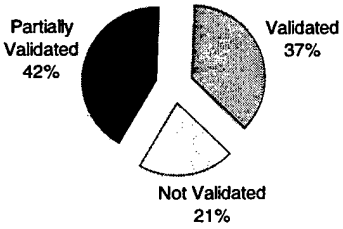

Figure 8. Requirements Identification - Process Independant

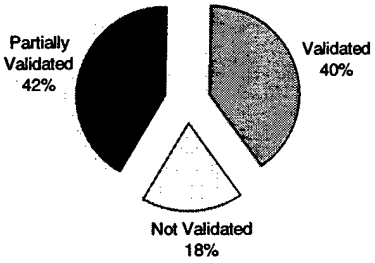

2.2.2 Have your IA requirements been resourced?

Figures 9 through 13 illustrate the perceptions among the respondents regarding the effectiveness of their investment and resources.

Figure 9. Do you have enough capital investment funding for IA?

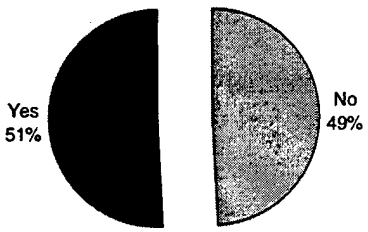

Figure 10. Do you have enough capital investment on facilities?

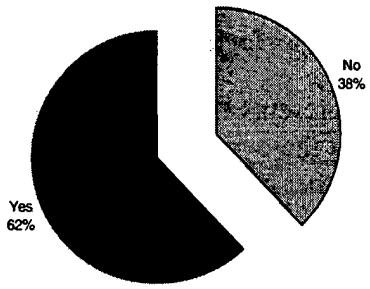

Page 1075 of 3957

Figure 11. Do you have enough of the right people working IA?

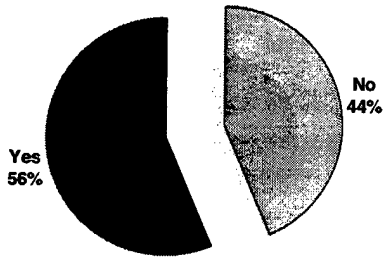

Figure 12. Are your people properly trained?

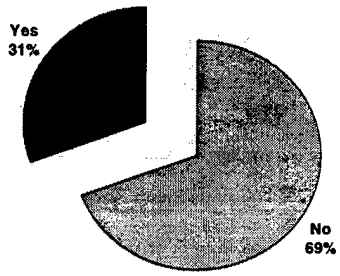

Figure 13. Do you have enough capital investment for IA operations?

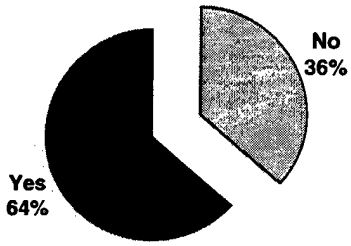


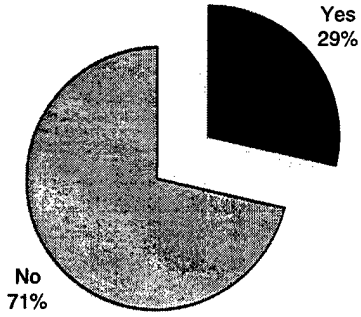
The graphs above illustrate that only about half of the respondents believe they have enough capital investment for IA in general. However, almost two-thirds of the respondents believe they have enough capital investment for facilities and IA operations. This implies that, while the respondents feel that they do not necessarily have enough total resources for IA activities, they feel they are adequately funded for facilities and operations. As almost one-third of the respondents feel they do not have the proper investment capital, further investigation would seem to be warranted.

With regard to personnel requirements, the majority of the respondents felt that they had adequate numbers of people, but that these people do not have the proper training. This correlates to the low placement of education on the IA priority list as seen in Figure 3, and suggests a need to raise the profile of IA education and training throughout the IA community.

2.2.3 Does performance of your IA mission conflict with any other responsibilities?

Figure 14 presents the results from the inquiry regarding potential mission conflict. This figure suggest that the overwhelming majority of respondents do not feel that their IA mission conflicts with their other responsibilities.

Figure 14. Does performance of your IA mission conflict with any of your other responsibilities?



In theory, an organization's IA mission should not conflict with its overall responsibilities because IA is designed to enhance the majority of IA mission objectives engaged in by the community. However, there may be instances when the practical outcome of DoD's IA policy (i.e. smart cards or PKI) may inhibit the tactical world. These services are designed to provide another layer for DoD's Defense-in-depth strategy, yet some organizations may view the additional layers of security as a liability rather than a safeguard.

2.2.4 Do you think you have the right tools to carry out your IA mission?

As a general rule, securing adequate resources in the form of funding or people is a constant challenge for any organization, regardless of the specific issue or technology. However, these issue present only one part of the overall picture. An analysis of the respondent's data implies that, for IA organizations, policy and authority tools are becoming just as important as funding. If Department policy does not clearly communicate the roles and responsibilities that Components are required to implement than it becomes nearly impossible to carry out the IA mission effectively or to cultivate change and growth.

Figures 15 through 17 suggest that while the respondents believe they have generally good information, they do not overwhelmingly believe that the proper policies are in place or that they have the proper authority over subordinates and/or organizations.

Figure 15. Do you think you have adequate and clear IA policy/guidance from above to carry out your IA mission?

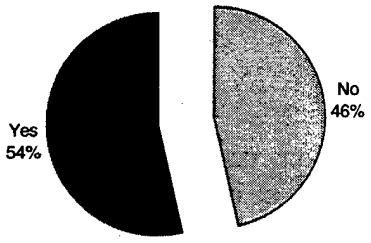


Figure 16. Do you think you have adequate authority over subordinates/organizations to carry out your IA mission?

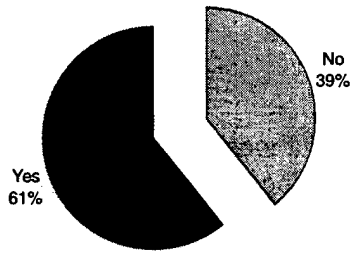

Figure 17. Do you have adequate information you execute your IA mission?

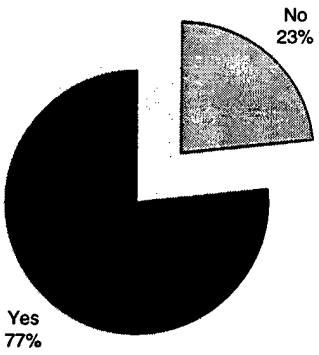


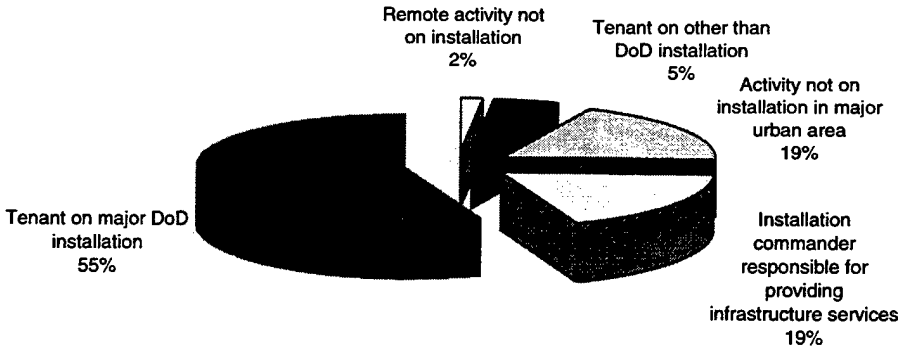
This becomes especially important in the case of Agencies and CINCs who are often dependent on the Services for the delivery of IA services. The results also point to the growing interdependence of organizations in the IA community that has developed as a result of information sharing and enhanced communication within the community.

2.3 Infrastructure Availability

2.3.1 Activity Situation

Figure 18 illustrates that the majority of DoD IA activities sit on major DoD installations.

Figure 18. What best describes your activity situation?



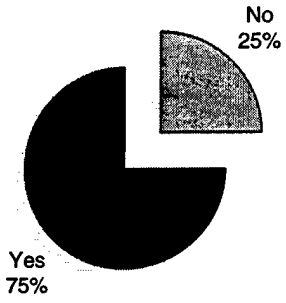
The second most common situation is activities where the installation commander is responsible for delivering infrastructure services. These may be minor installation or installations in an urban area. An additional twenty- percent of the respondents are situated in remote locations.

Page 1078 of 3957

2.3.2 Availability of DoD Infrastructure

Figure 19 addresses the availability of essential infrastructure.

Figure 19. Do you consdier DoD Infrastructure servvices in mission planning?



The results of this question illustrate that about three-fourths of the respondents consider the DoD infrastructure in mission planning. This suggests that organizations are considering both information assurance and infrastructure assurance issues, which have a symbiotic relationship. Without the availability of the various elements of the DOD infrastructure, it becomes difficult if not impossible to meaningfully execute the IA mission.

Figure 20. How do you consider DoD Infrastructure availability in mission planning?

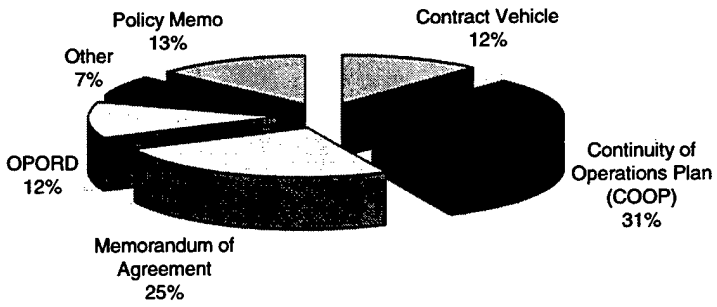


Figure 20 suggests that most respondents consider DoD infrastructure for Continuity of Operations Plans (COOPs) and for memoranda of agreement (MOA). Since the availability of the infrastructure drives COOPs and plays a key role in MOAs, it is not surprising that the respondents chose these two most frequently. In addition to assessing those situations where

Page 1079 of 3957

organizations consider infrastructure issues, it is also important to ascertain the level of an organization's confidence in the availability of infrastructure at critical times.

Figure 21. Are you confidence in that the services you require will be available whenever needed?

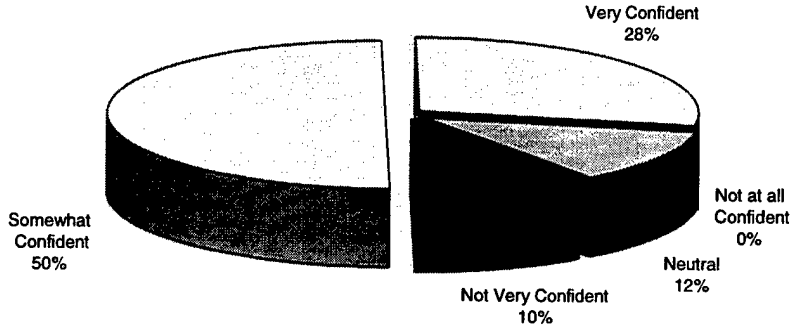

Figure 21 illustrates that only about one quarter of the respondents are confident that the infrastructure services upon which they rely will be available whenever needed, while over 50% of the respondents are only somewhat confident that the services they need will always be available. Such results suggest that there is a pronounced absence of confidence in the current ability of the DoD infrastructure to deliver services on demand.

2.4 Impact of IA Activities on Mission Performance

2.4.1 How do the following IA processes impact your mission performance?

Figures 22 through 28 illustrate the impact of IA activities on mission objectives.

Figure 22. Vulnerability Alert Process

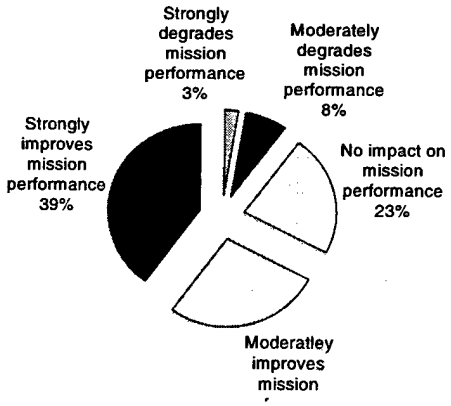

Figure 23. INFOCONS

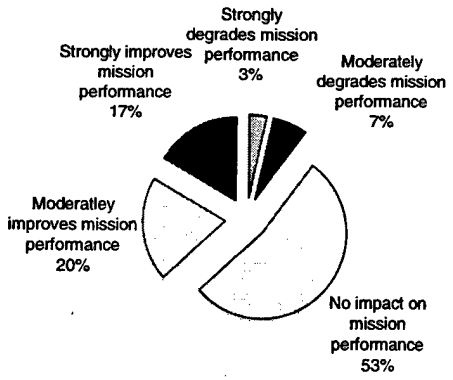

Figure 24. Incident Reporting Process

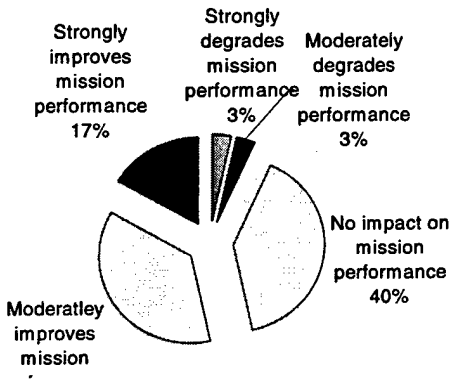

Figure 25. Accreditation Process

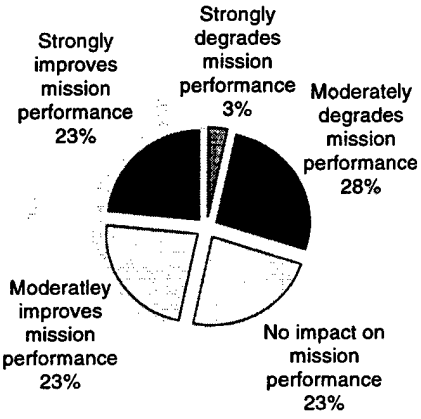

Figure 26. Vulnerability Assessment Process

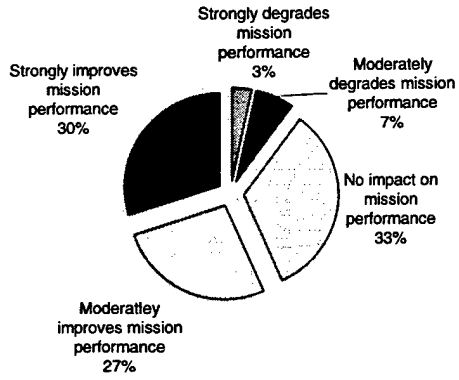

Figure 28. Recovery/Reconstitution Process

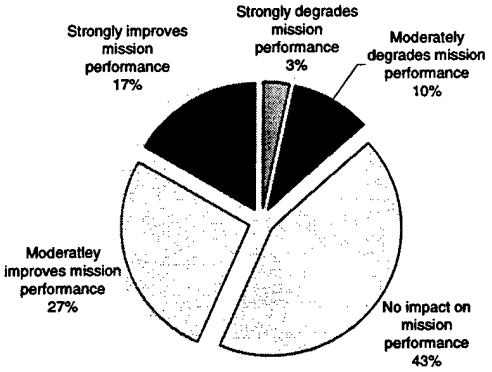
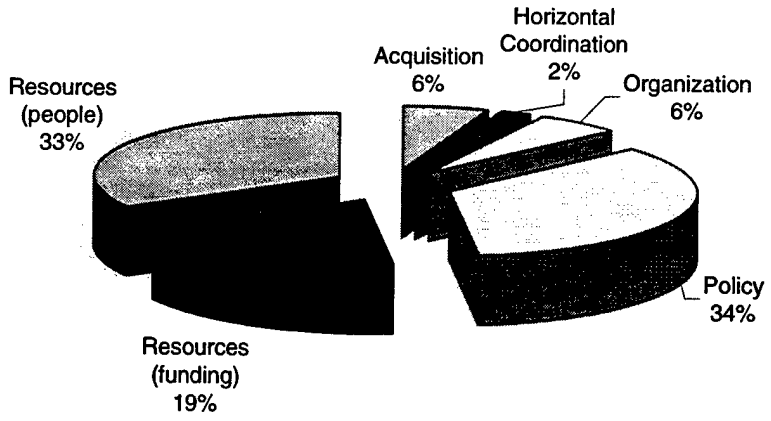


The results suggest that Vulnerability Alert Process and Vulnerability Assessment most significantly influence the respondents' mission objectives. Most of the IA activities have only very little or a moderate impact at all on mission. While virtually no IA activities have a strongly negative impact on mission objectives, threat assessment and the accreditation and certification activate moderately degrade mission performance, with respondents reporting that about one-third of the these activities were at least moderately degrading mission objective.

Page 1081 of 3957

Figure 29. Issues Warranting Attention



2.5. Issues Warranting Attention

While IA has made significant progress in expanding its reach throughout the Department, there are still a variety of issues that must continuously be examined and reevaluated. As with any program or initiative, funding and well-trained personnel will always be issues to program managers. Perhaps the most interesting result of the questionnaire analysis is the fact that policy was identified as the single biggest concern of the respondents. These results were borne out by the "*Comments*" received at the end of the questionnaire and presented in full in Attachment A.

The small numbers for acquisition, organization, and horizontal coordination suggest that communication among organizations is adequate and that the organizational structure of the IA community itself is not of great concern. However, issues such as roles and responsibilities as well as new money allocated for various IA efforts continue to challenge the organizations that are charged with implementing the changes. The concerns reflected in Figure 29 are consistent with the trend found throughout the questionnaire indicating that the community is generally confused, and in need of a greater guidance as well as policy that has more detail and applicability to their own organization's day-to-day functions.

2.6. Coordination and Interface

Respondents were asked to provide insight into the organizations they work with and draw support from in both the public and private sectors. Please see Attachment B for the results of this inquiry (i.e., a full list of organization's coordination and interface from questions 10a, 10b, and 10c).

Page 1082 of 3957

3.0 COMMENTS

In addition to the specific data represented in the graphs set forth in the previous sections, organizations were also asked to provide more general feedback on those issues not specifically covered by the questionnaire. These comments were intended to give participants the opportunity to highlight any areas of particular concern in the IA community with respect to the subject matter of the survey, and to provide the DSB with greater insight into those concerns. A frequent focus of these concerns is the expressed need for clear policy, and resources, both with respect to funding and qualified people. While many organizations responded positively to the specific survey questions directed towards the adequacy of policy and guidance, respondents' true feelings about their IA posture was clarified in the comments, and presents a somewhat less sanguine view of the state of policy at the organizational level. . This apparent discrepancy between the comments and the specific survey responses may be indicative of a desire on the part of the respondents to provide a "politically correct" response to the direct questions in the survey.

A detailed review of the comments seems to indicate that most organizations would welcome clearer policy and guidance from OSD, which would enable them to better develop policy specifically applicable to their own organizations. Many of the respondents expressed the belief that there was sufficient be "high level" policy", however, this policy was of limited use when applied to the organizational structures of the community, and their day-to-day tasks. The comments further suggest that efforts on the part of policy makers to clarify roles and responsibilities at the organizational level to facilitate the implementation of IA initiatives would be well received, as would requests for suggestions about the process at the operational level. The comments also indicated that that a lack of "low level" policy was leading to the creation of multiple concurrent and possibly inconsistent policies with respect to the delineation of varying roles and responsibilities. It was suggested that such situations should and could be addressed by undertaking a more comprehensive and wide-ranging policy effort. A related undercurrent in the comments, was the expressed desire for the IA community to begin to think and act across organizational lines and to coordinate efforts and hare information.

Respondents also suggested that policy formulation difficulties might stem from the incremental nature by which DoD develops IA policy. Which contributes to the "patchwork" of polices currently in use. This policy "incrementalism" is perceived as a barrier to timely updates, which would allow policy to keep pace with developments in technology.

Many respondents expressed the belief that the visibility of IA in the PPBS cycle must be raised in order to assure that resourcing priorities are adequately addressed in the FYDP. These funding needs are further complicated by the great diversity of IA mission objectives as represented by the survey respondents. Respondents also expressed a desire to see further discussion in order to identify activities that support multiple missions and to harness domain knowledge in support of further policy and program development and implementation. This process will be invaluable in overcoming the inherent limitations of the PPBS too allow for the full identification and validation of IA requirements in the future.

Page 1083 of 3957

A final area of concern was the IAVA and accreditation processes. There was a general consensus that the feedback and reporting loop on the IAVA process needs to be tightened, leading to better and more timely communication. Additionally, many respondents felt that the accreditation process was both too complex, and too "paper intensive", leading to delays and frustration.

Overall, the comments indicate that the IA community is beginning to view itself as a functional community that cuts across organizational lines. There is also a high level of awareness of the fact that many of the organizations are dependent on each other, as well as outside institutions, and, a broad sense of the need for better coordination and cooperation in the IA community.

4.0 CONCLUSION

The responses received to the questionnaire came from a broad cross section of IA organizations engaged across the full spectrum of IA missions. The respondents accurately reflect those organizations and components, which are charged with the primary responsibility of implementing IA programs across the DoD. The questionnaire results support the proposition that IA is becoming instantiated across all functional areas of DoD, and that while high level policy is adequate, significant work remains to be done to assure that the broad goals and objectives of DoD policy are accurately translated into usable polices at the operational level. Front line IA personnel must be provided with sufficient organizational tools and resources to competently implement their IA missions on a day to day basis. Furthermore, policy must keep pace with technology, developed and implemented in a consistent manner across the various organizations that comprise the IA community. This becomes especially crucial as the demand for IA services continues to evolve into an important element of each Component's activities.

Page 1084 of 3957

Attachment A: Noted Trends in Respondents' Comments

Unclear and Outdated Guidance from Above

We write the IA policy for the AF, however, we do not always get clear policy/guidance from OSD.

There is too much policy that is not related to performing the functions required to do the job. The problem is the incremental adding of policy over the years. We need to throw it all out and start over.

DA IA Policy needs further clarification on roles and responsibilities. Typical, rapid technology change places us in the position of not always having desired information on hand for decisions.

Adequate & clear IA policy/guidance from above - NO - as an example, there is still no clear authoritative reporting policy from JCS on IA incidents.

There are various policies out there but the focus is still at the highest (DOD) levels. The personnel putting these policies into action, need more clarity to carry out this mission.

Although large strides are being made in regard to IA/CND policies, policy is not keeping up with the speed of technology. A paradigm shift is necessary to ensure that security policy is addressed in a more timely manner.

Policy is still being formulated from the national level on down. It seems to be mile wide and inch deep. Much improvement has been made in the last two years.

Several IA policy documents are old/out of date (e.g. DODD 5200.28, Public Law 100-235, DOD 5200.28-STD (Orange Book), etc).

IA policy which addresses Certification and Accreditation (DODI 5200.40, DoD Information Technology Security Certification and Accreditation Process (DITSCAP)) is difficult to understand and use. It expanded the process via required steps and paperwork, with vague guidance. Recommend Interim Authority to Operate be allowed at completion of Phase I vice Phase III.

Question 6: IA policy between DoD and the separate services sometimes parallels or conflicts, particularly in locations where there are multiple policy makers.

Little Authority over Subordinates/Organizations

Have NO authority over service component organizations - they have their own reporting lines - the Title 10 issue all over again.

Page 1085 of 3957

As a CINC who must respond for their respective Components, we have little say when the reporting structure and infrastructure is based upon a Service-centric model. That's why we face difficulties with the real C2 of the networks, as evidenced with disparities in INFOCON levels, as just one example.

The IA organization at DSS has no real authority over subordinates/organization. IA's role is more an advisory/oversight function without true authority to control systems or system owners.

Limited Financial Resources

We are not funded adequately for that protection to be maximized to the extent necessary to protect our infrastructure. Our CO is very supportive but funding limits and sets our priorities.

NCIS is currently not funded for this mission. We have made extraordinary strides in meeting this challenge, which are not being replicated within DoD, and are maximizing the limited resources we have.

While there is guidance from above with respect to IA policy/guidance, limited resources constrain programs to a (illegible) that could be deemed unacceptable. There are several DoD mandates that DSS is not in compliance with.

A strong commitment of "resources" and "will" is required by leadership at all levels to be the warfighter's IA agency of choice!

Limited Human Resources

Finding qualified people is difficult, more so on the GS side than on the contractor side.

Accreditation is a big obstacle for us because we have so many systems and so few people.

Suggestions for Change

IA should be budgeted as a separate program to ensure you get the required resources (personnel, training and tools).

I recommend having an area IA assigned to an IG area that provides full time support and overwatch to all IG offices within a pre-determined geographic location / area support. Responsibility for all IG offices within the assigned sector or geographic locations.

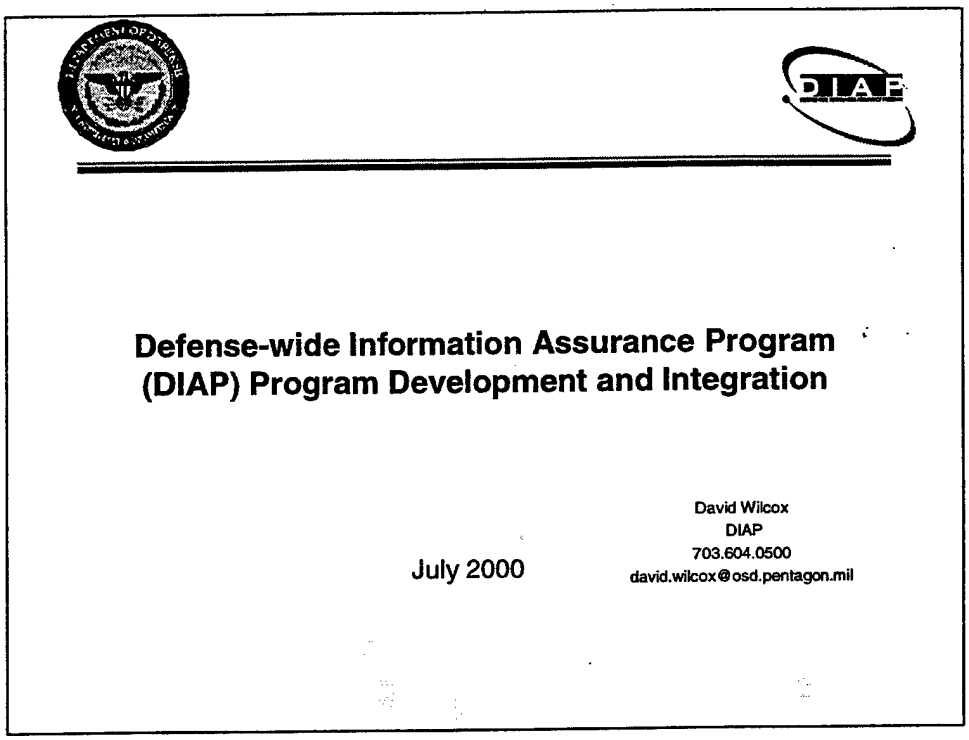
APPENDIX E. DIAP PROGRAM DEVELOPMENT AND INTEGRATION TEAM (PDIT) BRIEFING



Defense-wide Information Assurance Program (DIAP) Program Development and Integration

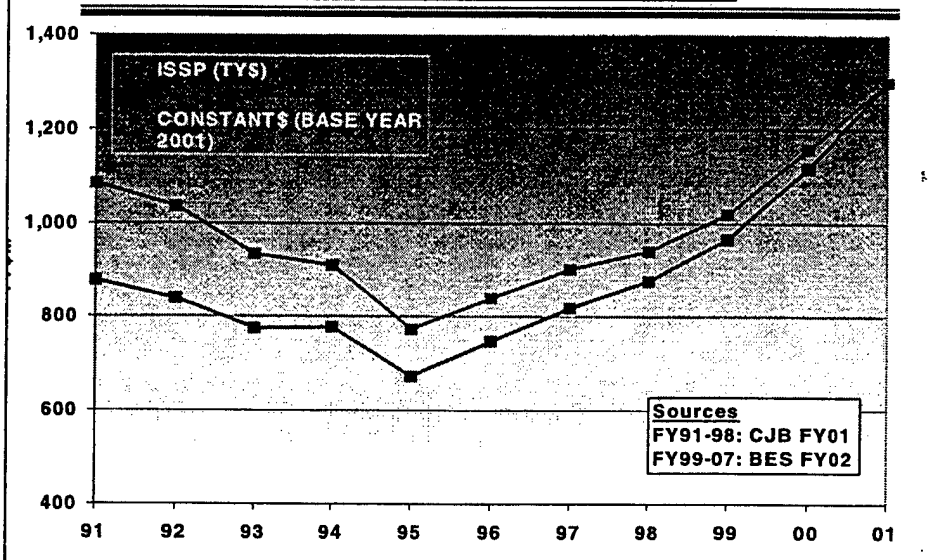
July 2000

David Wilcox
DIAP
703.604.0500
david.wilcox@osd.pentagon.mil

- How much is the DoD spending on IA?
- How much does a pound of IA cost?
- What is the real IA requirement?

What We Know ($M)

HISTORICAL TREND OF ISSP RESOURCES

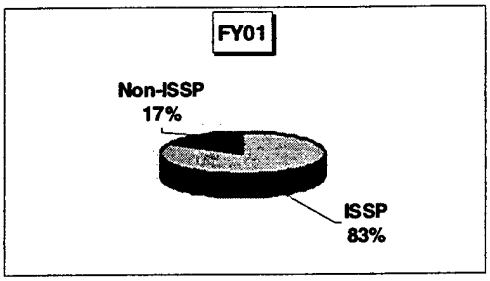


What We Don't Know

- IA costs embedded within acquisition programs/initiatives
- IC Community
- Services use post, camp, station/base operating support funds for IA
- DOD law enforcement (computer crimes, computer forensic lab)

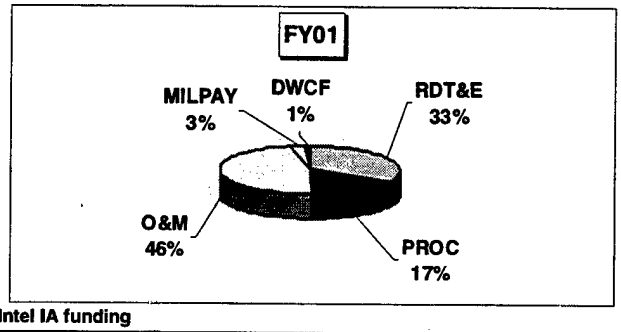
What We Know ($M)

Program	FY99	FY00	FY01
ISSP	966.0	1,115.9	1,299.5
Non-ISSP	113.6	185.9	269.5
TOTAL	1,079.6	1,301.8	1,569.0



What We Know ($M)*

Appropriation Cat	FY99	FY00	FY01
RDT&E	392.4	405.0	517.7
PROC	178.1	226.3	263.7
O&M	462.8	611.6	725.2
MILPAY	42.6	44.7	45.8
DWCF	3.7	14.1	16.0
Surcharge	0.0	0.1	0.6
TOTAL	1,079.6	1,301.8	1,569.0



* Does not include Intel IA funding

What We Know ($M)

Component	FY99	FY00	FY01
Army	113.4	142.0	196.2
Navy	93.7	140.2	161.4
Marine Corps		12.3	20.3
Air Force	116.8	134.3	196.5

1997 DSB IW-D
Recommendation 6.3 (cont'd)

- **Increase Awareness**
  - Establish IW-D awareness campaign for public, industry, CINCs, Services, Agencies

July 2000 Update

IA awareness raised to highest levels throughout DoD
- DepSecDef strong IA proponent
- OASD(C3I)(I&IA) and DIAP active advocates of IA
- Eligible Receiver 97 demonstrated IA impact on operations
- Continuous series of attacks/probes on DoD networks
- USSPACECOM assigned CND/CNA operational mission
- Quality and degree of DoD IA Training/awareness significantly raised
- DoD and Services have "IA Awareness" days and conferences
- Awareness processes exist that engage with industry and academia

FY99	FY00	FY01
14	16	19

1997 DSB IW-D
Recommendation 6.3 (cont'd)

- **Increase Awareness**
  - Expand IW Net Assessment in 1994 Summer Study
  - Review Joint Doctrine for IW-D Emphasis
  - Large scale IW-D demos, understand cascading effects

July 2000 Update

Status and efforts to expand 1994 IW Net Assessment are unknown

OASD(C3I)(Info Ops Strategy & Integration)
- Conducting IO Broad Area Review with DoD Components, including IA
- Services and JS, in conjunction with IO review, are reviewing IO and IA doctrine

Joint Warrior Interoperability Demonstration (JWID)
- Ongoing right now, some IA technologies to be demonstrated

Page 1101 of 3957

1997 DSB IW-D
Recommendation 6.3 (cont'd)

- **Increase Awareness**
  - Develop simulations to demonstrate IW-D effects
  - Implement Policy to include IW-D realism in exercises

July 2000 Update

Components have some modeling and simulation efforts to demonstrate IA effects and to collect data. Most of these efforts reside at NSA

JS is staffing CJCSI 6510.01 to:
- include integration of CND (IA) into joint exercises and wargames
- instruct components to exercise CND in realistic scenarios
- task J7 to ensure IA and CND operations are exercised and coordinated

Components are implementing IA (to varying degrees) into exercises
- INFOCON 99, Blue Flag 00-2, 00-3, UFL, Steel Puma, Power Sweep...

Enabling of applications to utilize a public key infrastructure
- PKE to be resourced from components' programs
- PKE study estimates total resources to PK-Enable 690 applications will be around $175M

National Information Assurance Partnership (NIAP)

FY99	FY00	FY01
3	7	4

1997 DSB IW-D
Recommendation 6.8

- **Establish and maintain a minimum essential information infrastructure**
  - Define options with associated costs and schedules to determine MEII such that infrastructures can failsoft to support critical functions while under attack
  - Define minimum essential conventional *force structure* and supporting *information infrastructure* needs
  - Prioritize critical functions and infrastructure dependencies
  - Design a Defense MEII and a failsafe restoration capability
  - Direct Components to fence funds for Defense MEII and restoration capability

FY99	FY00	FY01
+100	+100	+100

July 2000 Update

Separate & limited efforts ongoing to define MEII.
- CIP office analyzes defense sectors and identify MEIIs, but not all.
- OASD(C3I) is working to define supporting info infrastructure.
- The National Security Telecommunications Advisory Committee (NSTAC) coordinates with industry to assess telecommunications interdependencies for Governmental critical mission operations and may address MEIIs.

Page 1104 of 3957

1997 DSB IW-D
Recommendation 6.9

- **Focus the R&D on following areas:**
  - Robust survivable system architectures
  - Techniques and tools to model large scale distributed network systems
  - Tools for synthesizing & projecting performance of survivable distributed systems
  - Testbeds and simulation-based mechanisms for evaluation of emerging technologies
  - Research in US Computer science and engineering programs
  - Educational programs for curriculum development at undergrad and graduate levels

EXECUTIVE SUMMARY

"We can't solve problems by using the same kind of thinking we used when we created them."

Albert Einstein

The American homeland is becoming increasingly vulnerable to non-traditional attack, including information warfare, the focus of this report. Rapid advances in technology have and will continue to create new vulnerabilities and challenges to U.S. security. Recent studies by both the Government Accounting Office (GAO) and the Computer Security Institute found that the number of cyber security threats to both the government and the private sector is on the rise. The damage caused by a successful attack, both to physical infrastructures and to the psychological health of U.S. institutions, could prove immense, and the Department of Defense is not exempt from this danger.

In many circles within the U.S. defense and broader international security community, the term "information warfare" is increasingly being used to encompass a far greater set of information-age "warfare" concepts than was attributed to it in the past. These emerging new warfare concepts are directly tied to the prospect that the ongoing rapid evolution of cyberspace, the global information infrastructure, could bring both new opportunities and new vulnerabilities. At least one of these vulnerabilities, the prospect that the information revolution could put at risk high-value national assets outside the traditional battlespace boundaries, will affect U.S. national security strategy, and thus U.S. military strategy. The fact that assets that are critical to the conduct of military operations would also be put at risk compounds this problem.

There is an emerging element of information warfare, one that appears to be common to almost all currently evolving uses of the term, which warrants identification and definition. Strategic information warfare, in essence, the intersection of evolving information warfare and post-cold war "strategic warfare" concepts, warrants special recognition and attention as a legitimate new facet of warfare, one with profound implications for both U.S. military strategy as well as overall U.S. national security strategy and policy.

A fundamental aspect of strategic information warfare is that *there is no front line*. Strategic targets in the United States may be just as vulnerable to attack as in-theater command, control, communications, and intelligence targets. As a result, there exists a need for broadening strategic understanding beyond the single traditional regional theater of operations to four distinct separate theaters of operation: 1) the battlefield, 2) the allied or regional zone of the interior, 3) the intercontinental zone of communication and deployment, and 4) the U.S. zone of the interior.

The post-cold war "*over there*" focus contained in the persistent emphasis on the regional component of U.S. military strategy has been rendered incomplete and is of declining relevance to the likely future international strategic environment. When responding to information warfare attacks of this character, military strategy can no longer afford to focus on conducting and supporting operations only in a region of concern.

Page 1114 of 3957

What are the basic features of strategic information warfare as best we understand them today? The following represent a synthesis of observations about these basic features. There is, most definitely, a cascading effect inherent in these observations; each helps to create the enabling conditions for subsequent ones.

1. Low Entry Cost

Interconnected networks may be subject to attack and disruption not just by states but also by non-state actors, including dispersed groups and even individuals due to the low cost of entry. Potential adversaries could also possess a wide range of capabilities. Thus, the threat to U.S. interests could be multiplied substantially and will continue to change as ever more complex systems are developed and requisite expertise is ever more widely diffused.

Cyber attacks have moved beyond the realm of the mischievous teenager and are now being learned and used by terrorist organizations as the latest weapon in a nation's arsenal. In June 1998 and February 1999, the Director of the Central Intelligence Agency testified before Congress that several terrorist organizations believed information warfare to be a low-cost opportunity to support their causes. Both *Presidential Decision Directive 63* (PDD-63) issued in May 1998 and the *President's National Plan for Information Systems Protection*, version 1.0, issued in January 2000, call on the legislative branch to build the necessary framework to encourage information sharing to address cyber security threats to our nation's privately held critical infrastructure.[1]

Effective attribution and swift response to attacks would nullify the appeal of the low cost of entry by making the chances of "getting caught" much higher. Perceived increased risk by the attacker should be an added deterrent to preventing information warfare attacks.

2. Blurred Traditional Boundaries

Given the wide array of possible opponents, weapons, and strategies, it becomes increasingly difficult to distinguish between foreign and domestic sources of information warfare threats and actions. We may not know who is under attack by whom, or who is in charge of the attack. This greatly complicates the traditional role distinction between domestic law enforcement, on the one hand, and national security and intelligence entities on the other.

Not only are borders becoming more porous, but they are increasingly irrelevant in cyberspace. According to a long-time CIA operative and FBI consultant, "Globalization and technology were lowering traditional boundaries between what constitutes an international or domestic threat, and terrorists, drug cartels, spies, and hackers were all leaping those boundaries with impunity."[2]

3. Expanded Role For Perception Management

Opportunities for information warfare agents to manipulate information that is essential to public perceptions may increase. For example, political action groups and other non-government organizations can use the Internet to galvanize political support, as the Zapitistas in Chiapas,

---

1 Statement of Representative Tom Davis on the Introduction of The Cyber Security Information Act of 2000, April 12, 2000.

2 John McGaffin, in Covert Counterattack, by James Kitfield, National Journal, September 16, 2000, pg. 2858.

Mexico, were able to do. Furthermore, the possibility arises that the very "facts" of an event can be manipulated via multimedia techniques and widely disseminated. Conversely, there may be decreased capability to build and maintain domestic support for controversial political actions. One clear implication is that future U.S. administrations may include a robust Internet component as part of any public information campaign.

4. Lack Of Strategic Intelligence

For a variety of reasons, traditional intelligence-gathering and analysis methods will be of limited use in meeting the strategic information warfare challenge. Collection targets will be difficult to identify using existing national technical means; allocation of intelligence resources will be difficult because of the rapidly changing nature of the threat; and vulnerabilities as well as target sets will not be well understood. In sum, the United States may have great difficulty identifying potential adversaries, their intentions, and their capabilities.

5. Difficulty Of Tactical Warning And Attack Assessment

Warning and attack characterization and assessment involving information warfare presents fundamentally new problems in a cyberspace environment. A basic problem exists: distinguishing between attacks and other events such as accidents, system failures, or hacking by thrill seekers. This challenge is exacerbated by the speed of events in cyberspace. The main consequence of this feature is that the United States may not know when an attack is underway, who is attacking, or how the attack is being conducted.

6. Difficulty In Building And Sustaining Coalitions

Many allies and coalition partners will be vulnerable to information warfare attacks on their core information infrastructures. For example, the dependence on cellular phones in developing countries could well render telephone communications in those nations highly susceptible to disruption or deception. Other sectors in the early stages of exploiting the information revolution, such as the energy or financial sectors, may also present vulnerabilities that an adversary might attack to undermine coalition participation. Such attacks might also serve to sever weak links in the execution of coalition plans.

Conversely, tentative coalition partners who urgently need military assistance may want assurances that a United States deployment plan to their region is not vulnerable to information warfare disruption.

7. Vulnerability of the United States Homeland

As stated earlier, information warfare has no front line. Potential battlefields are anywhere networked systems allow access. Current trends suggest that the United States economy will rely on increasingly complex, interconnected network control systems for such necessities as oil and gas distribution management, electric grids, telephone service, air traffic control, and much, much more. The vulnerability of these systems is currently poorly understood. This lack of understanding and recognition inhibits a thorough assessment of the vulnerabilities that may exist in both the technology-driven control systems and in the fiscal marketing processes that can directly affect energy distribution. In addition, the means of deterrence and retaliation are uncertain and may rely on traditional military instruments in addition to information warfare

threats. In summary, the United States homeland may no longer provide a sanctuary from outside attack.

The U.S. concept of national security must adapt to this changing world. The existing national security decision-making and execution apparatus is not well suited to ensure this type of security. Among other things, the apparatus that is needed must be able to:

- Act quickly, avoiding the delays of inter-agency processes, yet represent appropriate concerns
- Deal with threats functionally instead of geographically
- Bring law enforcement, national defense, and intelligence functions to bear on a threat seamlessly without endangering civil liberties
- Engage with the private sector

Rebuilding the national security apparatus cannot be done in one step. The bipartisan Commission on National Security in the 21st Century has begun to address this problem. It must evolve and adapt as the world changes. The key will be to create a flexible, agile, adaptive apparatus that embraces experimentation and keeps what works.

In the interim, this panel submits a series of recommendations, grouped into four areas, the implementation of which would go a long way to meet the emerging information warfare threat. The panel believes that actions taken in the near term would materially benefit the effective execution of Defensive Information Operations (DIO) within the Department.

RECOMMENDATION 1

Create an Executive Order (EO) on Common DIO Terminology

Multiple definitions for the same DIO-related terms are in wide usage within DoD, DOJ, and the Intelligence Community (IC). The absence of common definitions produces differing interpretations of authorities and knee-jerk reactions in both the private sector and the legal community, e.g., monitoring, attack, armed attack, etc. This decreases the likelihood of coordination and increases the potential for confusion and turf battles. We believe the problem can be solved by using existing mechanisms without changing current laws, policies; and regulations. The recently signed Presidential Review Directive (PRD) will institute an Interagency Working Group (IWG) process that will help.

The SecDef and the Director of the Critical Infrastructure Assurance Office (CIAO) should jointly sponsor an effort to produce an authoritative document (perhaps an EO) containing the maximum number of DIO-related terms, which would be useful to Information Assurance (IA) in a national, DoD, civil agency, and civil context.

Page 1117 of 3957

RECOMMENDATION 2

Establish a National DIO Coordinator

The nation has no means of providing either tactical Indications and Warning (I&W) of a widespread cyber attack on critical infrastructures or a coordinated response to it. No one is assigned the clear responsibility for rationalizing law enforcement and national defense equities when a cyber attack is detected. There is currently a bias in favor of law enforcement procedures, even if their use impedes response and recovery. There is no governing authority with the responsibility to make response-and-recovery decisions effective across stovepipes. Moreover, coordination often depends on the personalities of those involved.

The SecDef should propose creation of a national DIO coordinator. Initial responsibilities and authorities would be limited to policy and planning, but would increase as the job matures and Congress engages, to potentially include: oversight, direction and control, responsibility for information resource policy and strategic planning and adjudication among agencies.

RECOMMENDATION 3

Identify Critical Infrastructure Dependencies

Critical infrastructures are those systems that are essential to the minimum operations of the economy and government. The critical infrastructures of the United States are predominantly owned by the private sector, and the DoD is extremely dependent upon them. Industry has indicated a willingness to share information with the DoD, but will not necessarily be motivated by the same factors that motivate government. Industry fears regulation and unfunded mandates and will not go beyond what makes financial sense.

DoD must make a concerted effort to identify what is critical in terms of its private sector infrastructure dependencies. The DoD effort to produce sector Critical Infrastructure Protection (CIP) plans was a step in the right direction; however, lack of funding is hindering this action. DoD must energize its local outreach by local DoD installation commanders to build the relationships necessary and to identify dependencies on local commercial and municipal infrastructures.

Page 1118 of 3957

RECOMMENDATION 4

Gain Consensus on DIO Security Standards

There are few information security technical standards to which DoD program managers can turn. Moreover, Global Information Grid (GIG) Information Assurance Technical Architecture Framework (IATF) Standards and Protocols for providing security are inconsistent with the Joint Technical Architecture (JTA).

A clarification memorandum should be issued making it clear the JTA will be adhered to for all GIG implementations, especially in the IA domain. The JTA is the better reference on IA standards and protocols, and it should be referenced as such in all GIG IA policy documents.

CONCLUSIONS

Following the end of the Cold War, and the subsequent changes in the geopolitical climate, the United States now faces a different kind of threat. This threat is characterized by the ability of numerous potential adversaries to engage in an information attack upon the United States, enabled by the lower entry costs associated with such an attack. Further, an attack could be at a lower threshold as a concerted effort to undermine or gradually erode our strategic or tactical position, our economic strength and fiscal processes, societal confidence in our government's ability to respond to crisis, or other less traditional targets. America's ability to attribute and respond is woefully insufficient to pose a significant deterrent to would be-attackers. And on the other end of the spectrum, early tactical indications and warning capabilities are virtually non-existent in cyberspace. These factors converge to create a newly and differently vulnerable United States homeland.

It is our contention that immediate actions can work to decrease the threat and potential damage to United States national security, including infrastructures, institutions, and individuals. The United States national security apparatus must continue to evolve over time to deal with these emerging trans-national threats, including trans-boundary threats where the differences between law enforcement and national defense, between foreign and domestic, between national and transnational, and between government and civilian are increasingly irrelevant. In the interim, there are a few discrete policy related actions we as a nation and military institution should take:

- We all need to be able to speak the same language and should take action toward a common DIO-related lexicon.
- Someone needs to be in charge to ensure government-wide coordination.
- We need to identify our dependencies on and protect our critical infrastructures.
- DOD systems developers need a single source for DIO security standards.

Page 1119 of 3957

I. TOWARD A COMMON TERMINOLOGY

New technologies and new concepts inevitably require new terminology. Unfortunately, terminology and definitions related to DIO vary widely throughout government and the private sector. DoD has expended considerable effort to standardize Information Operations (IO) related definitions, but differences and controversy remain. The Intelligence Community (IC) and DoD, in spite of a great incentive to share definitions, have managed to formally agree on only about a dozen. Industry and the private sector use a wide variety of definitions depending on convenience and circumstance, and these often differ from those within the IC and DoD.

How one defines a concept or an action has a direct bearing on which laws may be applicable to a situation and which authorities may hold sway. It may also affect how actions are funded. Consequently, definitional issues often masquerade as surrogates for deeper struggles over turf and resources.

The situation is made more complicated by the fact that some terms arrive on the scene laden with semiotic baggage. For example, "monitoring," means one thing to the National Security Administration (NSA) in a foreign intelligence context, another to the FBI in its law enforcement role, and something quite different to the ACLU when discussing the Fourth Amendment. Likewise, the term "attack" may mean to destroy, to penetrate for purposes of monitoring, to trace back for purposes of defense, or to temporarily disable, depending on who is conducting the "attack" and the intent of his or her actions.

Fortunately, the law does not need to be changed to create a common lexicon and direct its use throughout government. Most, if not all, of the problems associated with definitions can be solved using existing processes and organizations. However, a necessary precondition of such a lexicon would be an improved consensus on authorities, roles, and responsibilities to perform DIO. The process of building a common lexicon would force many such issues into the open for discussion and resolution. Additionally, if such a lexicon were developed with utility to the civil sector in mind, it might have the added benefit of helping industry consolidate its efforts to defend critical infrastructures.

A Presidential Review Directive (PRD) has recently been signed, which calls for an Interagency Working Group (IWG) to reach consensus on several matters important to IO in general and DIO in particular. Doing so will do much to clarify roles and responsibilities. The subject of definitions is among the matters to be discussed, but the PRD stops short of calling for a comprehensive common lexicon to be used throughout government.

FINDINGS

- Multiple definitions exist for common DIO-related terms. This is so within both DoD and the IC. The law enforcement community, the private sector, and the rest of government use either their own terms for DIO-related concepts or create new ones as the need arises.
- Within DoD and the IC, the use of multiple definitions for the same concept has the potential to cause operational confusion. Outside of DoD and the IC, the use of

Page 1120 of 3957

multiple terms can exacerbate problems associated with overlapping authorities and complicate efforts to coordinate a response to an attack.

  - The absence of common definitions produces differing interpretations of authorities and differing ideas about the purpose of an action. This can be particularly troublesome when particular words (e.g., monitoring) have widely accepted meanings in the private sector and legal communities, which are based on case law or popular misconceptions.

- A common lexicon would not only facilitate mutual efforts to defend infrastructures, but it would help clarify authorities, roles, and responsibilities as well.
- Creating a common lexicon of useful DIO terms would not require changes to law, policy or regulation. Existing mechanisms and organizations are sufficient to mandate and develop such a lexicon.
- The challenge will be to reach out beyond DoD and the IC to include the private sector, the law enforcement community, and the rest of government in the process. For this reason, the effort requires sponsorship at the National Security Council (NSC), National Economic Council (NEC), or Executive Office of the President (EOP) level.

RECOMMENDATIONS

- SecDef and the Director of the CIAO should jointly sponsor an effort to produce an authoritative document (perhaps an Executive Order) containing DIO-related terms, which would be useful in both the national security and civil sectors of government. This effort should draw upon the work of the IWG established by the PRD on IO.
- To assist this effort, the following Office of the Secretary of Defense (OSD) actions should be undertaken:
  - DOD & IC General Counsels (GCs) should work with the DOJ to develop a common concept for and set of terms to be used when conducting "investigations" in cyberspace.
  - The Bilateral IO Steering Group (BIOSG) should create a joint DOD/IC working group to produce the largest possible set of common IO-related definitions. The term DIO should be included.
  - USD(P) should initiate a dialogue with the State Department and the Office of Management and Budget (OMB) regarding common DIO definitions. The goal of these talks would be to encourage the use of common DIO-related terms throughout top levels of government, the international community, and the DoD.

Page 1121 of 3957

II. REQUIREMENT FOR GOVERNMENT-WIDE COORDINATION

Prior to the Information Age, protecting the nation from external attack was clearly the province of the DoD, supported by the IC. Law enforcement assisted with counter-intelligence efforts and other domestic responsibilities. The situation is more complex today. An attacker in cyberspace may do harm to our critical infrastructures without our knowing his identity or location. The infrastructures he is attacking may be private property and not clearly under the purview of the national security apparatus. Similarly, uncertainty about the origin, severity, and target of an attack may lead to confusion over whose authorities are preeminent in responding to it. Obviously, coordination becomes critical in such circumstances.

Warning is another issue that will be seen through different lenses in the Information Age. Traditional intelligence collection and analysis methods might provide some measure of *strategic* warning of an IO attack, but the nation has no means of providing *tactical* Indications and Warning (I&W) in cyberspace. In fact, there is no reliable means of even detecting a widespread, subtle, "slow and low" attack, let alone warning of it. Some would argue that such an attack is already ongoing. Even if an attack were detected, there is no consistent, widely understood process for reacting to it or recovering from its effects. Furthermore, there are no formal mechanisms for balancing equities between law enforcement and national security when reacting to it.

Any cyber I&W effort will require visibility into a large number of domestic networks, if not for content, at least to characterize the health of their operations. Obviously, the IC is limited in its ability to perform such a function. Likewise, law enforcement is proscribed from monitoring actions in the absence of compelling legal grounds. Nevertheless, there is much that can be done within existing law, policy, and regulation. (For a more complete discussion of this subject, see the legal section of the report.)

A few systems in government and industry (e.g., monitored command networks and Telecommunications Service Providers) have limited capabilities to detect an attack within their own "stovepipes," but reaction options are limited and local. Coordination and "spreading the word" generally falls to Computer Emergency Response Teams (CERTs) and individual initiative. In no case is there a robust means of characterizing diverse attacks occurring in separate segments of government and industry or of rationalizing large-scale reaction and recovery. The National Information Protection Center (NIPC) was originally created to help coordinate information on such attacks, but has devolved primarily into a cyber-crime investigation body. In fact, the predominant FBI (law enforcement) culture of the NIPC has made information sharing difficult in a practical sense, within government or with industry. As always, well-meaning individuals with initiative have built informal coordination mechanisms, but these are personality dependent.

Since the NIPC, by default, considers a cyber intrusion to be a crime, rules of evidence and strict investigative procedures are applied and information sharing is restricted. This practice, which appears to have little justification in law, biases reactions in favor of law enforcement and

Page 1122 of 3957

stands in the way of effective information sharing and the coordination that would be necessary to mount an effective national defense. Finally, no one is assigned the responsibility or the authority (other than through Cabinet level cooperation) to make the decision that an ongoing attack has progressed from a law enforcement case to a national security matter.

A similar vacuum is seen when one looks for someone in authority to coordinate a recovery from a nationwide or large-scale cyber attack. Obviously, some activities would be covered under standing contingency plans for disaster recovery or continuity of government. Likewise, many segments of industry, (e.g., banking and the stock markets) have elaborate backup and recovery plans. On the other hand, if an attacker were to mount a carefully coordinated assault on several segments of our infrastructure simultaneously, it would be difficult to recover without massive dislocation. For example, if phone service and the power grid were lost at the same time gas lines were disrupted during winter, the combined effect could be catastrophic. Even worse would be a scenario combining such cyber attacks with traditional bomb blasts or the release of a biological agent. It does not take much imagination to see that coordinating a recovery would require difficult tradeoff decisions about whose infrastructure should be recovered first. Questions of liability aside, these hard choices must be made by someone with visibility across infrastructure stovepipes and the authority to compel actions that will affect lives and finances.

As matters stand today, a declaration of martial law might be required to answer the demands of the desperate situation described above. However, a more palatable, more effective, and less costly recovery could be made using the offices of a standing official charged with the responsibility for national critical infrastructure protection. It is true that there is a coordinator for counterterrorism, security and critical infrastructure protection, but realistically his authorities are constrained to his powers of persuasion. Likewise, CINC, Joint Forces Command is charged with homeland national defense, but confusion may arise from the fact that CINCSPACE is responsible for Computer Network Defense. Realistically, neither CINC can do much to prepare for homeland cyber defense without asking hard questions about posse commitatus, the legal aspects of dealing with private industry, and public perceptions of the military taking on such a role in peacetime.

Finally, there is the question of international allies and corporations with close ties to U.S. firms. Geographic boundaries mean little in cyberspace. Effective reaction to and recovery from a serious cyber attack almost certainly will require coordination with allies and foreign partners. Consequently, the State Department must engage on these issues in the immediate future. In fact, State is already involved in several DIO-related matters, such as a Russian proposal to limit work on Information Warfare. As matters progress, State will have to join more fully with the DoD, the IC, and law enforcement communities in coordinating responses to cyber issues.

In sum, the nation needs a well-staffed, designated official with direct access to the principals of the National Security Council (NSC) who is charged to plan for and respond to the type of crisis described above. Perhaps the growing discussion about creating a Federal CIO within the Executive Office of the President will answer these concerns, provided that the position is given the required authorities and that national security matters are coordinated through the NSC. Such an official will require explicit authorities that can only be granted in law by Congress. Consequently, anyone appointed to fulfill these duties will require Congressional confirmation.

Page 1123 of 3957

FINDINGS

- We have no means of providing tactical I&W of a widespread, well-coordinated cyber attack, other than reporting within a few stovepipes (e.g., local telcos and DoD networks).
- There is no clear responsibility for rationalizing law enforcement and national defense equities when certain types of cyber attack are detected.
- There is currently a bias toward using law enforcement authorities and procedures when a cyber incident is detected. Although this will be satisfactory in the vast majority of cases, no formal means exists to review cases to determine if national security procedures might be more appropriate.
- No one has the responsibility or authority to make response and recovery decisions and take actions across stovepipes. Coordination depends on personalities.
- The State Department is potentially very important to DIO, but is not sufficiently engaged.
- A great portion of government does not understand DIO issues or appreciate the potential impact of information technology vulnerabilities on their operations.

RECOMMENDATIONS

- The SecDef should propose the creation of a national DIO coordinator. Prior to congressional action, the Coordinator's authorities will be limited. In the interim, he could serve as the nexus of DIO policy development. Eventually, this individual should sponsor the development of national-level, coordinated DoD/IC/law enforcement mechanisms to provide I&W of a cyber attack, respond to it, and recover from its effects.
- To support this effort the SecDef and DCI should:
  - Create a joint DoD/IC panel to work with the DOJ, NSC, and OMB staffs to draft a DIO Executive Order (EO). The EO should clearly establish the preeminence of the national security response over the law enforcement response in cases having a national security impact.
  - Create a panel to examine EO12333 and other law, policy, and regulations in light of emerging DIO realities.
  - Create a standing GC's working group to monitor legal precedents for decisions useful and inimical to DIO efforts and to explore the latitude available for DIO under existing law.
  - Task the Bilateral IO Steering Group (BIOSG) to propose mechanisms for the military services and the IC to deconflict DIO (especially related to Computer Network Operations).

Page 1124 of 3957

Page 1125 of 3957

III. CRITICAL INFRASTRUCTURE PROTECTION

The Defense Department is increasingly reliant on a broad range of vital infrastructure services provided by the private sector, municipal utilities, and other non-DoD sources. While DoD's communications, energy, transportation, logistics, and supporting requirements grew significantly over recent decades, DoD has become far more dependent on non-DoD-owned and -operated systems and networks. The underlying private sector infrastructures have undergone an explosion in technical capability, complexity, and integration, adopting new technologies and processes, particularly evident in communications and energy infrastructures. This revolution in technology and system interoperability has empowered infrastructure owners and operators to better serve their customers while expanding capabilities and building corporate strength. Technological interoperability, a feature inherent in these infrastructures, was market economy driven, and thus the infrastructures are exceedingly interdependent. As the infrastructures advanced in capability, capacity, and complexity, DoD took advantage of their availability.

Private sector dependencies have direct implications for the availability and reliability of DoD's Global Information Grid (GIG) – leased private sector systems incorporating our nation's fiber optic network, twisted wire, and wireless systems provide the GIG's backbone outside DoD's information infrastructure gateways. The dependencies go much further than this vital information backbone; the breadth of defense operations requires much more energy, logistics, and other vital services than ever before. For DoD to fully understand its private sector dependencies, it must analyze and assess those dependencies, a process that cannot be done without dialogue and partnering with the private sector or municipal owners and operators of those infrastructures.

DoD's expanded use of private sector infrastructures should logically require a more detailed assessment of potential risks inherent in the interdependent, underlying infrastructure. The private sector built and operated these infrastructures while using a very different risk model than those used within DoD. Private sector risk analyses are based on economically driven models, focusing on profitability and customer service, with modernization reliant on anticipated returns on investment. Threats and risks are plausible in peacetime scenarios, where the threats may be backhoes and risks considered are seen as natural disasters or competitive business practices. DOD risk models focus on more sinister threats – where a bad actor or nation state could purposefully deny infrastructure to degrade our global projection of force or otherwise undermine the national security of the United States.

The *Presidential Decision Directive on Critical Infrastructure Protection* (PDD-63, 1998) focused national efforts to implement critical infrastructure solutions, including expanded partnership between government and the private sector. Many national initiatives began, including establishment of the National Infrastructure Protection Center at FBI and the initiation of Infrastructure Sector Analysis Centers (ISACs), attempting to expand partnership between government and the private sector within individual infrastructure sectors. Arguably, though much has been done to advance national CIP efforts, the broad ranging initiatives have not seemed to gel into the desired partnerships, including interagency coordination and partnerships between government and the private sector. Similarly, many agencies and departments have not

Page 1126 of 3957

funded CIP efforts consistently across government. DoD began recognizing its need to consider critical infrastructure issues and proceeded somewhat independently and separately from other government agencies to focus on vital aspects central to DoD.

In 1997, DoD accelerated its exploration of dependencies on non-DoD infrastructures, standing up individual infrastructure sector teams and coordinating them through organizational processes such as the Critical Infrastructure Protection Integration Staff (CIPIS). Administrative and organizational efforts within OSD and the services were supplemented by operational initiatives, such as Joint Service Integrated Vulnerability Assessment (JSIVA) efforts, accelerated Red Teaming, DoD readiness exercises such as Eligible Receiver, and expanded infrastructure initiatives at the Joint Program Office for Special Technology Countermeasures (JPO-STC) and the Defense Threat Reduction Agency (DTRA). Most infrastructure vulnerability assessments focused on our key defense sites and facilities.

The risk environment, especially as it pertains to the critical infrastructures on which DoD relies, has changed. Threats to our homeland are becoming far more real, leading to important explorations of new risks: information warfare, biological and chemical warfare, and unconventional nuclear risks. While the risk environment has evolved, the infrastructures on which we rely, both domestically and in forward-deployed areas, have become more technologically advanced, concentrated in increasingly critical nodes, with complex distribution that DoD may not fully understand. Further, these infrastructures are less within the government's and DoD's control. Market pressures drive technological advancement within these networks, with fiscal realities no longer shaped by government needs.

The potential for a smart adversary to undermine the reliability or availability of our critical infrastructures is increasingly real. In the context of DoD's evolving Global Information Grid backbone, protecting information architectures and their content does not necessarily protect the underlying cyber and physical infrastructures. Similarly, protecting DoD's GIG within the gateways that connect it to private-sector-owned and -operated information infrastructures does not guarantee GIG availability should the leased connectivity outside those gateways be denied.

DoD should accelerate its efforts to identify its private sector dependencies and vulnerabilities, for DoD's information backbone as well as for other infrastructure dependencies that support energy requirements, logistics and transportation, water, and other critical infrastructure reliances. Without broad-based consideration of the full scope of critical infrastructure dependencies, mission constraints are unknown but potentially significant.

Relationship building and the resultant trust takes time. It is likely that both the government and private sector leaders at a localized level have multiple overlapping requirements and interests that contribute to both national security and the corporate prosperity of the infrastructure provider. For the purposes of critical infrastructure protection, it is important that these relationships advance toward the mutual benefits of government interests, including those of national security, and those of the critical infrastructure providers. Accordingly, it is important that efforts taking place at the local DoD installation level to define local dependencies on private infrastructures be explored and assessed in depth. More work needs to be done to identify vulnerabilities outside the lifelines of DoD, yet within the infrastructures on which DoD is very reliant.

Partnership between government and the private sector remains a vitally important yet elusive goal. Efforts to expand partnership with the private sector are hampered in many ways.

Page 1127 of 3957

The private sector sees a lot of the government wrangling and interagency squabbles (some of these indicate the shortfalls in PDD-63 implementation), confusing the infrastructure owners and operators and making it easier to question the government's seriousness in partnering. Further, especially in the context of information sharing among government and the private sector, the owners and operators need relief from Freedom of Information Act (FOIA) to protect their proprietary data and interests and their competitive position.

Industry has indicated a willingness to help, but will not necessarily be motivated by the same things that motivate government. Industry fears regulation and unfunded mandates and will not go beyond what makes financial sense in the market economy. The private sector level of trust in government is low. In particular, the public is least trusting of three specific government sectors. They are law enforcement in particular, and to a lesser degree, the intelligence community and DoD. Government must be willing to openly respond to industry concerns if it hopes to overcome the hurdles in achieving partnership. While the government and the public perceive that industry has the answers, true partnering with industry remains the prime challenge. Best practices within the private sector and within government should be shared, not only as an element of trust and partnering, but to enhance the security and economic implications of infrastructure operability and assurance issues. Partnership challenges will become even more difficult in the future, as companies grow even more global.

FINDINGS

- There is a lack of understanding that it is not enough to simply protect one's own information systems. The DoD depends enormously on the commercially owned and operated telecommunications, transportation, electric power, and gas and oil industries, and on the financial sector.
- The level of trust in government is low. The outreach efforts by the government in the aftermath of PD-63 have not produced an outpouring of trust of government in the private sector.
- Industry has indicated a willingness to help, but will not be motivated by the same things that motivate the government. Industry fears regulation and unfunded mandates and will not go beyond what makes financial sense in the market economy.
- DoD is extremely reliant on private sector systems, networks, and infrastructures. Increased analysis is needed to pinpoint and assure vital reliances on the private sector.
- DoD must partner with the private sector to better protect networks and enhance national security.

RECOMMENDATIONS

- DoD should accelerate actions to identify critical infrastructure dependencies on the private sector – the DoD effort to produce sector CIP plans is a step in the right direction, but we would note that it is not moving along very quickly, primarily due to lack of funding.
- DoD must expand its interactions with the private sector and municipal providers of critical infrastructure services. This is best achieved on a localized level, between

Page 1128 of 3957

base commanders (or other DoD leadership) and the infrastructure owners and operators. Direct DoD installation commanders (with support of JPO-STC) to identify critical infrastructure vulnerabilities, assess mission impact, and take corrective action with private sector service providers.

- DoD should work with Sector Lead Agencies to ensure that its requirements are incorporated into the information-sharing processes with the owners and operators of critical infrastructure.
- Advocate FOIA and other related legal relief to remove impediments to private sector information sharing.
- Fund and resource JPO-STC appropriately to support critical infrastructure assessments. As a minimum starting point, increase funding for such focused efforts to at least $25M per year.
- DoD should modify or develop a process to assess the fiscal impact of infrastructure impact.

Page 1129 of 3957

VI. SECURITY STANDARDS

During the course of this DSB Task Force, it became increasingly clear that, as with the definitional issues addressed earlier, understandings regarding use of information technology standards for desktop, system, and network security mean different things to different people--so much so that in the same organization responsible for promulgating the JTA, a new document, the Information Assurance Technical Architecture Framework (IATF), was developed for the purpose of setting forth guidance with respect to IA standards for the Global Information Grid (GIG).

The IATF document is a tutorial and collection of useful generic information on Information Assurance (IA). It should be noted, however, that the section of the IATF associated with standards and protocols for providing security to system applications is incorrect and inconsistent with the JTA.

The IATF, unlike the JTA, is not a standards setting or selection activity. Rather, the IATF Forum has been organized to encourage participation by vendors of largely commercial off-the-shelf (COTS) IA products and services. The major focus of the IATF is the development of protection profiles (under the Common Criteria [CC]) that will be used to evaluate products, e.g., under the National Information Assurance Partnership (NIAP) program operated by the National Intelligence Support Team (NIST) and the National Security Administration (NSA). There is no unified architectural underpinning for the IATF. This is to be expected, i.e., security evaluation criteria such as the CC (and product profiles based on the CC) tend to be architecture independent. As a result, the collection of standards cited by the IATF in their briefing to our panel lacks architectural continuity and it is not an appropriate alternative to the work of the JTA.

Many of the standards that are lumped together are experimental or dead. For example, S-HTTP is not implemented in any commercial browsers or servers; it lost the protocol battle to SSL/TLS. SPKI is not a standard, but rather is the experimental output of a failed Internet Engineering Task Force (IETF) working group, not supported in commercial products. The PKIX WG of the IETF produces standards based on X.509, which are implemented in a wide variety of products. Moreover, the other IETF security protocol working groups make use of the PKIX standards, not SPKI.

The IATF referenced a wide range of security labeling standards that are a mix of redundant and/or superceded documents. The IATF thus suffers from the same problems associated with the TAFIM; it is a collection of history and general information--not a document that can be used to implement interoperable, secured information systems for DoD. Figure 1 shows the numerous protocols issued as guidance in the IATF, most of which are inconsistent with the JTA.

Page 1130 of 3957

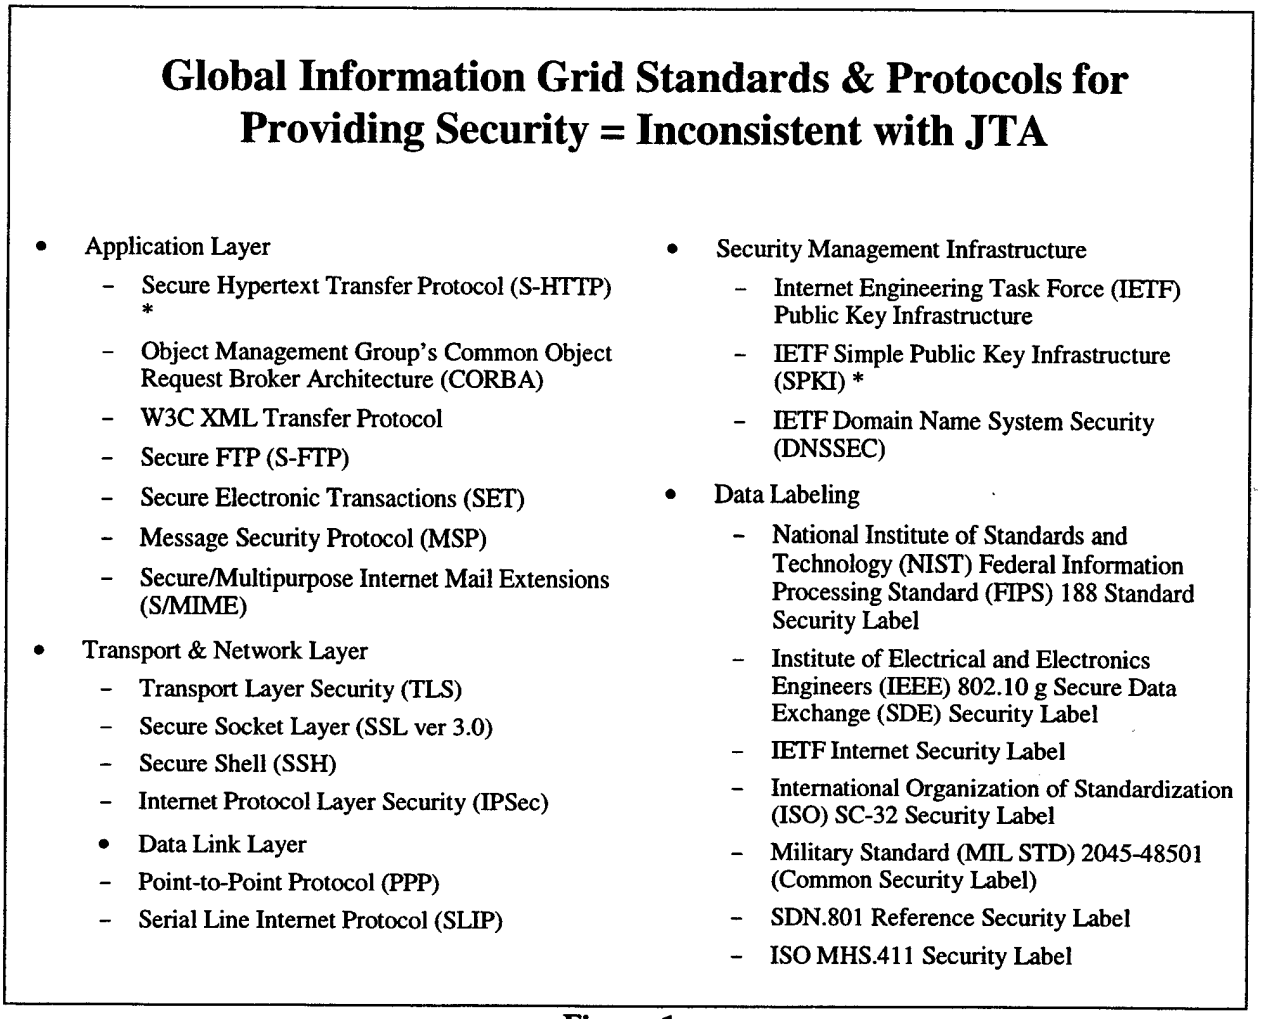

Figure 1.

DoD policy requires that the Joint Technical Architecture (JTA) be used as the "building code" for the DoD information infrastructure. On the other hand, the recent document from the Deputy Secretary of Defense, "Department of Defense Chief Information Officer Guidance and Policy Memorandum no. 68510," Department of Defense Global Information Grid Information Assurance (ASD/C3I), suggests that the IATF and published Common Criteria Protection Profiles be consulted "for guidance, and IA solutions to be considered to counter attacks." A major concern is the apparent confusion these two policy statements could cause within the IA community.

There is an urgent need to provide JTA education to all personnel working with the GIG architecture. Though the IATF effort may be viewed as being helpful in several ways, such as documenting what is available in the commercial sector and what has not survived the "test of time," the JTA should be positioned as the compelling document for guiding the use of standards within the GIG. Commercial standards should be used for security in the GIG wherever practical; however, there will be DoD-unique requirements for certain security implementations not available from the commercial sector. For this reason, we support the R&D/technology

initiatives documented in the Technology chapter of the DIO Task Force report as well as the recommendations put forth by the Architecture Panel of the DIO Task Force.

FINDINGS

- The IATF suffers from the same problems associated with the TAFIM; it is a collection of history and general information—the IATF is not a document that can be used to implement interoperable, secured information systems for DoD.
- The IATF standards are incorrect and inconsistent with the JTA and private sector practice.

RECOMMENDATIONS

- A clarification memorandum should be issued making it clear that the JTA will be adhered to for all GIG implementations, especially in the IA domain.
- The JTA is the better reference on IA standards and protocols, and it should be referenced as such in all GIG IA policy documents.

EXECUTIVE SUMMARY

"Yesterday, December 7, 1941 – a date which will live in infamy – U.S. forces in Pearl Harbor suffered numerous criminal trespasses. I have mobilized a team of prosecutors and FBI agents to investigate and take action."

In 1941, FDR never even considered giving that speech. Today, he might have to.

If critical U.S. information networks were attacked tomorrow in an "electronic Pearl Harbor," FBI agents and Justice Department prosecutors would in fact be on the front lines. Unfortunately, this report concludes, law enforcement and national security agencies have not learned to work together well to defend against attacks on U.S. information networks. Legal and cultural roadblocks have made it difficult for the Defense Department to rely on the FBI and Justice for full information about potentially dangerous attacks. This report proposes an agenda for new leadership and new compromises to break through these roadblocks.

THE OVERLAPPING OF NATIONAL SECURITY AND LAW ENFORCEMENT MISSIONS

Why have Justice Department entities like the FBI assumed such a large role in defending against network attacks? In a word, because attacks on American networks are typically the work of hackers, not foreign states. They are crimes, nothing more.

But that will change, and soon. Hackers' tools will become weapons in the hands of hostile nations, because U.S. information systems are a tempting target, especially for countries that cannot confront our armed forces directly. Network attacks are anonymous – or at least deniable. They are asymmetric. They allow hostile nations to pick a battlefield that minimizes American strengths in conventional and nuclear forces – indeed, one that turns strength into weakness by exploiting the United States' unique dependence on computer networks. The next Saddam Hussein – or the current one, for that matter – could win a symbolic victory just by tying up Manhattan traffic for a day. But some believe network attacks will soon be able to cause deaths and chaos across the country – especially if offensive capabilities continue to outpace our defenses.

In short, network attacks have a national security as well as a law enforcement dimension. DoD must be involved, both because it has a responsibility to defend the country and because it depends so heavily on a civilian infrastructure that is particularly vulnerable to network attacks. But DoD cannot act alone; it may not be possible to tell at the start of an attack whether the matter can be treated as a crime or an act of war or something in between. This means that the defense, intelligence, and law enforcement communities must be prepared to work together in a smooth and coordinated way.

Based on what the task force has seen, that day is a long way off. While they have been quick to take the lead in protecting information networks, the Justice Department and the FBI

Page 1140 of 3957

have been slower to recognize the need for cooperation with the Defense Department and other national security agencies.

WHY INFORMATION SHARING IS SO IMPORTANT

This tendency toward limited information sharing has harmed the country's preparations for attacks on U.S. critical information infrastructure. The first order of business in preparing to defend against network attacks is to gather information about the attacks now being mounted against U.S. information systems. The more we know about today's attacks, the better prepared we will be to deal with tomorrow's. Information warfare cannot be launched blindly. Like any weapon, it must be tested. Indeed, to be most effective, information warfare should be planned and preliminary intrusions should be launched years before an overt attack – defenses must be probed, vulnerable systems reconnoitered, logic bombs planted. To judge the extent of the danger, we should be watching intently for just such activities – sifting those patterns from the noise of "script kiddy" hackers. We should be alert for the subtle signals that governments and terrorists are in fact beginning to turn the theory of information warfare into practice.

Thus, gathering information about the kinds of attacks now being launched is the crucial first step of any defensive effort. Unfortunately, this task has become the subject not of effective initiative but of continuing political and bureaucratic conflict. Although it has responsibility for national defense, the Defense Department must rely on law enforcement agencies such as the FBI and the Justice Department to gather information about network attacks and then decide what DoD needs to know. Thus far, however, the FBI and the Justice Department have been far too focused on their own missions to provide the kind of information sharing that DoD needs.

WHY INFORMATION-SHARING IS SO HARD

The FBI is the principal "intake point" for information about network attacks, in large part because it is easy to use the tools of criminal investigation to gather information about an attack, especially in its early stages. That is why the National Infrastructure Protection Center (NIPC) was housed within the FBI. Although staffed by defense and intelligence personnel as well as FBI agents, it relies heavily on criminal investigative tools that could not easily be deployed by other agencies.

But the effectiveness of NIPC in protecting national security depends on sharing information about attacks, and the FBI has a remarkably bad reputation on that score. A wide range of different communities – local police, intelligence analysts, civilian agencies, and business executives – all complain with regularity that however much information they share with the Bureau, the Bureau never reciprocates.

The NIPC has struggled to avoid the same reputation, but the culture of reticence cannot be turned on and off, particularly when the Justice Department, for its own reasons, has raised additional barriers to information sharing with defense and intelligence agencies. To some extent, the atmospherics surrounding the dialogue between the NIPC and the agencies it supports has made it difficult to arrive at ground truth, but the task force believes that what it has found warrants action. Without substantial improvement, the NIPC cannot live up to its initial promise.

As things now stand, DoD cannot count on NIPC, Justice, or the FBI for a free flow of information about network attacks. On the contrary, the task force identified numerous policies and legal interpretations at NIPC, the FBI, and the Justice Department that have prevented

Page 1141 of 3957

effective information sharing about potential national security risks. The task force concludes that these barriers must be swept away, and soon, if DoD is to continue to support and rely upon NIPC. Unless NIPC, FBI, and Justice overcome their narrow crime-fighting perspectives – in a formal high-level agreement with the Defense Department – then DoD and the intelligence community should pull out of NIPC and create an independent center for gathering and sharing information about the most serious network attacks. This should, however, in the view of the task force, clearly be a measure of last resort.

RECOMMENDATIONS FOR THE DEFENSE DEPARTMENT AND THE JUSTICE DEPARTMENT

Rather than splinter the government's limited resources further, the task force recommends several specific changes in the policies and legal interpretations that have prevented NIPC from achieving its full potential as an information-sharing center. It is the view of the task force that the necessary changes cannot be achieved without leadership from the very top of both departments, and that the issues raised below should form the agenda for a series of talks that will, we hope, culminate in a new agreement over information sharing between the law enforcement and national security communities.

- First, all information available to NIPC should also be available to defense and intelligence analysts (who are already trusted with rather more sensitive information) unless there is an express legal bar on sharing or an *interagency* consensus that sharing the information is imprudent. The task force found that there may be misperceptions about the "law enforcement sensitive" label that is placed on information flowing from the NIPC to the Department. The Justice Department should clarify for the department that the label is attached to sensitize its readers rather than to prevent its flow to those requiring the information within the department. Likewise, the task force also believes that DoD agencies (including NSA) should share all available information on events with the NIPC.

- Second, the Justice Department has blocked NIPC from easy and natural communication with the National Security Council (NSC) about infrastructure attacks, despite the NSC's central role in national security decision making generally and infrastructure protection in particular. The DoJ is plainly reluctant to share information about criminal investigations with White House personnel, but DoJ's general policy, should not be applied to information about network attacks.

- Third, DoD should have access to information about network attacks gathered under Title III (the wiretap statute). The Justice Department opinion refusing to provide this access shows little appreciation of the need for interagency cooperation on national security matters and should be reconsidered.

- Fourth, concerns about grand jury secrecy have made it difficult to know what material in a criminal investigative file may be shared with DoD and what may not. These concerns are mostly derived from very conservative readings of the rules on grand jury secrecy (readings adopted in part to serve the prosecutors' interest in avoiding public disclosures of their investigative priorities). They are also derived in part from the Justice Department's failure to discipline investigators of infrastructure attacks. These investigators could gather information without using grand jury

subpoenas and thereby avoid later information sharing difficulties, but the FBI and Justice Department do not require their investigators to use these less problematic tools in the first instance. The rules on sharing grand jury information should be clarified to permit sharing for national security purposes; until this is accomplished, computer crime investigators should be prohibited from using grand jury subpoenas without interagency approval. While the amount of grand jury material that has been withheld is disputed, and may be relatively small, the failure to address this issue continues to create tension.

- Fifth, NIPC is buried so deep in the Justice and FBI bureaucracy that it cannot perform its interagency role effectively because it cannot assure its counterparts in other agencies that decisions can be rapidly referred to high levels in the bureau and the Justice Department. NIPC should report directly to the Office of the Director FBI as well as the Office of the Deputy Attorney General.

- Sixth, DoD has not taken all the steps necessary to ensure a large and strong contingent of DoD detailees at NIPC. Assuming a successful resolution of the issues raised in this report, DoD should upgrade its contribution to NIPC, both in numbers and in quality, and it should treat NIPC service as a "joint" appointment for purposes of military promotion.

- Seventh, NIPC has much to offer DoD on questions such as when to block a particular hacker from further access and when to let the hacker continue in an effort to learn more about his techniques and purposes. DoD should agree on a role that clarifies NIPC's purely advisory position while guaranteeing that NIPC has a voice in such decisions. DoD should further clarify the commander's decision-making authority in this area so that responsibility is unambiguous.

- Eighth, NIPC and the Justice Department's computer crime experts have exceeded their jurisdiction in trying to limit what information intelligence agencies may receive; neither NIPC nor the Justice Department's Criminal Division should have a role in deciding whether and how DoD entities share information with NSA or other intelligence agencies.

- Finally, the task force notes that "red team" exercises, though vital, have been slowed in the past by multiple legal signoffs and supervision at DoD. This concern is diminishing as red teaming becomes more common, but it remains true that a standardized and simple set of procedures should be adopted to allow unannounced "red team" attacks on all DoD networks without excessive high-level intervention by DoD officials.

RECOMMENDATIONS FOR CONGRESS

All of the recommendations above could be implemented without changing any statute. That is the preferred solution. Nonetheless, there are areas in which U.S. laws have failed to anticipate the need for effective critical infrastructure protection. For that reason, the task force

Page 1143 of 3957

recommends that the Defense Department support a variety of relatively limited changes in existing law.

- Most important, DoD should have its own civil authority to seek information about network attacks with national security implications. Under existing law, network service providers may give away information about hacking attacks on street corners, but they are legally prohibited from giving the information to a government agency unless the agency begins a criminal investigation. This is unfortunate for all. It forces hacker investigations into a criminal posture, which is likely to be bad for the hacker as well as for the opportunity to share information among agencies. The government should justify any request for information about its citizens, but it should not have to launch a criminal investigation before it can gather information needed to protect national security.

- Second, the task force encountered a disturbing limitation in the ability of the government to maintain wiretap coverage of persons engaged in long-term hacking campaigns against government networks. Ironically, the more likely it is that the attackers are sponsored by foreign governments, the less likely it is that wiretap coverage will be maintained, because the likelihood of successful prosecution will decline over time. In the end, criminal wiretap authorities are inadequate for this problem, and a statutory solution should be sought that protects both national security and the civil liberties of Americans. One possibility is a provision denying network trespassers an expectation of privacy for their actions in attacking a victim's information system.

- Third, current law concerning "trap-and-trace" orders often requires that law enforcement agencies seek multiple, sequential orders as they trace a single hacker from system to system. This provision should be modified to allow a single, nationwide order aimed at a single attacker who uses multiple computer systems. In addition, there is currently no statutory provision allowing the government to obtain certain types of information without the requisite order in situations of extreme urgency. This is an oddity, since under the Electronic Communications Privacy Act, wiretaps may be initiated without a judicial order in an "emergency situation." In the interest of enabling law enforcement officials to obtain the crucial information they need for the prompt investigation of critical infrastructure attacks, the provision allowing emergency wiretaps should be extended to court orders and subpoenas as well.

- Fourth, if agreement cannot be reached with the Justice Department concerning the Title III and grand jury rules that currently restrict information sharing with DoD, Congress should clarify its intent that the confidentiality of criminal investigations not trump the national security interests of the United States.

- Finally, though the majority of the problems outlined here focus on information-sharing deficiencies between and among government agencies, greater efforts could be made to encourage voluntary private-sector cooperation in hacking investigations.

Page 1144 of 3957

To this end, the use of nondisclosure agreements in gathering information on network attacks should be expanded, and narrowly tailored legislation that would restrict the Freedom of Information Act disclosure of information shared pursuant to a hacking investigation should be considered.

Page 1145 of 3957

I. INTRODUCTION: WHY SHARING INFORMATION ABOUT NETWORK ATTACKS IS IMPORTANT – AND HARD TO ACHIEVE

Like everyone else in America, the armed forces depend heavily on sophisticated communications networks – not just their own, but those of the civilian industries that support them. U.S. adversaries know this. That is why information warfare attacks on our networks are a near certainty – because they are likely to work. How great is this risk? We do not know, and this panel report focuses on what we don't know, and why.

We do know that attackers have had disturbing success in penetrating sensitive systems essential to carrying out the Defense Department's mission. Worse, the attackers who have succeeded are mostly vandals and petty criminals, and the tools they have used are offshoots of existing technology. But no one estimates the military might of the United States by studying the weaponry of American street criminals, and by the same token, the technology of information warfare will soon bear little resemblance to the viruses and denials of service that currently annoy Internet users. The problem is likely to get worse before it gets better.

Better information about network attacks is the first line of defense. To launch a serious information warfare attack on the United States would likely require considerable preparation – probing defenses, testing tactics, leaving behind logic bombs or back doors. If the government is to have warning of future attacks, it needs to gather information about current attacks in a systematic way and to analyze the information for patterns.
